Total increase in federal district, \$133,652.37.

In a personal conversation with President Diaz, he outlined a plan for the increase in the pay of the army and a material reduction in the number of men employed, which will greatly better the class of soldiery and be productive of benefit to the Republic in every way. There are various matters somewhat beyond the scope of this report, which I shall treat of hereafter in special communications to the Department. Some of them are reports that some of the departments here have been good enough to offer to prepare especially for the United States Government. Some of them are matters that I think worthy of attention, and on which I am now preparing data from various sources.

> ANDREW D. BARLOW, Consul-General.

MEXICO, November 23, 1898.

COLONIZATION AND NATURALIZATION LAWS OF THE REPUBLIC OF MEXICO.

# CHAPTER I.—Of the survey of lands.

ART. 1. With the object of obtaining the lands necessary for the establishment of colonists, the Executive shall cause to be surveyed, measured, subdivided, and appraised, the public or national lands which may exist in the Republic, nominating for this purpose the body of engineers which he may consider necessary, and determining the system of operations which are to be followed.

ART. 2. The subdivisions shall in no case exceed 2,500 hectares, this being the greatest area which can be adjudicated to a single individual of age and with the legal

capacity to make contracts.

ART. 3. The lands surveyed, measured, subdivided, and appraised shall be ceded to foreign immigrants and to the citizens of the Republic who may wish to establish themselves upon them as colonists, under the following conditions:

I. By sale, at the value of the appraisement made by the engineers and approved by the department of fomento, in installments covering ten years, commencing from

the second year of the settlement of the colonist.

II. By sale, making the full payment in cash, or in less terms than those mentioned

in the previous section.

III. Under a gratuitons title, when the colonist may solicit it; but in this case, the area shall not exceed 100 hectares, nor shall be obtain the title except when he may be justified in that he has preserved the property in his power and has cultivated it, in

whole or in part not less than the tenth part, during five consecutive years.

ART. 4. As soon as the Executive may have the lands suitable for colonization purposes, with the conditions which Article 1 establishes, he shall determine which are to be colonized at once, publishing the plan of them and the prices at which they may be sold, endeavoring in every case that the sale or cession to which the previous article refers may be made in alternate lots. The rest of the lands shall be reserved to be sold under the conditions which this law establishes, when they may be solicited, or when the Executive may determine to do so, who can hypothecate them with the object of obtaining funds which, together with the proceeds of the sale of the lands, have to be applied exclusively to carrying out the scheme of colonization.

### CHAPTER II.—Of the colonists.

ART. 5. In order to come under the head of a colonist and to have the right to the franchises which the present law grants, the immigrant who is a foreigner must come to the Republic with a certificate from the consular or immigration agent, issued at the solicitation of such immigrant, or of the company or concern authorized by the Executive to bring colonists to the Republic.

If the soliciting party reside in the Republic, he must apply to the department of

one to the agents of such department, who may be authorized to admit colonists to the colonies which may be founded in the Republic.

ART. 6. In every case, the soliciting parties have to present certificates from the respective officials certifying as to their good habits and business which they have been engaged in before making the application to be admitted as colonists.

ART. 7. The colonists who may establish themselves in the Republic will enjoy for the very counted from the date of their certablishment the following exemptions

ten years, counted from the date of their establishment, the following exemptions and privileges:

I. Exemption from military service.

II. Exemption from all class of taxes, except municipal.

III. Exemption from import and interior duties on provisions, agricultural implements, tools, machinery, chattels, construction materials for houses, furniture for use, and breeding or blooded animals of pure blood devoted to the use of the colonies.

IV. Personal and untransferable exemption from export duties upon the fruits

which they may produce.

V. Premiums for notable labors, and bounties and especial protection for the intro-

duction of a new method of cultivation or industry.

VI. Exemption from the dues of legalization of signatures and the issuance of pass-ports which the consular agents may grant to the individuals who may come to the Republic as colonists, in virtue of the contracts made by the Government with any

company or companies.

ART. 8. The department of fomento shall determine the quantity and class of goods which, in each case, may be introduced free of duties; and the department or finance shall regulate the manner of making the introductions, in order to prevent fraud or smuggling; however, without impeding the prompt dispatch of the goods.

ART. 9. The colonists who may establish themselves upon lands bare of trees and who may prove that on a part of their lands, not less than a tenth part, they have planted trees to an amount proportioned to the area two years before the termina-tion of the period of exemptions, will enjoy the right of immunity from taxation of the lands fc. one year more, and, in general, they will have a year more of exemption for each tenth part upon which they may plant forests.

ART. 10. The colonies shall be established under the municipal management, being subject, for the election of its officials and for the establishment of taxes, to the general laws of the Republic and those of the State wherein they may be found. The department of fomento can, nevertheless, establish agents in the colonies, with the object of giving better direction to the labors and of exacting the reimbursement of the sums which may be owing to the federation under whatever character.

ART. 11. The colonists shall be obliged to complete the contracts which they may make with the federal Government, or with the individuals or companies which may

transport and establish them in the Republic.

ART. 12. Every foreign immigrant who may establish himself in a colony shall indicate in the act of establishing himself, before the federal agent of colonization or before the respective notary or judge, if he intends to preserve his nationality or if he may wish to obtain Mexican citizenship, which the third part of article 30

of the constitution of the Republic concedes to him.

ART. 13. The colonists will be considered as having all the rights and obligations which, in each case, the federal constitution concedes or imposes upon Mexicans and foreigners, enjoying the temporary exemptions which the present law grants them; but in all the questions which may arise, of whatever class they may be, they shall be subject to the decisions of the tribunals of the Republic with absolute exclusion

of all foreign intervention.

ART. 14. The colonists who may abandon, without duly justified cause, the lands which may have been ceded to them by sale, for more than one year and before they may have paid for them, shall lose the right to said lands and to the part of the price they may have paid on them.

In the case of Section III of Article 3, abandoning the land or failing to cultivate it for more than six months, without duly justified cause, will cause the right to the

gratuitous title to be lost.

ART. 15. In those places designated by the federal Government for new towns, a lot shall be granted free to the Mexican and foreign colonists who may wish to establish themselves as founders; but they shall not acquire the ownership to said lot, except when they may prove that before the expiration of the first two years they have built a house thereon, losing the right of acquirement in the contrary The allotment shall be made as far as possible by alternate lots.

ART. 16. Mexicans who may reside in foreign countries and who may wish to establish themselves in the deserted parts of the frontiers of the Republic, shall have the right to gratuitous cession of lands, under the conditions of Section III of Article 3, up to 200 hectares of area, and can enjoy for fifteen years the exemptions

which the present law grants.

ART. 17. The Executive is authorized to assist the colonists or immigrants in those cases which he may think convenient and with subjection to the amounts which may be provided in the laws of appropriations, with the expenses of transportation of themselves and their baggage by sea and into the interior, for one time, and to where the railway lines may terminate, with maintenance for fifteen days in those places which he may determine; and with tools, seeds, materials for houses, and animals for breeding and working purposes; such sums advanced being payable by them under the same conditions as the value of the lands.

### CHAPTER III.—Of the companies.

ART. 18. The Executive can authorize companies to colonize public or waste lands with certain conditions of measurement, survey, subdivision in lots, appraisement and description, and for the transportation of colonists and their establishment on such lands.

ART. 19. In order to obtain the proper authority, the companies have to designate the public lands which they wish to colonize, the approximate area, and the number of colonists which they have to establish on them in a fixed time.

ART. 20. The proceedings of the survey or measurement will be authorized by the judge of the district in whose jurisdiction the public land may be located, and at once concluded, and if there be no contesting party it will be delivered to the company, in order that it may present them to the department of fomento, with the other conditions to which Article 18 refers. However, if there should be a contesting party, the corresponding trial will be proceeded with, in which a representative of the treasury department will take part.

ART. 21. As compensation for the expenses which the companies may incur in the survey of the public lands, the Executive can concede to them up to the third part of the lands which they may measure, or of their value; but with the exact conditions that they must not alienate the lands which may be conceded to them to foreigners not authorized to acquire them, nor in greater areas than 2,500 hectares, under the penalty of losing in these two cases the portions which they alienate contrary to these conditions, and which shall pass at once to the ownership of the nation.

ART. 22. The lands surveyed by the companies, and with the exception of those which may be ceded to them as compensation for the expenses of the survey, will be granted to the colonists and be reserved under the terms and conditions which

Articles 3 and 4 of this law establish.

ART. 23. The authorizations which the Executive grants for the survey of public lands shall be without effect and without the right to prorogation, when the respective operations may not have been commenced within the unextendable term of three months

ART. 24. The Executive can make contracts with companies or corporations for the introduction to the Republic and the establishment in it of colonists or foreign immigrants, under the following conditions:

I. The companies must fix the exact time within which they have to introduce a

determined number of colonists.

II. The colonists or immigrants have to fulfill the conditions established in Arti-

cles 5 and 6 of the present law.

III. The bases of the contracts which the companies have to make with the colonists, must be arranged with respect to the provisions of this law and must be submitted to the approbation of the department of fomento.

IV. The companies have to guarantee to the satisfaction of the Executive the fulfillment of the obligations which they may assume in their contracts in those

cases which are subject to forfeiture and fine.

ART. 25. The companies which may contract with the Executive for the transportation to the Republic and the establishment of foreign colonists in it, will enjoy for a term not exceeding twenty years the following franchises and exemptions:

I. Sale upon long time and reduced price of waste or public lands, with the

exclusive object of colonizing them.

II. Exemption of taxes, except those pertaining to the stamp tax, with respect to

the capital invested in the business.

III. Exemption of port dues, except those established for improvements of such ports, with respect to the ships which for account of the companies, may conduct ten families, at the least, of colonists to the Republic.

IV. Exemption of import duties with respect to the tools, machinery, construction materials, and work and breeding animals, used exclusively for an agricultural, mining, or industrial colony, whose formation may have been authorized by the Executive.

V. Bounty for a family established, and another for a family disembarked; a bounty for a Mexican family established in a foreign colony.

VI. Transportation of the colonists, for account of the Government, over the lines

of steamships and subsidized railways.

ART. 26. The foreign colonization companies shall always be considered as Mexicans, and must have their domicile in some of the cities of the Republic, without prejudice to those they can establish in foreign countries, and being obliged to constitute a part of their board of directors in the country, and to have one or more

attorneys in the said Republic, amply empowered to treat with the Executive.

ART. 27. All the questions which may arise between the Government and the companies will be decided by the tribunals of the Republic and in accordance with its

laws, without the intervention of any foreign diplomatic agent.

# CHAPTER IV .- General provisions.

ART. 28. The individuals who may devote a part or the whole of lands of their ownership to the colonization of ten families, at the least, of foreign immigrants, have the right to obtain for the colonies which they may establish on them the same franchises and exemptions which the colonists established by the Government enjoy, always provided that they subject themselves to the conditions which the Executive may fix in order to assure the future of the colony, and always provided that amongst these conditions is to be included the one requiring the colonists to acquire, by purchase or cession, a tract of land for cultivation.

The Executive can furnish foreign colonists to individuals, stipulating with those the conditions under which they have to establish them, and can assist them also by

paying the expenses of transportation of the colonists.

ART. 29. The colonization of the islands of both seas shall be made by the federal Executive subject to the provisions of this law; the Government reserving always, in each island, an area of 50 hectares for public use. In the case that the island may not have a sufficient area to make the separation provided in this article, there will be no sale of lands therein and it can only be rented for a short time.

In the colonies which may be established on the islands, there will always be a number of Mexican families which may not be less than half of the total number of

the colonized families.

ART. 30. The Executive is authorized to acquire, by purchase or cession, the lands of private parties, always provided he may deem it convenient, for the purpose of establishing colonies on them, and subject to the amounts, which may be provided for in the laws of appropriation for public expenses.

ART. 31. All the laws prior to the present with respect to colonization are repealed.

MEXICO, December 15, 1883.

#### REGULATIONS.

ART. 1. In conformity with Section III of Article 7 of the law of the 15th of December, 1883, and Section IV of Article 25 of the same law, the following articles for the

use of recognized colonists and colonization companies are free of duty:

Foodstuffs.—Oil, garlic, dry peas, rice, oats, common and refined sugar, coffee of all classes, salted and smoked meat, hams, barley, onions, beans, fruits and fresh vegetables, ordinary crackers, chick-peas, wheat-flour and that of cereals of all classes, condensed milk, lentils, corn, lard, butter, ground mustard, potatoes, pastries, pep-per, common and table salt, tea of all classes, vinegar in earthen, glass, or wooden receptacles.

Sione and earth.—Clay piping, bricks other than refractory, paving flags and slate tiles of all classes and dimensions worked on one face only, with the exception of those of marble and alabaster, grinding or whet stones, plain glass for windows and

doors, sulphate of lime.

Wagon material.—Wheelbarrows or hand carts of all classes, carts and wagons of

all classes and sizes, iron and steel axles and separate wheels for the same.

Leather goods.—Harness for carts and wagons of all kinds.

Drugs, starch, iron, steel, and other metals.—Woven and barbed wire for fences; hook nails and doorknobs; iron and brass hinges of all classes; iron, steel, or brass keyhole plates without plating or gilding; iron, steel, brass, copper, or bronze locks of all classes; nails, brads, tacks, screws, bolts, and nuts, and rivets of iron or zinc; channel iron and sheet iron for roofs; bellows; iron or brass hook hinges of all classes; tools, and iron, brass, steel, or wooden implements, or composed of these materials, as well as stakes and handles for tools; iron ovens for cooking and stoves with the corresponding iron pipes; iron shoes for animals; windmills of iron or wood, or of both materials, for drawing water from wells; pulleys of iron or wood, or of both materials; iron beams for the construction of houses; corrugated iron or

Miscellaneous articles.—Goldings, brooms, lumber, hair for plastering, doors and windows of wood and of wood and glass, tents, and tent poles.

ART. 2. The colonists, upon their arrival in the Republic, and for one time only, will enjoy exemption from duties on their new furniture or that used if it be ordinated. nary, according to the class of the colonist, as well as on household articles of all classes which they may bring for the purpose of establishing themselves.

ART. 3. The department of fomento shall determine what colonies shall be entitled to the free introduction of provisions, with the limitations and for the time which

it may judge convenient, in accordance with Article 4 of the said law.

ART. 4. The colonists, whose character as such may be recognized, can make the importation of those articles which are free of duty under these regulations or the general laws governing custom-houses, either directly or through the agencies of the

Digitized by GOOGIC

colonization companies, or through commission merchants, but with subjection to

the provisions which are hereinafter expressed.

ART. 5. The colonists, through themselves or through their agents, shall petition the representative of the department of fomento asking the importation of the articles which they may need, whether they may be free under these regulations or under the laws governing custom-houses, accompanying the petition with a list in duplicate, in which they shall detail with clearness the class and quality of the articles which they desire to introduce into the country.

This list shall be passed upon by the representative of the department of fomento, and if he finds that it complies with the law, he shall place the corresponding authorization at the foot thereof, sending at once a copy to the custom-house through which the importation is to be made, preserving another copy in his archives, remitting still another copy to the department of fomento, and delivering to the petitioner a

certificate for his protection.

Where there may not be any representatives, the department of fomento shall invest some federal employee with that character.

ART. 6. The importations which the colonists may make through themselves or through their agents must be included in a consular invoice, without other articles appearing in it which are dutiable, whether or not they may be for the same colonists.

ART. 7. Once the importation is effected, the agent or the colonists shall formulate the petitions for the dispatch of the articles for which the custom-house laws provide. If they agree with the document or documents authorized by the representative of the department of fomento, the delivery of the goods will be made; but if any difference be found to exist, the matter shall proceed in accordance with the provisions of Article 388 of the custom-house laws.

ART. 8. The representatives of the department of fomento shall see that the agents of the colonization companies give them previous notice of the colonists who are to arrive, and the custom-houses through which the goods are to be introduced into the country, in order that they may communicate it to the respective custom-house officials, and upon the arrival of the colonists, there may be no difficulties with respect to the dispatch of the furniture and household effects which they may bring for the purpose of establishing themselves. In said notice, the names of the colonists shall

be clearly stated.

ART. 9. If the representatives of the department of fomento may be in the points where the colonists introduce their effects, they shall be present at the dispatch of the furniture and household goods, with the object of making the respective proof of the exemption of duties which Article 2 concedes; but if they not be there, the corresponding collector of the port shall make such proof. In case it is believed that the articles which the colonists may import are superior in class and quality to that conceded in the said Article 2, the collectors will proceed in accordance with the provisions of Article 180, Section IV, of the custom-house laws.

ART. 10. The representatives of the department of fomento shall see, under the most strict responsibility, that the colonists are not allowed permission to import more goods than those which may be absolutely necessary, taking for this purpose an account of th equantities conceded, and an account of what they may ordinarily need, both with respect to provisions and objects for the construction of houses,

agricultural pursuits, etc.

ART. 11. If it should happen that any of the colonists or their agents abuse the concessions made, for the purpose of selling or trafficking in goods which they may have introduced into the country free of duty, the representative of the department of fomento shall make it known at once to the judge of the respective district, in order that he may proceed with the investigation of the subject; and in case the offense is proven, he will be punished in accordance with Article 371 of the customhouse laws

The collectors of the ports shall also have the same obligations.

ART. 12. The representatives of the department of fomento shall keep a register, in which shall appear the number, in successive order, of the petitions of the colonists, the date of presentation, the date of remission to the custom-house where the introduction is to be made, the name of this, the number of packages contained in the petition, the contents in general, the name or names of the colonists, and the name of the agent, if there should be one.

From the register, an extract shall be remitted monthly to the department of

fomento.

ART. 13. Also, the said representatives shall keep a register in detail of the quantities of goods conceded to each colonist, as well as the number of persons of which his family may be composed, if he has one, making a calculation each six months of the quantities of provisions he has obtained and of the corresponding consumption, and also of other objects for the construction of houses, agricultural pursuits, etc. They shall remit to the department of fomento every six months a copy of the register, with a certified statement of the requirements of the colonists, in order that the said department may make the observations which it may deem just and determine the best means of conducting the matter in the future. Digitized by

### TRANSITORY.

In order to comply with the contract made on the 11th of December, 1885, with Guillermo Andrade, there shall be free of duty, besides the goods of which the previous article treats, and only for the colonists which may be comprehended in said contract, ready-made clothing (including hats and shoes), which they may receive for their use.

MEXICO, July 17, 1889.

### [Circular.]

With the object of avoiding difficulties which may arise with respect to the introduction of breeding and blooded animals, which the colonization companies or the colonists may make in virtue of the exemptions which the law concedes to them, the President of the Republic has seen fit to decide that, in accordance with the provisions of Articles 7 and 25 of the law of the 15th of December, 1883, the colonization companies and the colonists upon importing, in conformity with the respective contracts, breeding, blooded, and work animals which they may bring to the country intended exclusively for the colonies, are subject to the prescriptions of Article 8 of the said law in the following manner, agreed upon between the departments of finance and fomento:

In order that the companies and the colonists may enjoy the exemption of duties, they shall previously petition this department, in each case, for the respective permission to introduce animals, presenting the corresponding invoices which specify the number and class, to the end that this department, in view of the importance of each colony, may authorize the introduction which it may deem prudent.

These invoices shall contain all the data which may be necessary for the indentification of the animals that may be imported before the permit is received from the department of finance. It will be the obligation of the representatives of the department of fomento to exact that permit from the colonization companies and the colonists, before proving and authorizing the dispatch, to which Article 5 of the regulations

of the 17th of July, 1889, refers.

The companies and colonists are strictly prohibited from doing anything in connection with the introduction into the country of breeding, blooded, and work animals which may thwart the objects of the provisions of this circular, notice hereby being given that in all these cases in which this prohibition may have been infringed, the offending parties will suffer the penalty which the general custom-house laws impose upon them.

MEXICO, June 9, 1893.

### LAW ON FOREIGNERS AND THEIR NATURALIZATION.

### CHAPTER I .- Of Mexicans and foreigners.

ART. 1. Shall be considered as Mexicans—

I. Those born within the national territory, whose father is a Mexican citizen, either by birth or by naturalization.

II. Those born within the national territory of a Mexican mother and a father not legally acknowledged according to the laws of the Republic; also those born from

unknown parents or whose nationality may be unknown.

III. Those born without the Republic from a Mexican father that has not forfeited his citizenship. Should the father have forfeited his citizenship, his children shall be held as foreigners; but they will have option to adopt the Mexican nationality within one year from the day on which they will attain 21 years of age, provided they make the requisite declaration before the diplomatic or consular agents of the Republic, if they reside in some foreign country, or before the department for foreign affairs, if they reside within the national territory. Should the sons, to whom reference is made in the foregoing section, reside within the national territory. tory, and, when becoming of legal age, accept any public employment, or serve in the army or the national guard, that circumstance will be sufficient to hold them as Mexican citizens, without further formalities being required.

IV. Those born without the Republic from a Mexican mother, the father being

unknown and the mother not having forfeited her nationality according to the provisions of the present law. Should the mother have become naturalized in a foreign country, her children shall be held as foreigners, but they shall have the right to adopt the Mexican citizenship, provided they comply with the provisions of

Section III.

V. The Mexicans who, having forfeited their citizenship according to the provisions of this law, may recover it by complying with the requirements established by the same, as the case may be.

VI. The foreign woman that marries a Mexican, provided she will retain the Mex-

ican nationality even in her widowhood.

VII. Those born without the Republic, but who, being established within its limits in 1821, swore allegiance to the declaration of independence, have continued to reside

within the national territory, and have not changed their nationality.

VIII. The Mexicans who, living within the territories ceded to the United States by the treaties of February 2, 1848, and November 30, 1853. and having fulfilled the conditions required by said treaties in order to retain their Mexican citizenship. Under similar circumstances shall be considered the Mexicans who continue to reside within the territories actually belonging to Guatemala, and the citizens of the latter Republic living within the territories now belonging to Mexico according to the treaty of September 27, 1882, provided said citizens comply with the provisions of Article 5 of said treaty.

IX. The foreigners that may become naturalized according to the present law.

X. The foreigners that may acquire real estate within the Republic, provided they shall not make a formal declaration of wishing to retain their nationality. At the time of acquiring real estate, and before the execution of the corresponding title deed, the foreigner shall state, before a notary public, or before the local judge, whether it is his intention to become a Mexican citizen according to Section III, Article 30, of the Constitution, or to retain his nationality. Said statement shall be comprised in the deed.

Should he adopt the Mexican citizenship, or should he omit to make any declaration on the subject, he may apply within one year to the department for foreign affairs, in order to fulfill the requirements of Article 2, that he may be held as a

XI. The foreigners that may have children born in Mexico, provided they do not prefer to retain their condition of foreigners, must at the time of registering the birth of a child, state before the judge of the civil register what their intention is on this subject, and the same shall be written down on the act of registration. Should they be willing to adopt the Mexican nationality, or should they omit to make any declaration on the subject, they may apply within one year to the department for foreign affairs in order to fulfill the requirements of Article 2, that tl.y may be considered Mexicans.

XII. The foreigners that may be in the service of the Mexican Government in some official capacity, or that may accept titles or public functions, provided that within one year from the day on which they accepted said titles, or said public functions were co ferred upon them, or on which they have begun to serve the Mexican Government in some official capacity, they apply to the department for foreign affairs in order to fulfill the requirements of Article 2, that they may be considered

as Mexicans.

ART. 2. Shall be considered as foreigners:

I. Those born abroad who are the subjects of foreign governments and have not

become naturalized in Mexico.

II. The children of a foreign father, or of a foreign mother and an unknown father, born within the national territory until they reach the time when, according to the law of nationality of the father or the mother, respectively, they become of legal age. They shall be held as Mexicans unless, within the year following the time of maturity, they declare before the political authority at their place of residence that

it is their wish to continue holding their parents' nationality.

III. Those absent from the Republic without leave or license from the Government, or on account of studies, or of public interests, or for the establishment of commerce or industry, or in the exercise of a profession, and who shall allow ten years to elapse without applying for a license to prolong their absence. These licenses or leaves of absence shall never exceed five years each time they shall be applied for; and after the first has been granted, and in order to obtain a new one, it will be

necessary to allege just causes for such an extension of time.

IV. The Mexican women who shall marry foreigners and who may retain their condition of foreigners even during their widowhood. The marriage once dissolved, the Mexican woman may recover her nationality, provided that, besides establishing her residence within the territory of the Republic, she makes a declaration before the judge of the civil register at the place of her residence that she wishes to recover her Mexican nationality.

The Mexican woman who, according to the laws of her husband's nationality, does not acquire his nationality, shall retain hers.

The change of nationality of the husband posterior to the marriage implies a change of the same nationality in the wife and the minor children, provided they reside in the country where the husband or the father, respectively, has become naturalized with the execution contained in the country when the respective provided in the country when the execution contained in the country when the execution contained in the country when the execution contained in the country when the country were the country when the country when the country were the country when the country were the country when the country were the country when the country when the country were the country when the country were the country when the country were the country when the country were the country when the country were the country when the country were the country when the country were the country when the country when the country were the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country when the country wh uralized, with the exception contained in the preceding paragraph.

V. The Mexicans who shall become naturalized in foreign countries.

VI. Those who, without license or permission from Congress, shall officially serve a foreign government in any political, administrative, judicial, military, or diplomatic capacity.

VI. Those who, without previous license or permission from Congress, shall accept decorations or foreign titles or honors, save those conferred as literary scientific, or

humanitarian distinctions, which may be accepted freely.

ART. 3. In order to determine the place of birth in the different cases pointed out in the foregoing articles, it is hereby declared that Mexican national ships, without any distinction, shall be considered as acional territory. Those born on board shall be held as born within the Republic.

ART. 4. In virtue of the right of foreign residence enjoyed by diplomatic agents, the children of ministers and employees of Mexican legations abroad shall never be

regarded as being born without the Republic of Mexico.

ART. 5. The nationality of alienis juris is regulated by the law which authorizes their status; consequently, all those that may be constituted in the Republic according to its laws shall be Mexican, provided that, besides, they shall have legal domicile within the territory of said Republic.

Foreign alienis juris shall enjoy in Mexico all the rights granted by the laws of the country of their domicile, provided those rights do not conflict with the laws of

# CHAPTER II .- Of expatriation.

ART. 6. The Mexican Republic acknowledges the right of expatriation as natural and inherent in every man, and necessary for the enjoyment of individual liberty. It therefore, just as it permits its inhabitants to exercise said right, leaving them at liberty to quit the country and to settle abroad, also protects the right of foreigners of all nationalities to come and settle within its jurisdiction. The Republic, therefore, will receive the citizens or subjects of other states, and will grant them naturalization papers according to the provisions of the present law.

ART. 7. The expatriation and the consequent naturalization obtained in a foreign country will not impede the extradition of a criminal and his being subjected to trial and punishment, according to treaties and the practice of international laws

and the laws of the country.

ART. 8. Naturalized Mexican citizens, although residing abroad, shall have right to the same protection from the Government of Mexico that Mexican citizens by birth have; and said protection shall be equally effective both in their persons and property. But this provision does not refer to whatever responsibilities they may have incurred in their native country before their naturalization as Mexican citizens; and they shall be liable to said responsibilities whenever they return to their native country, according to the laws of the same.

ART. 9. The Mexican Government shall protect, through the means authorized by the law of nations, all Mexican citizens abroad. The President of the Republic, as

he may deem it proper, shall employ said means as far as they shall not constitute acts of hostility; but in case diplomatic intervention should fail and should such means grow ineffective, or should the cause of complaint constitute such a grave insult to Mexico that it would call for more serious measures, the President shall at once inform Congress, sending all documents relative thereto, for its decision on the

subject.

ART. 10. The naturalization of a foreigner shall be annulled by his residing in his native country during two years, unless that stay be due to the discharge of some official commission from the Mexican Government, or to a special permission from the same.

# CHAPTER III. - Of naturalization.

ART. 11. Any foreigner may become naturalized in Mexico who complies with the

requisites established by the present law.

ART. 12. At least six months before asking for naturalization, the foreigner shall petition the board of aldermen (ayuntamiento) of the place of his residence, stating that it is his wish to become a Mexican citizen, and that he is willing to renounce his foreign nationality. The board of aldermen (ayuntamiento) shall furnish him

with a certified copy of his petition, the original of which is to be duly filed.

ART. 13. After six months have elapsed, and when the foreigner has uninterruptedly resided within the Republic two years, he may ask the federal Government to furnish him with naturalization papers. In order to obtain said papers, he shall have to appear before the district judge of his district, and there promise in writing to furnish proofs of the following facts:

I. That, according to the laws of his own country, he has the full enjoyment of civil rights, being of legal age.

II. That he has resided within the Republic at least two years, and that his behavior has been good.

III. That he has a trade, an industry, a profession, or that he gets an income which enables him to obtain the necessaries of life.

ART. 14. To his petition to the district judge, he shall join the certified copy that was delivered him by the board of aldermen (ayuntamiento), referred to in Article 12; also, a formal renunciation of all allegiance to foreign powers, and especially to the country whose subject he was; and a renunciation of any protection, not coming from the Mexican laws and authorities, and of all rights granted to foreigners by special treaties or by the law of nations.

ART. 15. The district judge, after the petitioner has ratified his petition, shall order the hearing of witnesses—with the intervention of the fiscal prosecutor—on the points specified in Article 13; and, if judged necessary, shall ask the board of aldermen (ayuntamiento) to inform him on said points, and on the one referred to

in Article 12.

The judge shall admit all other proofs that the interested party may furnish on the points specified in Article 13, and shall ask the fiscal prosecutor for a report on

the same.

ART. 16. The judge, should his decision be favorable to the petitioner, shall forward the original papers of the case to the department for foreign affairs, in order that the naturalization papers be issued, provided said department shall see no objection to do so. The interested party shall petition the secretary for foreign affairs (sending his petition through the district judge), asking for the naturalization papers, ratifying his renunciation of his foreign nationality, and formally promising his adhesion, obedience, and submission to the laws and the authorities of the Mexican Republic.

ART. 17. Foreigners in the service of the Mexican national merchant marine may become naturalized upon proof of their having performed such service, one year of service on shipboard in lieu of the two years' residence, as required by Article 13, being enough. For the prosecution of all the necessary legal routine in these cases of naturalization, any district judge residing at any of the ports where the vessel may touch shall be competent. The board of aldermen (ayuntamiento) of any of said ports shall be, likewise, competent to receive the petition referred to in Article 12.

ART. 18. The provisions of Articles 12, 13, 14, 15, and 16 do not hold good as regards foreigners becoming naturalized as per law, and those who have the right to adopt Mexican citizenship. Consequently, the children of a Mexican man or woman who have forfeited their citizenship (to whom reference is made in Sections III and IV of Article 1); the foreign woman who marries a Mexican (see Section IV of the same Article); the sons of a foreign father, or of a foreign mother and an unknown father, born within the national territory (as per Section II, Article 2); and a Mexican woman, the widow of a foreigner (as per Section IV, Article 2), shall be held as naturalized, as regards their legal status, by simply complying with the requirements specified in those provisions and without resorting to new formalities.

ART. 19. Foreigners comprised in Sections X, XI, and XII of article 1 may apply

to the department for foreign affairs for their naturalization papers, within the time specified in said sections. They shall join to their petition the document proving that they have acquired real estate, or that they have had children born to them in Mexico, or that they have accepted some public employment, as the case may be. They shall also inclose the renunciation and promise required by Articles 14 and 16

for a common naturalization.

ART. 20. The absence in a foreign country with the leave of the government shall not interrupt the residence required by Article 13, provided said absence does not exceed six months in two years.

ART. 21. No naturalization papers shall be granted to subjects or citizens of any nation with which the Republic of Mexico may be in a state of war.

ART. 22. Nor shall naturalization papers be granted to persons suspected or convicted in any foreign country of being pirates, slave traders, incendiaries, counterfeiters or forgers of bank notes or other currency, murderers, kidnappers, or robbers. The naturalization obtained by a foreigner through fraud and in violation of the law shall be null and void.

ART. 23. Naturalization papers shall be issued free of all charges, and no fee shall

be collected for the same under any circumstances whatever.

ART. 24. The act of becoming naturalized being of an essentially personal character no powers of attorney shall be admitted for that purpose, unless they are executed ad hoc for said act, and contain the renunciation and promise which the interested party ought to make personally, as per Articles 14 and 16; but in no case whatever shall a power of attorney substitute the actual presence of a foreigner in the territory of the Republic.

ART. 25. The condition of native or of foreigner is untransferable to third persons;

therefore, neither can the native enjoy the rights of the foreigner, nor can the latter profit by the franchises of the former by reason of the one or the other condition.

ART. 26. The change of nationality shall never produce a retroactive effect. The acquisition and the rehabilitation of the rights of Mexican citizenship shall not go into force and produce their effects until the day following that on which every one of the formalities and requirements of the present law for obtaining naturalization have been complied with.

ART. 27. Colonists coming into the country by virtue of contracts executed by the Government, and whose transportation and settling expenses shall be paid by the Government, shall be considered as Mexican citizens. On their contract, agreeing to come to Mexico as colonists, they shall formally declare that it is their resolution to relinquish their primitive nationality and to adopt the Mexican citizenship. When settling in the colony, they shall make, before the proper authority, the renunciation and the promise as required by Articles 13 and 16; and the same shall be forwarded to the department for foreign affairs, when the naturalization papers shall be issued.

ART. 28. Colonists coming into the country by themselves, and for their own account, or being brought by companies or private corporations not subsidized by the Government, and immigrants of all descriptions, may become naturalized, as the case may be, according to the provisions of the present law. The colonists that have settled up to date must abide by the same law, as far as it does not conflict with

their acquired rights as per previous contracts.

ART. 29. The foreigner, naturalized, shall become a citizen of the Republic of Mexico, as soon as he shall comply with the conditions required by Article 34 of the constitution. As regards his legal status, he shall be on just the same footing as born Mexican citizens; and he shall only be disqualified to fill those offices or to exercise those rights that the laws required to be filled or to be exercised only by those born within the territory of the Republic.

# CHAPTER IV.—Of the rights and the obligations of foreigners.

ART. 30. Foreigners, in Mexico, shall enjoy all the civil rights which belong to Mexicans, and all the guaranties granted by Section I, Title I, of the constitution, subject to the power reserved to the Executive of banishing any foreigner whose

residence in the Republic may be considered as pernicious.

ART. 31. For the acquisition of vacant or public lands, of real estate, and of vessels, foreigners shall not be obliged to reside within the territory of the Republic, but they must abide by the restrictions imposed upon them by the laws in force, it being understood that any lease of real estate made to a foreigner for a period of

time exceeding ten years shall be considered as a transfer.

ART. 32. The Federal law, only, shall modify or restrict the civil rights enjoyed by foreigners in obedience to the principle of international reciprocity, that they may be subject, within the Republic, to the same inabilities that the laws of their respective countries impose upon Mexicans residing therein. Consequently, the provisions of the civil and procedure codes of the district on this subject are to be considered as Federal laws and shall be binding throughout the Republic.

ART. 33. Foreigners, without forfeiting their nationality, may reside in the Republic for all lawful purposes. The acquisition, change, or loss of domicile shall

be ruled by the laws of Mexico.

ART. 34. When a declaration suspending individual guaranties shall be made, in the terms allowed by Article 29 of the constitution, foreigners shall remain on the

same footing as Mexicans, subject to the provisions of the law declaring said suspension, with the exception of those stipulations embodied in the treaties.

ART. 38. Foreigners participating in the political troubles of the Republic may be banished from its territory as pernicious. They shall be under the laws of Mexico for any offense or treepass against the same, and their rights and obligations during

a state of war shall be regulated by the law of nations and by the treaties.

ART. 39. The laws which established the matriculation of foreigners are hereby abrogated. It appertains only to the department for foreign affairs to issue naturaliza-tion papers to any foreigner soliciting them. These papers shall constitute the legal presumption of the citizenship of a foreigner, but they will not exclude proof to the contrary. The definite proof of a determined nationality shall be made before the

competent tribunals and by the means established by the laws and treaties.

ART. 40. The present law does not concede to foreigners the rights denied them by the law of nations, by the treaties, or by the laws actually in force in the Mexican

Republic.

# CHAPTER V .- Transitory dispositions.

ART. 1. Foreigners that may have acquired real estate, having children born to them in Mexico, or that have discharged any public office and to whom reference has been made in Sections X, XI, and XII of Article 1 of the present law, shall be

Digitized by GOOGIC

under the obligation of stating in writing, to the political authority of their respective places of residence, within three months from the publication of the present law (unless they have done so previously), whether they wish to obtain the Mexican nationality or to preserve their condition of foreigners. In the first case, they shall have to ask at once for their naturalization papers in the manner provided for in Article 19 of the present law. Should they omit to make the above-mentioned statement, they shall be held as Mexicans, excepting those cases in which an official declaration has been made on this subject.

ART. 2. Colonists settled within the territory of the Republic, to whom reference has been made in the last paragraph of Article 28 of the present law, shall make their written statement in the same terms required by the preceding article, setting forth the nationality under which they wish to be held; and they shall also ask for their naturalization papers, as required by said article, in case they adopt the Mexi-

can nationality

ART. 3. The Executive, on issuing the regulations necessary for carrying into effect the provisions of the present law, shall have especial care in dictating instructions, in order that the local authorities strictly comply with the law.

#### PUBLIC LANDS LAW.

CHAPTER I.—Regarding vacant and national lands, surplus and excess lands and the general regulations for holding and selling same.

ART. 1. The lands dealt with in this law, which are national property, shall, for the purposes required, be divided into the following categories:

I. Vacant lands.

II. Surplus lands.

III. Excess lands. IV. National lands.

ART. 2. Vacant lands are all those in the Republic which have not been put to any public use by the authority duly empowered by law, or ceded by the same authority on an onerous or gratuitous title to any person or corporation having authority to acquire same.

ART. 3. Surplus lands are those held by private persons on primordial title and to a greater extent than specified, such surplus, however, being within the boundaries mentioned in the title and consequently confused with the area for which a title

is held.

ART. 4. Excess lands are those held by private persons during twenty years or more, outside the boundaries indicated in the primordial title they may possess, but adjoining the lands comprised in same title.

ÅRT. 5. National lands are such vacant lands as have been discovered, surveyed, and measured by official commissions or duly authorized companies, and which have

not been legally disposed of.

Such vacant lands will also be considered national lands, as have been denounced by private persons when the latter have abandoned the denouncement, or such denouncement has been declared forfeited or void, provided in all cases that the

survey and measurement of the lands has been made.

ART. 6. Every inhabitant of the Republic, of age and with legal capacity to contract, has the right, in virtue of the terms of this law, to denounce vacant, surplus, and excess lands in every part of the national territory and without restriction as to extent; but natives of nations adjoining the Republic, and such who have been naturalized in such countries, can on no account acquire vacant lands in the States that may adjoin them.

The franchise granted by this article does not cancel the modifications already established by ruling laws, with regard to the acquirement by foreigners of immov-

able property in the Republic.

ART. 7. The obligation hitherto imposed on proprietors and possessors of vacant lands to people, limit, and cultivate them hereby ceases to exist, and the persons who may not have complied with the obligations imposed in this respect by preceding laws, shall be exempted from all penalties without the necessity of making a special declaration in each case, and without the nation at any future period being able to examine, revise, or amend the titles already issued, and much less recover the lands embodied in same, for the mere omission to people, limit, and cultivate them.

ART. 8. The prohibition also ceases to exist which has been imposed on surveying companies of vacant lands by article 21 of the law of December 15, 1883, or by any other legal regulation, to dispose of the lands which have fallen to them in compensation for the surveying expenses, in lots or fractions exceeding 2,500 hectares; and

if any sale should have been made in lots or fractions of a larger quantity, this shall not be considered as a reason for nullification, nor can the nation for this reason at any time recover the lands thus sold.

ART. 9. The vacant lands, with the exception of the instance provided for in the following article, can only be sold after being denounced, and by means of the steps prescribed by this law, and at the prices fixed upon in the special tariff, and which the federal Executive will sanction in conformity with Article 12.

ART. 10. The surplus and excess, as well as vacant lands, held by private persons during twenty years and more without primordial title, but with a legal transfer in fee, issued by private persons or by public authorities not empowered to sell vacant lands, can also be acquired by denouncement or by direct arrangement made with the department of fomento, in accordance with the prescriptions of this law.

ART. 11. The national lands can only be disposed of by the department of fomento at the prices and under the conditions it may decide upon in each case, taking into consideration the quality and locality of the lands and the purposes for which they are to be used. These prices can in no case be less than those given for vacant lands in the tariff in force at the time of the sale, and lands can only be disposed of on a gratuitous title in cases where, for reasons of public utility, reward of services, or other motives, the law expressly authorizes it.

ART. 12. The Executive of the Union, by means of the decree, to be published in the month of January of each year, will fix the tariff of prices of vacant lands in

each state and in the federal district and territories.

This tariff will be in force during the fiscal year immediately subsequent to its

publication.

ART. 13. Two-thirds of the price obtained by the sale of vacant, surplus, or excess lands shall belong to the federal treasury, and one-third to the treasury of the state in which the lands may be situated; but neither the Federation nor the state can refuse to accept payment in legitimate bonds or credits, representing their respective debt, should the acquirer of the land desire to make the payment in such manner.

The price of vacant, surplus, or excess lands situated in the federal district and

territories, as well as the price of national lands, wheresoever they may be situated,

shall belong exclusively to the federal treasury.

ART. 14. The following can not be sold on any title whatever, but will always be under the jurisdiction of the federation:

I. The shores of the sea.

II. The maritime zone, with an extension of 20 meters reckoned from the edge of the water at high tide and along the coast of the continent and the islands.

III. A zone of 10 meters on both banks of navigable rivers and 5 meters on the

banks of smaller rivers

IV. The lands on which monumental ruins may be found, together with such

superficial area as may be deemed necessary for their preservation.

ART. 15. The vacant lands on islands in both oceans can be sold on the same terms as other lands of national property; but on every island, over and above the mari-time zone, an area of at least 50 hectares will be reserved for townships or other public uses; and in case the island is not so extensive, then the entire island will be reserved for such purpose.

The islands in navigable rivers, lakes, and lagoons can not be sold until surveys by experts have been made and information obtained from the head political authority of the respective state, district, or territory, to the effect that there is no impedi-

ment to the sale.

ART. 16. The lagoons, expanses of water, and ponds of national property which are not navigable or likely to become so, as well as the lakes formed by the overflow of the tide, can be sold according to this law, after the surveys by experts have been made and information obtained from the competent marine authorities or from the head political authority of the respective state, district, or territory, proving that no impediment exists to the sale.

ART. 17. The lands referred to in this law, the acquisition of which are solic-

ited for the purpose of establishing salt works, or which may be suitable therefor, can also be sold in accordance with the prescriptions of this law, but the department of fomento can have them specially appraised and fix the sale at higher prices

than those of the ruling tariff, whenever such course should be deemed convenient.

ART. 18. The department of fomento can, in order to exploit the vacant lands and as long as no application for purchase has been made, celebrate contracts for lease, partnership, or other arrangements, whereby the title is not transferred, as well as issue regulations by which the exploiting of woods, rosins, and other products of said lands, indicating the penalties which infringers of such regulations incur, and without prejudice to the prosecution, administratively or judicially, in conformity with the laws, of anyone trespassing on or exploiting vacant lands without permission.

The lessees of such lands can have the right expressed in their contract, to buy the lands at a certain price at any time when a person may solicit the purchase. Such right must, however, be acted upon within a period not exceeding one month, and the denouncer must be compensated for the expenses made in denouncing, measuring, and surveying the land.

ART. 19. The contracts mentioned in the preceding article must always be drawn up on such terms that they do not impede the sale of the vacant lands referred to, and the lands must be delivered to whoever may have denounced and acquired them,

at the latest six months after the corresponding title has been issued.

In like manner, every permit issued in accordance with administrative regulations for the exploiting of vacant lands or their products shall be considered as granted, with the condition of being canceled as soon as the land may be acquired in conformity with this law, without any other right on the part of the holder of the permit, than to claim whatever expenses he may have been put to in proportion to the time his contract may still have to run.

ART. 20. The adjudication of vacant and national, as well as of surplus and excess, lands obtained in conformity with the steps and formalities laid down in this law gives the acquirer possession of the land as against the nation and such private persons who may have given their approval of the adjudication, or who, while opposed to same, may have been judicially defeated. With regard to third parties who may not have received a hearing, the property can only be acquired by prescrip-

tion or other legal title.

ART. 21. The federal Executive shall have the right to temporarily reserve the vacant lands he may deem necessary for the preservation or planting of forests, maintaining or subduing of Indians, or colonization, on such terms as are prescribed by law.

# CHAPTER II.—Regarding the manner of acquiring the lands referred to in this law.

ART. 22. In order to carry out the matter relating to vacant lands, agencies will be established in the states, federal district, and territories, persons nominated by the department of fomento being in charge of such agencies. The number of these agents will vary, the territory within which they are to exercise their functions being clearly defined, and for every agent one or more substitutes will be named. They will not receive any salary from the federal treasury, but will charge their emoluments, in accordance with the tariff issued by the department of fomento, for

ART. 23. The denouncement of vacant lands must be made to the agent of the department of fomento within whose territory the land is situated, and the denouncer must present a written document in duplicate, clearly specifying the location of the

land and the boundaries which separate it from any other property.

ART. 24. On the document being presented, the agent shall register the same in a special book and in the presence of the denouncer, indicating the day and hour of the presentation in the book, as well as on the document and its duplicate, the latter being at once returned to the denouncer for the preservation of his rights.

ART. 25. Within fifteen days following the presentation of the document of denouncement, the agent will investigate whether the land denounced has been sur-

veyed or is reserved for forests, colonization, or subduing of Indians, or for any other reason is in the possession of the public treasury. In case mone of the foregoing cases occur, he will proceed to admit the denouncement and pass it through the course laid down in the regulations of administrative procedure.

ART 26. The agents will not pass the denouncements presented to them regarding lands denounced, for which titles have been given, but in all cases they will register such denouncements, and the decisions they may come to regarding the throwing out of a denouncement will be subject to the revision of the department of fomento

in accordance with the established regulations.

ART. 27. Every denouncement of vacant lands will be published both in the local paper of the town where the agency is situated, as well as in the official periodical of the capital of the state, district, or territory within which such lands may be situated, and for the time and in the form that may be specified by the regulations.

The expenses of such publication shall be paid by the denouncer, as well as the measurement and survey of the lands, which shall in each case be carried out after notifying the adjoining proprietors, by a licensed surveyor, who shall be appointed by the denouncer with the approval of the agent.

ART. 28. Should the vacant land which has been denounced be bounded on all sides by private property, it may preserve its actual figure, whatever that may be. Should it only be bounded in part by lauds of this class, the sides which may be newly laid off shall be rectilinear, and the angles shall be as little acute and as obtuse as may be possible. If it should be entirely surrounded by vacant lands, the figure shall form a square.

When the vacant land denounced is close to private property, the boundaries of the latter shall be adopted for the land denounced, or, should the denouncer prefer

it, a distance of not less than 1 kilometer shall be left between the two.

Digitized by GOOGIC

ART. 29. The plan of the land denounced having been prepared, the surveys made, and the periods having elapsed as determined by the regulations for procedure, and always provided that within such period no opposition should have been presented, the agent will take a copy of the proceedings and of the plans, with the object of forwarding the same to the department of fomento for revision, through the governor of the respective state, who will report on the subject as he may deem most convenient.

ART. 30. The department of fomento having revised the copies of the proceedings and of the plan, and finding that all the requisite steps as demanded by the law and regulations have been complied with, and that the measurements and surveys have been carried out in due form, the said department will adjudicate the land to the denouncer and will notify him to pay the price thereof, in order that a title may be issued to him for the ownership of the same. This notification will be made by the agent before whom the denouncement has been made, always provided that the denouncer does not reside in the capital city, or has not authorized any person therein to represent him.

ART. 31. The price of the vacant land denounced will be that which is determined by the tariff in force at time of the denouncement, and shall be paid within the two months following the decision of the department of fomento, under which the land is adjudicated. Should this period lapse without the presentation, in said department, of the vouchers proving such payment, the denouncer will lose all the rights which he may have acquired, and the lands will be incorporated with the national

lands. If, on the contrary, such vouchers should be presented in due time, the title to the land will be made out and delivered to the denouncer.

ART. 32. If, on the conclusion of the proceeding for denouncement, the department of fomento should consider that the land in question ought to be reserved for public use or for any of the objects authorized under the present law, it will have power to refuse the adjudication of the same to the denouncer and to add it to the national lands; but in such case, the denouncer will be indemnified for the expenses which he may have incurred in the denouncement and measurement of the land and in the course of the proceedings in the department.

ART. 33. The agents will suspend all proceedings as soon as any opposition is presented relating to the land in question, when it is formulated in such a manner that the exact area of the lands can not be determined. Should the opposition clearly refer to only one specific part of the land, the administrative proceedings will continue so far as relates to the land not included in the opposition, always provided that the denouncer so petitions; and with respect to that which is affected by the opposition, the proceedings will be carried before the district court of the state,

district, or territory in which the lands are situated.

ART. 34. The opposition suit will be investigated with intervention of the Government attorney as representative of the public treasury, and in accordance with the rules of procedure provided by the laws in federal questions, for summary decisions,

the decision of the court of second instance allowing no appeal.

ART. 35. The final decision which may be pronounced with respect to an opposition will always contain a specific declaration with respect to costs, and a copy thereof will be forwarded to the land agent in order that he may add it to the administrative proceedings. Should the decision be entirely adverse to the denouncer, the denouncement will be considered as not made in so far as it attacks the rights of the opposer; and, lastly, if it should be entirely adverse to the latter, the denouncement will be allowed to run its course as if no opposition had been presented.

ART. 36. The department of fomento will have power to refuse the adjudication of vacant lands when these are denounced along the river banks or water courses, and when through such denouncement these should be rendered useless by depriving the adjoining proprietors of access to the river or water course, because as far as possible, all lots which may be formed out of vacant lands crossing a stream shall

have free access to the same.

ART. 37. The agents can only suspend denouncement proceedings by reason of opposition; but for no other reason and in no other case will they be allowed to suspend such proceedings or to extend the periods specified, and once these are concluded they shall take a copy of the proceedings in their order of presentation, and shall forward the same to the department of fomento, so that it may declare the abandonment by the tardy denouncer, making the agent responsible for the same. Once the denouncement shall have been declared lapsed, he will not be allowed to denounce the same vacant land within one year of his first denouncement having been so declared.

ART. 38. The excess and surplus lands of a property, as well as the lands referred to by Article 10 of the present law, may be acquired by denouncement after fulfilling the provisions of the previous article, or by direct application to the department of fomento, which has authority to make arrangements in everything that refers to the

national interests, either declaring that no vacant, excess, or surplus lands exist within the boundaries of a property, or else determining that such vacant, excess, or surplus lands, if found, should be adjudicated to the owner of said property.

ART. 39. The following requisites will be indispensable for the execution of the

settlements referred to in the previous article:

I. That the maps should be prepared and presented by a licensed surveyor, to the satisfaction of the department of fomento, being drawn to the scale, and with all the other requisites and details that are stipulated in the administrative regulations.

II. That the deed shall set forth in an authentic and positive manner the consent of all and each of the adjoining owners to the boundaries which the plan shows for the lands on which the settlement is to be made, or that if any difference should have arisen with respect to such boundaries, it has been decided by a final sentence and is classed as a settled question.

The law will consider as a sufficient proof of the consent of the adjoining proprie-

tors any one of the following conditions:

(a) A public instrument executed before a notary or judge authorized to execute public instruments.

(b) Appearance before a judge of first instance.

(c) Appearance before the land agent of the district in which the property is situated.

III. That the original titles should be presented in legal form, or, if required, the subsequent transfers.

IV. That the last deed or transfer should also be presented in legal form, after having been duly recorded in the property registry of the district or canton in which the lands in question are situated.

V. That the original or certified copy of the report rendered before the district court should be presented, proving the occupation of the land or of the excess or

surplus lands during the period required under this law.

ART. 40. Once the requisites demanded by the previous article are complied with, the department of fomento will be empowered to declare that no vacant lands exist within the limits of a certain property, or adjudicate such vacant, excess, or surplus lands that may be therein found to the possessor of the same, on payment of the price specified by the tariff which is in force at the time when such lands were petitioned for, and with the rebates which this law grants to persons in possession

ART. 41. The national lands will be sold by the department of fomento, for cash or on time, and at prices agreed upon, always provided that they shall in no case be lower than those which are specified in the tariff in force at the time of making the sale. After receiving the reports which it may deem necessary, the department of fomento will be empowered to grant or deny the sale, and even to grant time for the payment of the price; but in this latter case, no title will be issued to the purchaser until he has concluded the payment of the price, agreed upon.

until he has concluded the payment of the price agreed upon.

When the lands are sold for purposes of colonization, the respective contracts will be executed in accordance with the provisions of the special laws on the subject.

CHAPTER III.—Of the privileges conceded to the occupiers of racant, excess, or surplus lands.

ART. 42. The possessors of excess lands will be entitled to a rebate of 66 per cent on the tariff price. Those who are in possession of surplus and vacant lands, under a deed of transfer, and occupation for more than twenty years, will be entitled to a rebate of 50 per cent on the above-mentioned tariff price, while the rebate will only be 33 per cent for the occupiers of vacant lands, under a deed of transfer, with possession for more than ten years and less than twenty.

ART. 43. For the term of one year from the date on which this law comes into force, only the occupiers of vacant, excess, or surplus lands, to whom the previous article refers, will be allowed to petition for the possession of the same, after which time such lands will be liable to denouncement by any other person, though such denouncer

will have no right to a rebate in the price.

After the lapse of the year above mentioned, even in the case of the land being denounced by a third party, the occupier will have the right of preference in the adjudication of the land in question, always provided that he avail himself of such right before the statement is forwarded by the respective agency to the department of fomento, and on condition of his paying expenses incurred in the denouncement.

of fomento, and on condition of his paying expenses incurred in the denouncement.

ART. 44. From the date on which this law takes effect, all laws or resolutions which prohibit the preemption of vacant lands are revoked. Any person will, therefore, be empowered, unless he is excepted by law, to preempt an area not exceeding 5,000 hectares of vacant lands, and no more, always provided that he fulfills the conditions with respect to the time of occupation and the nature of the title which protect him, as established by the civil code of the federal district.

### CHAPTER IV.—Of the grand registry of property in the Republic.

ART. 45. The grand registry of property in the Republic is hereby established as a dependent office of the department of fomento, and in this office will be recorded with all the requisites and formalities provided by this law and its regulations, the original titles to vacant or national lands and those which may be issued by virtue of settlements already made or that may hereafter be made by the department of

ART. 46. The grand registry of property in the Republic will be a public office, and all public or private persons who may so demand it will be allowed to examine and ask for certified or plain copies of the record and plans which are there kept.

ART. 47. The recording of titles in the grand registry of property in the Republic will be entirely voluntary on the part of the owners and occupiers of lands, and for that very reason, the omission of such record will not deprive them of any of the rights which pertain to them in accordance with the laws in force, but they will not enjoy the privileges which are conceded to holders of registered properties.

ART. 48. All titles to properties which are recorded in the grand registry of property in the Republic will be considered by the federal Government as perfect, irrevocable, and exempt from every class of revision. Consequently, with respect to the government and authorities of the nation, the effect of the record will be such that none of these, whatever may be their rank, nor any of their agents whatever, will at any time be allowed to demand the presentation of the original titles or documents, and still less subject them to an inspection or revision of any class whatever, as the simple certificate of registry will serve the purpose of a perfect and irrevocable title, and under no pretext will any rectification of the area of the registered property be allowed.

ART. 49. With respect to the denouncements of land which are included within the limits of a property recorded in the grand registry of property of the Republic, whether the denouncement is made on the plea that such lands are vacant, excess, or surplus lands, the registry will serve the purpose of declaring the denouncement at once to be entirely inadmissible, and it shall be so declared as soon as the certificate of registry is presented, but without prejudice to the revision of such declaration

by the department of fomento, as provided in Article 26.

ART. 50. With respect to the adjoining proprietors of an estate of land which is recorded in the grand registry of property in the Republic, such registry will have the same effect as that which the laws attribute to a valid and perfect title, as long as a judicial decision is not pronounced and ordered to be executed, declaring the record void or subject to modification in that part which concerns the opposing neighbor.

ART. 51. The following persons will not be allowed to petition for the voiding of a record:

I. Any person who may have consented to the boundaries specified for the property and set down in the plan which has served for the registry, whether such consent has been given personally or by any one of the predecessors or owners prior to the person making such opposition.

II. Any person who, having opposed the determination of a specific boundary before the registry of the property, has lost the case in a court of law under a specific

sentence.

ART. 52. The effects attributed to the registry of property in the preceding articles will not free the possessors of land from the obligation of allowing the limits or boundaries of the same to be identified by the Government, by its agents, or by pri-vate persons who may have an interest therein, in all those cases in which such identification is carried out in accordance with law.

ART. 53. No registry of land or property will be verified, except by a special resolution of the department of fomento, which resolution will be preserved with the plan of the estate or land in question.

ART. 54. Every registry will include:

. The name of the person who petitions for it.

II. The name under which the estate, property, or land which it is desired to register is known, or that which has been given to it by the proprietor.

III. The situation of the estate, property, or land with relation to the political division of the national territory, setting forth at least the State, district, canton, or municipality.

IV. The boundaries of the estate, property, or land in the whole of its perimeter, specifying as far as possible the fixed points which can be easily identified, or arti-

ficial monuments of a solid and permanent construction.

V. Date and extracts of all the original titles which serve as a basis for the registry

VI. Date and extract of the last conveyance executed in favor of the person petitioning for registry.

VII. All the other data and circumstances that may be demanded by the administrative regulations.

ART. 55. The department of fomento will not grant the registry of a property until the following requisites have been fulfilled with respect to the same:

I. A declaration extended by the same department that every interest of the nation is satisfied, with respect to the sale of the property or land in question.

II. Presentation of the last conveyance in favor of the person soliciting the registry, duly inscribed in the public registry of the district or county in which the property may be situated.

III. Presentation of the plan of the land or property with all the requisites that

are demanded by Section I, Article 39.

IV. Proof of the consent of each and all the adjoining proprietors, with the boundaries specified for the land in the plan in the form as set forth in Section II of the above-mentioned Article 39, or proof that the adjoining proprietor who disputes the boundary has been duly defeated before the courts.

ART. 56. Each inscription will have reference to one sole estate or property, and consequently no inscription will be allowed to include any lands whatever which are not united and constitute one sole property, although they may belong to one

owner.

ART. 57. In order that the certificate of inscription in the grand registry of property in the Republic should have the legal force attributed to it by this law, it shall not be necessary that it should be issued in the name of the person who exhibits the same, but the proprietors of lands will have the right to petition that the name of the person in whose favor an inscription has been made should be changed, presenting at the same time to the grand registry of the property of the Republic a public instrument showing that they are the legitimate successors to the private or general title of the person in whose favor the inscription is made, always provided that such document be duly inscribed in the public registry of property in the district or county in which such lands may be situated.

ART. 58. In case any land or property already registered should in any way be subdivided, the corresponding note is to be made on the original inscription, and a new registry made with respect to every fraction or subdivision that may have been transferred to another owner, always provided that at the opening of the new registry, the interested party shall not omit to present and record the plan of the subdi vision in question, and that the proper annotations shall be made on the original plan

of the divided property.

ART. 59. Outside of the cases of transfer, division, or subdivision of a registered property, as referred to in the two preceding articles, an inscription may only be altered, modified, or canceled in accordance with a final sentence which has been classed as the termination of a question and has been pronounced by a competent Tederal judge or tribunal with respect to the situation of the land treated of, and declaring that the inscription was void or that it must be altered or modified. The only legal reason for declaring the nullity or modification of an inscription shall be the proof of its having been granted under error or fraud, or that the previous requisites established by law have not been fulfilled. The Government attorney will always be heard in these suits and be considered as a party to the same.

ART. 60. The department of fomento will notify the land agents of the properties

which may have been inscribed in the grand registry of property in the Republic, and which may be situated within the limits of their jurisdiction, in order that under no pretext will they admit a denouncement of the same or of any part of the lands

which they include.

ART. 61. A tax will be levied on every inscription in the grand registry of property in the Republic, and this tax will be paid in stamps, which will be affixed to the book in which each inscription is made and in accordance with the following tariff:

For the properties that measure less than 10,000 hectares a tax will be paid at the rate of 1 cent per hectare, always provided that in no case shall the tax amount to less than \$2.

The properties which measure more than 10,000 and less than 50,000 hectares will pay the above-mentioned tax of 1 cent per hectare on the first 10,000 and half a cent per hectare on all the excess above that area.

On those properties which may measure more than 50,000 hectares, the tax will be paid as above specified, and one-quarter of a cent for each hectare that may exceed

These taxes will be paid on one sole occasion, but dues will be collected according to the tariff, which will be approved by the department of fomento, on all certified copies which may be issued of an inscription or of the annotations to the same, in case of a change of proprietors or division of the land, and such taxes will also be paid in revenue stamps.

ART. 62. The chief of the bureau of the grand registry of property in the Republic will execute a bond for not less than \$10,000 to answer for the losses which the public treasury or private individuals may suffer through fraud or omission in the

Digitized by GOOGIC

inscriptions that he may make; but he will have the right to make any observations with respect to the resolutions ordering such inscriptions, and his responsibility will only cease when, in spite of such observations, the order should be repeated.

# CHAPTER V .- General provisions.

ART. 63. The titles issued by competent authority, in accordance with the laws, and especially those which the department of fomento may have executed since the coming into force of the law of the 20th of July, 1863, are declared exempt from every class of revision, such titles expressly confirming and ratifying all that refers to the interest of the public treasury, and they shall not in future be nullified or modified, except on account of error or fraud, duly declared by the competent tribunals of the federation, in a judgment which has the authority of a settled question. Nevertheless, the above mentioned titles will only protect the lands included within the area to which they refer, and within the boundaries therein specified, and can not be extended to any greater area or to any other boundaries.

ART. 64. The transfers of vacant and national lands made by the department of fomento by way of compensation, are also hereby ratified and confirmed under the aforementioned conditions and so far as concerns the interest of the public treasury, as well as the declarations made by the same department certifying that certain properties do not contain vacant, excess, or surplus lands; and such transfers and declarations can only be declared null and void through a final decision, pronounced by the competent tribunals of the federation, declaring that they have been obtained by

error or fraud.

ART. 65. Every original title to vacant lands which may have been issued by competent authority and in compliance with all the requisites in force at the time of such issue, is perfectly legal and valid, and therefore requires no revision, ratification, or confirmation of any class whatsoever, always provided that such title should agree with the area and specified boundaries of the land, or that any errors therein should have been rectified by an arrangement carried out with the competent authority.

The above provision does not modify the others of the present law in reference to properties which are inscribed in the grand registry of property in the Republic, the possessors of which will only be obliged to permit the verification of the bound-

aries, in accordance with the provisions of Article 52.

ART. 66. The engineers who may make the surveys of vacant, national, excess, or surplus lands will be responsible under the civil code to the public treasury for the loss and damage which they may cause to the same by their negligence or ignorance in the execution of their work, and without prejudice to the penalties which they may incur in case of error or fraud, in accordance with the penal laws

on the subject.

ART. 67. The prohibition and legal incapacity now attached to communities and civil corporations for the possession of real estate will continue to subsist; and the governments of the states, with the help of the federal authorities, will continue to survey and subdivide the lands forming town commons or town sites amongst the residents of their respective towns, always provided that such operation has not already been carried out; and they will subject themselves to the boundaries stipulated in the concessions granted to the towns, either by the Spanish Government during the colonial period, or by the state governments during the period when they disposed of the vacant lands. In case the concession should not specify either the area or the boundaries of said lands, a square league will be assigned to each town, in accordance with the old provisions, always provided that there should be enough vacant lands to make that reserve without invading private property or, on the other hand, taking a larger area from the vacant lands than that expressed by

ART. 68. If any township should possess excess or surplus lands under the title of common, it can be allowed to enter into an arrangement on the same condition as a

private person.

ART. 69. In order to petition for the arrangements mentioned in the preceding article, as well as to defend the town commons, lands, and forests, from a legal denouncement, and also to subdivide the same between the individuals who have a right thereto, judicial personality is conferred on the town councils or municipal corporations of the Republic, whatever may be their denomination under the local

ART. 70. The department of fomento will issue the regulations for the utilization of the forests and vacant lands which may be temporarily reserved in accordance with the authority conceded to the federal Executive under article 21 of the present

ART. 71. Every contract celebrated and every resolution promulgated with respect to vacant, excess, surplus, or national lands, by functionaries who are not for that purpose empowered by law, will be considered as contrary to law and as not constituting any responsibility whatever on the part of the public treasury.

ART. 72. No person will be allowed to oppose surveys, or the execution of any act by order of a competent authority, that may be necessary to verify the truth or legality of the denouncement; but whenever the judgment pronounced in the case declares that the land denounced is not vacant, either wholly or in part, the owner will have a right to compensation for the loss and damage caused by the denouncement, without prejudice to the criminal action that may be taken in accordance

The above provision does not in any way modify those contained in articles 48 and 49.

ART. 73. The simple fact of having denounced land as vacant does not grant any right to take possession of the same, until the title is legally granted in the form and with the requisites that are established under this law.

### TEMPORARY PROVISIONS.

ART. 74. The proceedings with respect to the denouncement of vacant land which may be pending at the time this law comes into force will continue to be followed before the district judges who have taken cognizance thereof, and will be prosecuted and decided in conformity with the laws which were in force when such proceedings were commenced, without prejudice to the rights of the denouncers to retire their denouncements, in order to present them afresh before the corresponding land agency in case no opposition has been presented; but should such opposition have been made, the proceedings will be carried on in accordance with the law.

ART. 75. The district judges and circuit tribunals, before whom may be pending any matters referred to by the preceding article, will remit to the department of fomento, within the month following the date on which this law comes into force, a return of the papers which may exist in their offices with respect to vacant lands, setting forth the name of the denouncer, the land denounced, the name of the person opposing (in case there be any), the last step taken, and the date on which this

took place.

ART. 76. The district courts and circuit tribunals, which may have taken cognizance of questions referring to vacant lands, will proceed ex officio to carry out the provisions of Article 21 of the law of the 22d of July, 1863, and of the circulars on the subject of the 27th of July, 1868, and the 26th of October, 1884, declaring as abandoned the denouncements in which no steps have been taken without showing a legal motive for such suspension, and ordering the respective papers to be passed into the archives.

ART. 77. The proceeding with respect to denouncements of vacant lands which may be pending before the department of fomento at the time when this law comes into force, will be decided in accordance with the laws in force at the time when such proceedings were commenced; but the compensations, declarations, and arrangements which may not be definitely decided at that date, will be made subject to the rules established by this law.

ART. 78. The staff and salaries for the office of the grand registry of property in

the Republic will be as follows:

One director	\$3,000
One first officer	2,000
One second officer	1 800
Two clerks, at \$600	1. 200
Two clerks, at \$600	1, 200

ART. 79. This law takes effect throughout the Republic on the 1st of July of the present year; and the law of the 20th of July, 1863, as well as all others that may be in force with respect to vacant lands are rescinded from that date.

MEXICO. March 26, 1894.

### MEXICAN PATENT LAW.

Consul-General Barlow also sends the following:

Inasmuch as almost innumerable inquiries are coming in as to the Mexican law of patents, it is thought that the publication of a translation of such law, together with explanations as to the mode of obtaining patents, may be found useful. The Mexican patent law was promulgated on the 7th day of June, 1890, and amended, only so far as its Article 33 is concerned, on June 2, 1896. That article, in the original law, required that proof should be given within five years from the date of the patent that the objects or processes protected thereby were manufactured or employed within the Republic; otherwise the patent would become null and void. The amending law, as will hereafter be seen, provided for certain extra fees to be paid every five years, in lieu of manufacturing, etc.

With the exception of certain merely "transitory" articles or clauses, the following is a translation of the entire Mexican law as to patents:

ART. 1. Any Mexican or foreigner who is the inventor or improver of any industry or art, or of objects destined therefor, has the right, by virtue of article 28 of the constitution, to the exclusive use thereof during a certain number of years, under the rules and regulations prescribed in this law.

In order to acquire this right, a patent of invention or improvement must be

obtained.

ART. 2. Every discovery, invention, or improvement that may have 10r its object a new industrial product, a new manner of production, or the new application of means already known for the attainment of a result or of an industrial product, are susceptible of being patented. Chemical or pharmaceutical products are likewise sus-

ceptible of being patented.

ART. 3. An invention or improvement shall not be considered new when, in this country or abroad, and prior to the petition for the patent, it may have received publicity. The case, however, is excepted when the publicity may have been made by a foreign authority empowered to issue patents, and when the invention or improvement may have been presented in expositions held within the territory of the Republic or abroad.

ART. 4. The following can not be patented:

The inventions or improvements whose working shall be contrary to the laws

forbidding them or regarding public security.

II. Scientific principles or discoveries, when they are merely speculative or are not put into practice by means of a machine, apparatus, instruments, mechanical or

chemical proceedings of a practical industrial character.

ART. 5. The concession of a patent does not guarantee the novelty or the usefulness of the object to which it relates, nor does it solve questions that may arise therefrom. Consequently, it must be granted without previous examination as to the novelty or utility of the invention or improvement, or of the sufficiency or insufficiency of the descriptions that may accompany the petition.

ART. 6. The concession of a patent can only be made with reference to one object or industrial process. When two or more can be combined among themselves to produce the same industrial result, there must be asked the number of patents that

may be necessary therefor.

ART. 7. The rights granted by virtue of the patents issued in the Republic for objects or processes that may have been or may hereafter be protected by foreign patents, are independent of the rights that the same may grant, and of the effects or results that they may produce.

ART. 8. The effects of a patent are:

I. To deprive every person, without permission from the owner of the patent, of the right to produce, through industrial means, the object of the invention, or to

place it in the market, or to sell it.

II. With reference to a process, machine, or any other manner of working an instrument, the effect of the patent is to deprive others of the right to apply the process or to use the object of the invention, without the permission of the owner of the patent.

ART. 9. The patent does not produce any effect whatever as regards a third party who was already secretly working or had made the preparations necessary for working within the Republic the invention or process, before the presentation of the

patent.

ART. 10. The scope of the patent does not comprise the objects or products that may cross in transit the territory of the Republic or may remain within its territo-

ART. 11. The right of petitioning for a patent for objects or processes that may be protected by foreign patents can only be granted to inventors or improvers, or to their legitimate representatives.

ART. 12. Inventors shall have the period of one year from the date of the patent, within which they shall have the exclusive right to petition for patents for

ÅRT. 13. Patents may be granted for twenty years from the date when the same shall have been issued; nevertheless, when the patents shall be asked for objects or processes already protected by foreign patents, the terms of their duration can not exceed what may be wanting for the expiration of the first patents issued in favor of the petitioners.

ART. 14. The term of a patent may be extended for five years at the discretion of the Executive. The extension of the term of a patent of invention involves the extension of the term of the supplementary patents of improvement relative thereto.

ART. 15. On payment of a fair indemnification, the Executive may appropriate a patent on the ground of public policy or on account of the patented article being of such a nature that its free use is capable of proving an important source of public wealth. However, this can only be done under one of the following circumstances:

I. When the patentee refuses to allow his patent to be worked.

II. When the machine, apparatus, instrument, or process is capable of being produced or used in the country.

The regulations will determine the formalities and procedure to be observed in

the appropriation of patents for the public good.

ART. 16. In order to obtain the protection of this law, application must be made in due form to the department of encouragement (fomento), to which the power to grant patents belongs.

ART. 17. The first applicant for a patent shall have in his favor the presumption

of being the first inventor, and, moreover, enjoys the right of possession.

ART. 18 Inventors, whether citizens or foreigners, who are unable to apply personally to the department of encouragement, may appoint attorneys in fact to act for them, both in obtaining the patent and in lawsuits and other matters relative thereto.

Citizens may appoint an attorney in fact by a common letter of authorization, but

foreigners must grant a regular power of attorney duly protocolized.

The effects of the power of attorney cease with the issue of the patent, unless it

be otherwise stated in the power.

ART. 19. The petition for the granting of letters patent shall be published in the official journal of the federal Government during a period of two months, at intervals of ten days.

ART. 20. During the period of time mentioned in the foregoing article, opposition proceedings may be instituted by anyone with a view to prevent the granting of the patent solicited.

After the said period of time has elapsed, no proceedings by way of opposition

will be allowed.

ART. 21. Opposition proceedings can only be instituted on either of the following grounds:

I. That the alleged invention or improvement is not properly patentable under

the provisions of this law.

II. That such alleged invention or improvement has been taken from descriptions, drawings, models, devices, apparatuses, or methods invented by another, or from processes already reduced to practice by another, or, in general, on the ground that the applicant is not the original inventor or his legitimate representative.

ART. 22. If two or more persons claim the same invention, the first inventor or improver of the object or process in respect of which it is sought shall be entitled to the patent, but if the priority of invention can not be determined, the patent shall

be granted to the first petitioner.

ART. 23. If opposition proceedings be instituted, as determined by Articles 20 and 21, the department of encouragement shall summon the parties and endeavor to reconcile their conflicting claims. But if this is not obtained, the department shall suspend all further executive proceedings and shall transmit all the evidence in the case to the proper judicial authority. The party instituting opposition proceedings shall be allowed two months to make good his action in court, but if he fail to do so within this time, his claim shall be disallowed.

ART. 24. All final decisions come to by the judicial authority shall be transmitted

to the department of encouragement, that they may be duly enforced.

ART 25. The decrees of the department of encouragement granting a patent can only be canceled by a judicial decision, and only owing to the nullity of the patent. ART. 26. At the expiration of the two months referred to in article 19, and after

the Government tax has been paid into the treasury of the nation, the letters patent shall be issued with reference to the invention or improvement sought, provided always that letters patent covering the same invention have not previously been granted by the department of encouragement.

ART. 27. Letters patent shall be issued in the name of the nation, shall have subscribed thereto the signature of the President of the Republic, be countersigned by the secretary of encouragement, and bear, besides, the great seal; furthermore, they must contain in clear language a description of the discovery or improvement

patented.

The letters patent, with one of the copies of the drawings, samples, models and other matters under seal, together with the documents presented with the petition, duly certified by the subsecretary, shall constitute the title of property of the person who may obtain the patent.

ART. 28. Letters patent shall be recorded in a special register, wherein the appro-

priate entries relative thereto shall be made.

ART. 29. All letters patent that may be issued shall be published in the official journal; and, furthermore, every year a special book shall be published which must contain a clear and exact description of the inventions or improvements, as also copies of the drawings.

ART. 30. All products protected by letters patent shall bear a mark stating that

fact and the number and date of the letters patent.

ART. 31. Letters patent shall require the payment of a fee amounting to from fifty to one hundred and fifty dollars, payable in Mexican dollars or in bonds of the national consolidated debt.

ART. 32. In case of the extension referred to in article 14, a new fee shall be paid

in conformity with the foregoing article.

ART. 33. The owner of letters patent for an invention or improvement must prove before the department of encouragement at the end of each five years of the duration of the patent, so as to preserve it for another five years, that he has made payment into the general treasury of the federation of fifty dollars as an additional fee at the end of the first five years; seventy-five dollars at the end of ten years, and one hundred dollars at the end of fifteen years. All these payments must be made in Mexican dollars. The time within which these payments have to be proved shall be two months after the term of five years, which time can not be extended.

ART. 34. The department of encouragement shall make an entry in the registry of letters patent, of the fact that the requirement referred to in the foregoing articles

has been complied with.

ART. 35. Letters patent are null and void:

I. Whenever they may have been issued in contravention of what is prescribed in Articles 2, 3, and 4. Nevertheless, when letters patent shall have been obtained in conformity with a petition wherein the petitioner has presented and obtained more than what he is entitled to as the first discoverer or inventor, his patent shall be valid in so far as it relates to whatever he may be entitled to, provided it does not infringe the provisions of the following subdivision and that no fraud shall have been committed upon making the petition. In this case, the patent shall be limited to what it should only comprise, the proceedings relating thereto being in conformity with what is prescribed in Article 39

II. Whenever the object for which the patent has been asked is different from that

which is obtained by virtue of the letters patent.

III. Whenever it is proved that the main object sought in the petition for the letters patent is comprised within one of the cases referred to in Subdivision II of Article 21.

The proceedings to invalidate letters patent have to be commenced within the term of one year after the date when the patent shall be put in operation in the Republic.

ART. 36. An action for the purpose of declaring letters patent invalid before the courts may be instituted at the instance of a party, or by the attorney-general

Whoever may work or have in operation the same industry shall have the right to interpose an exception and take part in the proceedings of opposition.

ART. 37. Letters patent shall lapse-

Whenever the term for which they were granted shall have terminated and may not have been extended.

II. When they shall be given up in part or in their entirety

III. Whenever compliance shall not have been made with the provisions of Article 33.

ART. 38. The department of encouragement shall declare the invalidity of the patent in the two first cases referred to in the foregoing article; in the third case, this can only be done by the court at the instance and request of the attorneygeneral, or of an interested party, by instituting an action or excepting.

ART. 39. The declarations of nullity and lapse of letters patent shall be published

in the official journal of the Federal Government and entered in the register of inscriptions of the department of encouragement.

ART. 40. The determinations of nullity and lapse of letters patent produce the

effect of subjecting the inventions or improvements to public use.

In case of giving up letters patent, if only a portion of the same is given up, the public has merely the right to use the portion thus abandoned, the letters patent remaining valid as to the rest thereof. The abandonment shall be made by writing and be entered in the register.

ART. 41. The ownership of letters patent may be assigned by any of the means established by law with regard to private property, but no act of assignment or any other that implies the modification of the right of property, shall be prejudicial to the rights of third parties, if the same shall not be recorded in the office of the department of encouragement.

ART. 42. Everything relating to the crime of forgery of letters patent shall be subject to the provisions of the Penal Code of the federal district, and to those established by the codes of procedure.

The consul-general adds:

The foregoing provisions would seem to be sufficiently clear, and it only remains to give a few hints as to the methods which should be employed by a nonresident foreigner in order to obtain a patent. In the first place, he must appoint an attorney in fact, who resides in Mexico City or is prepared to come to the city in order to apply for the patent. Care should be taken to give the full name, address, and occupation of both the inventor and the attorney. The power of attorney must be executed in the presence of and be attested by a notary public. Afterwards, the chief clerk of the court, or some other official having this duty cast upon him, must certify to the fact that the notary is such and as to the genuineness of the latter's signature. Then, the document is taken or forwarded to the Mexican consul, so that he may "legalize," as it is called, the signature of the chief clerk, or other official alluded to. Without this legalization, the power is worthless here.

When the power of attorney arrives in Mexico City, it is taken to the department

of foreign affairs for the purpose of having the Mexican consul's signature legalized in turn. Then, an application has to be made to one of the courts here to have the power protocolized by a notary. It is unnecessary to detail the various steps whereby the protocolization is effected, but it should be stated that the entire process costs from thirty to forty dollars, Mexican, including the translation of the

document into Spanish.

It is hardly necessary to state that the description of the invention as well as the petition for letters patent, etc., must all be conched in Spanish. The nonresident foreigner should send his attorney a complete description of his invention—such a description as would be sufficient in the United States or in England—and, in proper cases, accompany same by the usual drawings in duplicate. All measurements, etc., cases, accompany same by the usual drawings in duplicate. An measurements, etc., should be put in accordance with the metric system, the use of which has recently been made compulsory in Mexico. With reference to the drawings, which need not be of any particular size, care should be taken not to insert any English words on same. If it is desired that any words should be used in connection with any figure, such words may be written in pencil on one of the copies, in such a manner that they can be easily erased and the Spanish equivalents substituted in ink.

Much trouble and delay will be saved by careful attention to the hints above given.

As stated in Article 5 of the law, no examination is made as to the novelty or utility of the invention, or the sufficiency or insufficiency of the description. The

responsibility as to these points is thus thrown on the applicant.

It is only in the case of a patent covering the same invention having already been issued, that the department can refuse to issue a patent properly applied for and

unopposed (see Article 26.)

Article 15 would seem to contemplate the issue of regulations supplementary to the law. As a matter of fact, however, there have been no such regulations framed, as yet, and none would appear to be necessary, inasmuch as the law itself is full, clear, and explicit.

# CHIHUAHUA.

### GENERAL DESCRIPTION.

Chihuahua has 24,000 inhabitants. Of the 600 foreigners in the city, more than half are Americans. The Americans handle about one half

the business done by foreigners in the district.

The city is situated on the Mexican Central Railroad, 226 miles south of El Paso, Tex. This railroad traverses Mexico north and south from El Paso to the city of Mexico, 1,224 miles. The altitude of Chihuahua is 6,400 feet, and the climate is equable and healthful, without extremes of heat or cold. The city is lighted by electricity, and is provided with horse-car lines and sewerage. The principal public buildings are the Catholic Cathedral, the State capitol ("Palacia"), and the "Hospital Porfirio Diaz." In this hospital, a number of our countrymen, sick and destitute, have received medical treatment and care and food, gratis.

The government of the city is so similar to that of cities of like size in our own country, as to render description unnecessary; and the same is true of the State government and the administration of justice generally. There is an iron foundry, and manufactories of clothing, carpets, soap, and ice, and a brewery. A furniture factory will be started soon. Some of these have concessions in the nature of exemption from taxation for from ten to fifteen years.

#### INDUSTRIES.

The principal sources of wealth in this district are stock raising and the mining of precious metals, silver predominating. The exports of ores and bullion (gold and silver) to the United States amounted to \$2,430,289.51, United States currency, for the last fiscal year. The United States duty on the lead contained in these ores is causing the erection of smelters and reduction works in Mexico, and is preventing the shipment of greater quantities of ore to the United States. The exports of neat cattle for the last fiscal year amounted to \$134,458.59, United States currency.

The cotton and cotton fabric for the clothing manufactories here come from the United States. The woolen cloth is chiefly made in

Mexico, except fine woolens, which come from Europe.

This is not an agricultural district, the rainfall and water for irrigation being insufficient. But little of any article of food is produced in excess of the wants of the people.

#### RAILROADS.

A new railroad, the Chihuahua and Pacific, is now being constructed, commencing at Chihuahua and running in a westerly direction. The first section of 200 kilometers (125 miles) is to be completed by December, 1899. This first section of the road is to receive a subsidy from the general Government of \$11,179.80 per mile in Mexican bonds, equal to \$5,152 per mile in United States currency. This section of 125 miles also receives a bonus from the State of Chihuahua equal to \$2,208 per mile, United States currency. This railroad will penetrate a rich mineral, timber, and cattle country, and will open a new and inviting field for our merchants and manufacturers.

The Mexican Central is constructing another railroad westerly from

Jimenez, a town 147 miles south of Chihuahua on their line.

This road, in its general direction and the character of country to be opened to the world by it, is so like the one above mentioned, that a description of the one serves for the other.

#### PRICE OF LABOR.

Unskilled laborers on the railroads and in the mines and factories here, earn \$1 per day, Mexican money, equal to 45 cents United States currency. Skilled laborers receive about the same pay in Mexican money, that such laborers receive in our country in United States money.

### IMPORTS FROM THE UNITED STATES.

The principal articles of American production and manufacture imported into this district are mining and agricultural machinery, hardware, wagons, carriages, household furniture, blooded animals for breeding, sewing machines, corn (in seasons of failure of crop), gro-

ceries, (such as bacon, lard, canned goods, and crackers), boots and shoes, hats, and dry goods generally.

I have no means of learning the total value of the articles imported.

# PROSPECTS FOR INCREASE OF TRADE WITH THE UNITED STATES.

I am convinced that there has been, during the last fiscal year, an increase in the business and industries of this district over preceding years, and that the Americans are gaining ground commercially.

The supposed prejudice against our people, because of a war fifty years ago, is no barrier to trade; but there are two obstacles worth mentioning. One is the ignorance of our solicitors of trade, who visit Mexico, of the language, modes of thought, and business methods of the Mexicans. A man trying to sell goods through an interpreter has about as much chance of success as one courting a woman in the same way.

Another obstacle is the disposition of many Americans, not always modestly manifested, to reform and "Americanize" everything with which they come in contact.

W. W. MILLS, Consul.

Снінианиа, July 18, 1898.

# CIUDAD JUAREZ.

This city is the most important place and practically, the only town in the district. It has a population of 8,000 persons. The rest of the population of the district is made up of miners and employees upon the cattle ranches.

### INDUSTRIES.

Mining and cattle raising constitute the chief industries of the Ciudad Juarez consular district. Ores and live stock form the bulk of the exports to the United States.

The operations of the present law of Mexico prevent the establishment of industries in the free zone. The product of such establishments would be subject to tariff duties, whether shipped to the United States or into Mexico.

The Juarez smelter, constructed and operated by American capital, is the only industry in this city. Two hundred tons of ore per day are concentrated at this plant. Its capacity is being steadily increased, and the company expects very soon to operate two additional smelters or furnaces. The gold, silver, and lead ores reduced and concentrated at this smelter are shipped to the United States. Some of the product also goes to Europe.

Aside from the smelting and concentrating works recently established in Ciudad Juarez, there is no manufacturing of any kind.

# MINERAL RESOURCES.

The opening of the new mineral country in the States of Chihuahua and Sonora by the construction of the Rio Grande, Sierra Madre and Pacific Railway, was the cause of the erection of the Juarez smelting plant. The raw material is drawn principally from mines tributary to

this new line. The road runs 150 miles southwest to Casas Grandes, and now hauls ores to market from about twenty-five mines. All the machinery used in the construction of the Juarez smelter came from the United States.

Mining development in this district is going steadily forward. In the Casas Grandes country, many valuable strikes are being reported, and there is a steady stream of prospectors pouring into the Sierra Madre Mountains. The mining laws of Mexico are liberal enough to warrant a persistent search for treasure, and protection and security are certain where a valuable claim has rewarded the labors of the prospector.

The machinery used in the mines recently opened in the Casas Grandes country comes from the United States, and principally from Youngstown and Columbus, Ohio, and from Chicago, Pittsburg, and St. Louis.

### THE MORMON COLONIES.

In the southwestern portion of this consular district there are thriving colonies of Mormons who number about 7,000 persons. They cultivate the valleys where irrigation is possible, and are now developing the timber resources of the Sierra Madre Mountains. They have established a canning factory, sawmills, and minor industries; but the output is consumed by the people in that section of the country. They are also engaged in mining and ranching, and cattle and minerals are the only exportations from their colonies.

# CATTLE RAISING.

The tables printed below show the quantity and value of the live stock and minerals exported from this district. The cattle business is the main reliance of the people living in the northern section of the State of Chihuahua. It has thrived for the past two years, and prices are still maintained so as to be profitable to the ranchmen and stock dealers. Kansas City is the principal market for live stock exported from this district.

### TRADE WITH THE UNITED STATES.

For the first six months of 1898, the United States exported through Ciudad Juarez \$1,731,371. Machinery and iron manufactures formed the principal items. Machinery entered at this port amounted to \$276,373, while iron manufactures aggregated the sum of \$393,486. Lumber, coal, drugs, explosives, wood manufactures, furniture, and canned goods were the other items of chief importance. These goods are distributed throughout the Republic.

According to statistics furnished by the collector of customs at El Paso, Tex., the total importations from Mexico at that port were \$3,824,197. The merchandise all passed through Ciudad Juarez, which is across the Rio Grande River from El Paso. Live stock and minerals

were the principal objects imported.

The United States practically controls the trade in this portion of Mexico, with the exception of dry goods and notions. These are imported from Europe; and while articles of clothing lauded in the free zone and handled by the merchants are cheaper in price, they are also inferior in quality to similar products from the United States. Shoes and cotton goods are supplied by manufacturers in Mexico; but there is a field, in this district, though somewhat limited, for articles of this kind manufactured in the United States.

Business houses in the United States who send representatives to Mexico to develop trade should always select men familiar not only with the language, but the customs of the Mexican people. Unless both are understood by the commercial traveler, his rival, who represents European establishments, has a decided advantage, for he is invariably conversant with the Spanish tongue, and takes into account the value of a thorough understanding of the methods of Mexican merchants and their manner of transacting business. He is careful to instruct his employers to pack the goods a certain way, and to fill the order to the least detail as the merchants expect, when they make their purchases.

The reports from all sections of Mexico are favorable to a steady development of trade and industries. A stable government and protection for capital is doing much to develop the resources of the country. With proper energy and direction commercial houses in the United States will be enabled to secure a greater share of the trade of Mexico than is now enjoyed, especially in clothing, cotton textiles, and hardware. Trade between the United States and Mexico is increasing every year, but it is larger with European concerns. It is within the range of easy possibility for our merchants to more evenly balance the exports with the imports. The disparity at present is too great to be pleasing.

# EXPORTS.

The following tables show the quality, the quantity, and kind of merchandise exported from this consular district from January to July, 1898, compared with the exportations from January to July, 1897:

Declared exports from the consular district of Ciudad Juarez, Mexico, to the United States during the first six months of 1897 and 1898.

### CIUDAD PORFIRIO DIAZ.1

Trade has improved somewhat in the last year. The city's territory, generally speaking, is confined to the free zone, which extends to about 12 miles from the Rio Grande.

The area of agricultural lands is being greatly increased. There are now about 40,000 acres under cultivation around the city, and crops of cotton, corn, wheat, and beans are raised. The coal fields are being greatly developed, especially by the Fuente Coal Company, a report of which is given further on.

#### IMPROVEMENTS.

The most noteworthy improvement is an immense irrigating ditch, which is now being dug, about 50 miles northwest of the city. irrigate about 25,000 acres of farming land. The length of this ditch is 13 kilometers (a little more than 8 miles), including a tunnel a mile and a quarter long. A double conduit, half a mile in length, with pipes 60 inches in diameter, will cross the Oregono Arrozo. All the pipe, as well as the implements and machinery used in the construction of the ditch, have been recently purchased in the United States. The ditch at the base is over 13 feet deep.

There will be nearly 50 miles of lateral ditches. The water will be taken from a small river near by, and there will be power enough to run a large cotton factory and three other mills, which the owner contemplates building. The owner, I am reliably informed, will buy all the necessary material and machinery in the United States. The cost

of the ditch alone will be \$1,000,000 (Mexican money).2

A new building, the Presidencia Municipal, is being constructed here. It is to be furnished throughout with material from the United States, and is to cost about \$15,000.

A new street sprinkler was recently purchased from a South Bend,

Ind., firm, at a cost of \$1,100, including duties.

The Mexican International Railroad Company, an American company, having its headquarters here, is building a structure on the depot grounds which is to be 60 by 32 feet, outside measurements. It is constructed of brick, on rock and concrete foundations, with rock trimmings. It is to be used for general purposes, such as school rooms and

lecture halls, and will cost about \$5,000 (Mexican money).

The company is also constructing a new shop building, 90 by 280 feet, which will be divided into a machine, blacksmith, and boiler shop, at a cost of about \$30,000. It will be equipped with modern machinery and all modern appliances. The power will be steam, electricity, and compressed air. The shops will have outside walls of gray rock from the Castano quarry, and dividing walls of brick, with roof trusses of steel, supported by iron columns and covered with Fletcher patent roofing.

### TARIFF RATES, COMMERCE, ETC.

The import duties remain the same—17 per cent of the regular duties. The Mexican International Railroad Company is just completing an extension from Reata to Monterey, and through these extensions improving the facilities for transportation.

<sup>&</sup>lt;sup>1</sup>In response to circular of August 5, 1898. 2\$477,000 United States gold (January, 1899).

### AGRICULTURE AND MINING.

The land is made productive through irrigation, and an increased area is being opened up in this manner, each year. The cotton crop this year will be about 7,000 bales. Truck farming is carried on very successfully, but only to the extent of supplying this city and Eagle Pass, Tex.

The coal fields are being very extensively worked, and that industry is assuming large proportions. The Coahuila Coal Company makes about 13,000 tons of coke per month, and is the only company in the Republic of Mexico in this branch of industry. It also takes out about 3,500 tons of coal a month.

The Alamo Coal Company takes out 11,000 tons a month, and the Fuente Coal Company, 8,000 tons. About 11,000 tons are shipped monthly to the United States. These mines are all owned and controlled by the Mexican International Railroad Company.

### POSTAL AND EXPRESS RATES.

In the free zone, the letter rate is 5 cents, Mexican silver, for each 15 grams or fraction thereof (2½ cents United States currency per one-half ounce); for a registered letter, 15 cents extra. The Wells-Fargo Express Company has permission to carry letters, and sells stamped envelopes for 15 cents each, Mexican silver.

Outside of the free zone, the letter postage is 10 cents for each 15 grams or fraction thereof, and 15 cents extra for a registered letter.

To the United States and Canada, the letter rate is 5 cents, Mexican silver, for each 15 grams or fraction thereof; for each postal card, 2 cents.

To other countries in the postal union, for each 15 grams or fraction thereof, 10 cents; for each postal card, 3 cents. To countries not in the postal union, for each 15 grams or fraction thereof, 20 cents, Mexican silver.

There is no law requiring goods to be marked so as to show the country of origin or manufacture. However, I am informed that the numbers on boxes, packages, etc., usually show the place from which they are shipped, as well as origin and place of manufacture.

# EXPORTS AND IMPORTS.

The exports and imports vary but little. The principal article of export is coal.

Î give below a report from the Mexican custom-house, showing the importations for the six months ending June 30, 1898.

Statement from Mexican custom-house at Ciudad Porfirio Diaz, Mexico, showing importations from the United States for the six months ending June 30, 1898.

CHAS. P. SNYDER, Consul.

### DURANGO.

### EXPORTS AND IMPORTS.

Durango being an inland city, with no custom-house, there is no official means of obtaining information as to the imports to this consular district from the United States. I feel warranted in saying, however, from personal observation, that the trade has almost doubled within the last year or so. As in all parts of the Republic, the tendency heretofore has been to import everything from Europe, but with the increased number of Americans coming here to do business, and the energy of some American dealers at home, this tendency is fast being overcome, and Mexico is now getting most of her foreign-bought goods from the United States. However, I do not consider that we should divide Mexico's trade with Europe; we should have all of it. We are her next-door neighbor, with every facility for supplying her wants. The only hindrance is the inactivity of our manufacturers. The field is not properly worked, but the fault is fast being remedied.

The exports from this consular district to the United States for the fiscal year ended June 30, 1898, show an increase of \$130,618.55 over

the previous year. The amounts for the two periods follow:

1697	
1898	1, 022, 187, 06
	_,,,

The exports for 1898 are divided as follows:

Silver bullion	\$565, 088, 23
Gold bullion	
Lead bullion	73, 259. 10
Other articles, chiefly beans, cotton-seed cake, skins, horns, and horsehair	97, 872. 95

# INDUSTRIES.

The principal industry of this country is mining. The State of Durango has of late years come to the front as one of the first silver-producing sections of the world. While some gold, lead, and other minerals are taken out at almost every mine, the main product is silver. The amount of work done and the importance of some of these may be judged from the fact that at several mines, from 600 to 800 men are worked in shifts day and night.

Besides mining, attention is given also to the timber and lumber business, stock raising, and farming. In the western and mountainous part of this State, I am told there is an almost inexhaustible supply of good timber—mostly pine, though some cedar and other useful woods are found. Sawmills are located at different points in the timber region, and do a good business so far as the limited means of transportation will permit. This, however, is a great drawback to the lumber industry. In fact, it can hardly be considered an industry until such time as the timber section is opened up by railroads. I have just been informed of a recent purchase by an American concern of some 200,000 acres of this timber land.

In the way of stock, cattle, horses, sheep, and goats are raised principally. Of course, with horses is included the irrepressible burro of the Mexican, which is the most useful of animals in a country like this. He climbs mountains that are almost impassable even to man, and takes supplies to and brings away ore from mining camps where a wagon or other vehicle was never seen.

Farming is carried on here on a very limited scale. The products of this immediate vicinity are chiefly corn, beans, and the smaller grains. The latter, however, can hardly be considered at present, their cultivation having hardly passed the experimental stage as yet. In the lower or eastern part of the State, and that part of the State of Coahuila included in this consular district, considerable cotton is grown.

# THE CITY OF DURANGO.

Durango, the capital of the State of the same name, has a population variously estimated between 40,000 and 60,000. Perhaps, a fair rating would be half way between the two extremes. The city has a State and a municipal palace, three banking houses, and two American hotels, one of which, the San Carlos, is modern in every respect and as well appointed an establishment as will be found in almost any city of the size in the United States. It has been opened within the last month. There are also some four or five Mexican hotels. Mercantile houses are very different from those in the United States. Here, if you want a pound of candy, a sheet of writing paper, or a cooking stove, you go to a hardware store for it. Of these there are five or six. The dry goods stores do not keep such a diversified stock. They are some ten or twelve in number. Of the grocery stores, there are none here that would be considered first class, according to the American idea, although there are a dozen or so that outrank the common establishments.

The present municipal administration has lately taken up the matter of city improvement, and as a consequence, Durango can now boast of plazas, alamedas, and driveways equal to any in the Republic. The city is lighted with modern are lamps, a very recent improvement. There are three electric-light plants in the city, an ice factory, one American furniture factory and several Mexican factories, two iron foundries, a steam laundry, a cotton factory, a planing mill, and a flour mill.

### RAILROADS.

There is at present but one railroad running into Durango—the Internacional Mexicano. There is much talk of extending the road across the Sierra Madre to the coast. In fact, the surveying party is at present out in the mountains running the line for the proposed extension. While the cost of this work will be heavy, I expect to see the road in operation within the next few years, notwithstanding the opinion of many people here that it can not be built. This will open up a region hitherto almost unknown, besides bringing us within a few hours' ride of the Pacific Ocean. The advantages which would accrue from its construction can hardly be calculated. I believe that if this connection is made, it will shorten by six or eight days the time from Australia and Southern Asia to New York.

### CLIMATIC CONDITIONS.

I doubt if the climate of Durango is excelled by any in the world. In summer, the temperature is never above 70° or 72°, and in winter never below 30°, and very seldom even that low. While this is rather high, it should not be inferred that it is a mountainous country here. The city is situated upon a high plateau 6,300 feet above the sea level, and the mountainous region is about a day's ride on horseback from

here. It is one of the most healthful cities in Mexico, and offers far greater inducements to the health seeker than many of the famed resorts in the United States.

WALTER H. FAULKNER, Consul.

DURANGO, November 12, 1898.

## LA PAZ.

Considering the depopulated condition of this consular district, it would be impossible to prepare as comprehensive a statement of its trade and industries as would be desirable for information of general interest.

# TRADE WITH THE UNITED STATES.

Foreign trade is carried on almost entirely with the United States, the exports consisting mainly of silver bullion, hides, pearls and pearl shells, salt, sugar, fish fins, fruits, etc., while the imports include general merchandise, lumber, and machinery.

The following is a comparative statement of the imports and exports

for the fiscal years 1897 and 1898:

Year.	Imports.	Exports.
1897	\$53, 574. 49 88, 069. 87	\$334, 649. 54 662, 535. 87
Increase	34, 495. 38	327, 886. 33

### MINING.

The condition of the mines in this district continues normal. There are only two companies in operation—one the Santa Rosalia copper mines, employing some 3,000 hands, and the other, the Progress Silver Mining Company, of Triunfo, with about 1,200 miners. These two concerns are in reality the mainstay of the country. The Santa Rosalia mines have a continuous output of from 800 to 1,000 tons of copper per month, and as they also contain a considerable amount of gold, this enhances the value of the production. The copper is generally shipped to Europe via New Orleans, and sometimes by sea on sailing vessels.

It is reported that the Rosalia Company, which is a French corporation, receives magnificent profits from these mines, which produce lowgrade ores, but in immense quantities, which, combined with the low cost of production, the miners' wages being payable in silver while the products are sold for gold, gives them a decided advantage.

In the mining business, it is thought there is an extensive field for prospectors on this peninsula. The conditions for prospecting are quite favorable and miners can be obtained at \$1 to \$1.50 per day, Mexican silver. There are a number of outcroppings and mineral ledges throughout the district which appear promising, and would warrant an examination by competent mining engineers.

<sup>&</sup>lt;sup>1</sup> In response to circular of August 5, 1898.

#### AGRICULTURE.

The agricultural pursuits of this country are still in a very primitive state, and although the lands produce all sorts of cereals, fruits, sugar cane, coffee, etc., no efforts have been made to extend this important industry beyond the cultivation of those spots watered by natural springs. The sugar production from such places in the last season was estimated at from 3,000 to 3,500 tons, with a profit to the producer of from \$25 to \$30, Mexican silver, per ton. There is no question that if irrigation should be extended, either by a system of dams or artesian wells, the abundance of wealth which the soil could produce would be incalculable. The amount of land now uncultivated is vast, and the price per acre does not exceed \$1, and in many instances, it is less. Artesian-well projects have been amply discussed here, and it is thought that by boring, water could be obtained in many localities; but the lack of capital and enterprise has deferred these projects indefinitely. There is no doubt that the country affords very favorable opportunities for the right class of people.

### PEARL FISHERIES.

The pearl fisheries of this coast were considered at one time of some importance, but owing to the lack of systematic working, they have become almost extinct. The shell is small and of medium quality, but the pearls are generally of fine quality and luster. The prevalent opinion is that the mother-of-pearl oyster can be cultivated like other bivalves; in fact, there is now a small bed under cultivation, out of which, after two years' growth, 10,000 oysters were taken, yielding \$500 in pearls. While this is merely a small experiment, it demonstrated that the project is feasible, and to what extent it could be carried, would only be a matter of capital and enterprise.

There is a party here from New York now, experimenting and studying the habits of the oyster, with the object of trying to transfer them

into waters of the United States.

JAS. VIOSCA, Vice Consul.

LA PAZ, September 25, 1898.

## MATAMORAS.

### SITUATION.

Matamoras is situated on the right bank of the Rio Grande, some 25 miles from its mouth, 165 feet above the sea level, in longitude 97° 26' west from Greenwich and latitude 25° 53' north.

# HISTORY.

It was the first port in the zona libre (1851), and, situated upon the border, has had a very eventful history. Besides many internecine quarrels, it has witnessed the outbreaking of all the revolutions of importance. Realizing this fact, and in order to lessen the possibility of any sudden uprising in the future, a full garrison of troops is constantly maintained here, and this city has been made the headquarters of the fourth military zone of the Mexican Government.

<sup>&</sup>lt;sup>1</sup> In response to circular of August 5, 1898.

A glance at the records of this consulate is sufficient to reveal the fact that, during the civil war, Matamoras, a city whose population was then estimated at from 40,000 to 50,000 inhabitants, was one of the principal commercial ports of the world. At that time, the entire trade of the interior of Mexico was carried on through this city. But the lawless acts of an indigent class, under the guise of patriotism, have many times plunged this section into chaos, and this has had its influence in impeding commercial prosperity. The principal cause of the steady decline of trade, however, is due to the fact that the American railways to the upper border now carry all the importations into the interior, and have left this city comparatively little save what is necessary for local consumption.

#### EXPORTS AND IMPORTS.

The marked decrease both in imports and exports during the past year, has been largely due to the anomalous condition of affairs caused by the Spanish-American war, during which time the Government's withdrawal of ships caused a complete suspension of traffic. However, frequent rains have rendered irrigation wholly unnecessary, and fruits, sugar, cotton, and corn have been produced in abundance. The cotton formerly exported to the United States or Europe now goes to the interior, where there is a good and annually increasing market. present tariff and high market price on this side have also had an influence in decreasing the trade in cattle, which is the principal article exported.

The principal imports for home consumption alone, consisting of wines, liquors, lumber, breadstuffs, groceries, and canned goods, cotton and woolen goods, hardware, etc., during the fiscal year ending June 30, 1898, amounted to \$189,740. It seems strange that, situated on the border, one-third of this amount, consisting principally of liquors, woolen goods, and hardware, is imported from Europe. The principal exports are cattle, horses, mules, hides, hair, skins, bones, cotton seed, etc. During the fiscal year ending June 30, 1898, they amounted to \$109,727.74, which shows a decrease of \$41,066.78 as compared with the

exports of the fiscal year ending June 30, 1897.

### TRANSPORTATION FACILITIES.

The existing transportation facilities here, internal and coastwise, are, in a manner, sufficient for the present traffic, but are wholly inadequate for the development of trade and commerce of which this region is capable.

Primitive methods are employed in order to carry supplies to the interior towns, while those situated along the border have the advantage of the river and also of the only railway here, which is called the Matamoras and Monterey road. It is owned and controlled by the Mexican National, and is completed as far as San Miguel. The equipment is fair, and it has the appearance of being well managed.

At Brownsville, however, is the Rio Grande Railway, with its eastern terminus at Point Isabel. As the anchorage for ocean steamers is off Brazos Island, in Laguna Madre, 3 miles from Point Isabel, all freight has to be taken from the ships in lighters. Likewise, that which is intended for Matamoras is landed at Point Isabel, and consequently passes through the custom house at Brownsville, for the old Mexican port of Bagdad, at the mouth of the Rio Grande, has long since been closed, and the river is navigable only for small vessels.

#### COMMERCIAL CREDITS.

It is customary to allow the merchants here a credit of thirty, sixty. The legal rate of interest for the State of Tamaulipas, or ninety days. and the rate usually employed in most transactions, is 1 per cent per month.

#### INDUSTRIES.

The industrial activity of Matamoras and of this consular district, on account of the unsettled political conditions in the past, a lack of native capital and enterprise, and poor transportation facilities, has been retarded, so that at present, the principal factories consist only of two cotton gins, an ice factory, a sugar refinery, a tannery, several soap factories, brickyards, and a few small tobacco factories.

### GENERAL.

This is undoubtedly one of the richest agricultural regions of Mexico, and the vast natural resources have long lain dormant. It lies on what would be the most direct route, by 500 miles, from Houston, Tex., to Mexico City. Irrigation is in its infancy, and possibly on account of its isolation, Matamoras has few modern improvements, such as electric lights, waterworks, etc.

Realizing these conditions, and the fact that many valuable privileged concessions could be easily secured, I hope in the near future to call the attention of some of our agriculturists, capitalists, and manufacturers to the existing conditions here, in detail, and to show where the investment of a little American capital and the intelligent application

of labor will result to their immediate advantage.

P. MERRILL GRIFFITH, Consul.

MATAMORAS, October 6, 1898.

### MAZATLAN.

But little is known in the commercial centers of the United States of

Mazatlan, its business, or its future.

The total sales of merchandise for six months ending June 30, 1898, were almost \$18,000,000 (\$8,136,000 in gold), an increase of over \$3,500,000, silver, over the corresponding six months of 1897. There is no American firm here engaged in the general mercantile business. It is mostly done by German, French, and Spanish establishments. They all carry very large stocks of general merchandise, and most of them are branches of European houses. Their agents, residing in their native land, send large sailing vessels here semiannually.

Many years of hard work and close attention to the wants and wishes of the Mexican people have enabled German and French houses to secure a solid hold on the business of this State. Germans, especially, by their great energy and activity, almost control the sale of general merchandise. Even in the line of pianos, all of which should have been sold by the United States, official reports for 1897 show that

almost \$500,000 worth were made in Germany.

In response to circular of August 5, 1898.

From thirty-five years of active business experience I have always favored the creation of a department of commerce, the head of which should be a member of the President's Cabinet, and from what knowledge I have gained in the consular service, I see the necessity of it still more. Many foreign nations have such a department. In Mexico, it is called the department of promotion of industries and commerce, and has done much to improve the commercial condition of this country. France has such a department, always in close touch with the French boards of trade. Russia has a splendidly organized commercial department, at the head of which are two ministers of commerce, one in charge of Russian interests in the far East, and the other for the continent of Europe.

It will require an enormous amount of energy and enterprise for the United States to do a successful business with Mexico. Circulars and advertising will not do it. Personal solicitation and determined push are the only means by which Americans can secure business here.

### BUSINESS OPPORTUNITIES.

I would suggest to those wishing to extend their trade with Mexico, to send small consignments of carefully selected and assorted goods to well-known and responsible houses. I think this would be the right

step to secure a favorable reception.

Although Mazatlan is situated near to the United States, it is a fact that hardly 30 per cent of her imported goods come from the States. Manufacturers of mining, agricultural, and sugar-making machinery should have offices here, with men of experience and good business habits at their head. Mining is one of the chief and most profitable industries of this State, and is steadily on the increase. Some of the near-by mines pay immense profits. The Sajo mine and one owned by the Echegureno Company, pay to their owners over \$1,000,000 per annum.

Deep-well boring is almost unknown here, and a fortune awaits any-

one who would successfully start and carry on this business.

The city needs a good flour mill, as well as a large paper mill, and the Government would grant a very liberal concession to anyone starting them.

# COTTON GOODS.

Our large Eastern cotton mills should control the importation of all cotton goods at this place; but at present, the United States supplies but 25 per cent, while England ships more than 33 per cent. If American manufacturers and exporters would organize branch houses in the most important trade centers, trade would be established in a few years.

From personal information, I find that American exporters have injured their trade prospects a great deal by ignoring the business customs and methods of the Mexican merchants, and trying to force their own methods upon them.

#### HARBOR.

Mazatlan has over 16,000 inhabitants and is rapidly growing. It will soon have the finest harbor in Mexico, as such is the determination of the Mexican Government. They have appropriated \$15,000,000 for this purpose, but owing to the general depression in all branches of industry, work had to be postponed.

 $\mathsf{Digitized}\,\mathsf{by}\,Google$ 

### RAILEOADS.

There are no railroads here now; two concessions have been granted, one for a road to run via Rosario to the United States, which will open up the richest mineral and agricultural district of the State, and the other for a road to be constructed in the opposite direction.

# CITY IMPROVEMENTS.

Several large commercial blocks are being built, and a fireproof market, which will be the largest and finest in Mexico, is now being erected at a cost of \$200,000. There are three large banks in the city, while nearly all the wholesale houses have a banking department connected with them.

There are two electric-light plants, a system of waterworks, two ice plants, and a street-car line.

Mazatlan pays over one-half of all the taxes collected in the State.

#### INDUSTRIES.

The American firm of Felden Brothers operates large carriage, wagon, match, harness, and ice plants, and employs over 300 men. One of the most profitable plants is an immense foundry, owned by a Spanish firm, which annually declares an enormous dividend.

There are five large tobacco factories in Mazatlan. Three of them make 4,500,000 cigarettes and 36,000 cigars weekly. They employ over 300 men and girls, who earn about 75 cents (Mexican) each per day.

Seven shoe factories make an average of 1,260 pairs of shoes daily, which average about \$1.50 (Mexican) per pair. They employ about 200 men and women. Most of them do the work at their homes.

# EXPORTATION OF DYEWOOD.

There were 96,198 quintals of dyewood shipped to the United States from 1886 to 1893, valued at \$195,173 (Mexican).

Among the above woods were ebony, white ash, and red cedar. Since

1893, no wood has been imported into the United States.

All the dyewood exported from here is by German and French houses. It is sent to Havre or Hamburg. The most important dyewoods exported are Brazil logwood, mora, and yellowwood. There are three houses engaged in this trade, which export about 3,000 tons of Brazil logwood, valued at \$18 to \$22 (Mexican) per ton, and 3,000 tons of mora, valued at \$8 to \$12 (Mexican).

# COTTON GOODS.

A large and well-equipped cotton mill is doing a thriving business here. They make cotton goods similar in weight, texture, and pattern to those made by the smaller mills in the South (United States). Both the imported and the domestic article are sold for almost four times their price in the United States; standard American prints costing from 4 to  $4\frac{1}{2}$  cents sell here for 18 cents per yard, and other goods in proportion.

Statistics are everywhere difficult to obtain, proprietors of all establishments being generally unwilling to furnish any information. Even the custom-house has refused to give a statement of the imports and exports of this port, pending specific directions from the state depart-

ment.

### FREIGHTS, TAXES, ETC.

Few American goods are sold here, besides hardware and machinery. A recent law gives all freight in any port in Mexico to Mexican vessels. Any excess which those vessels can not carry, can be shipped by American vessels. Commercial travelers need no passports, but have to pay a very heavy tax for the privilege of selling goods by sample in this city. The tax varies from \$50 to \$300, according to the class and value of the goods to be sold. Most of the traveling men refuse to comply with this law.

In Mexico, everybody pays a direct tax, from the street porter to the largest merchant. All commercial account books, documents, checks, receipts, and notes must have revenue stamps attached. I wish to call special attention to the remarkable fact that business failures and fires are almost unknown here, none having occurred for the last fifteen

years.

### DEVELOPMENT OF GERMAN TRADE WITH MEXICO.

In conclusion, I would call the attention of our manufacturers and exporters to the tremendous activity of German shippers in the Mexican markets and the increase of their merchant marine, their ships all manned by German sailors. We should not allow ourselves to be excluded from a market which should belong to us, and which we can have if we will only work hard enough for it.

# SUPPLEMENTARY REPORT.

While the eyes of the American importer and manufacturer are turned toward our newly acquired possessions, with a view of extending our commerce there, it is well not to neglect those foreign countries to whose trade America is justly entitled. The commerce of Mexico, by our own fault, is slipping into the hands of the ever active nation of Germany. While this is painfully true of the whole of Mexico, it is especially the case with the western coast. Though so close to the United States, hardly 30 per cent of the imports comes from our country. Germany is putting forth an immense amount of energy to increase its commerce with Mexico, secured by many years of patient toil and close attention to the wants of the people.

<sup>&</sup>lt;sup>1</sup>This report was written at the request of a St. Louis journal, to which a copy was sent.

There is a good field here for the establishment of a large warehouse for the sale of all kinds of mining, agricultural, and sugar-manufacturing

machinery.

Mazatlan is the most important city on the Pacific Ocean, in the State of Sinaloa. It has over 16,000 inhabitants, and the sales of merchandise, as reported to the tax collector for the last year, were valued at \$40,000,000, an increase of \$7,000,000 over the previous year. This large and very profitable business is mostly in the hands of Germans. There are also French and Spaniards, but not a single American firm.

Mazatlan is to this coast what Chicago is to the West, and is improving very fast. The Mexican Government has lately granted a very liberal concession to build and operate two lines of railroad, starting from

here and running in opposite directions through the State.

Prominent railroad men inspected, last month, a proposed line from Durango here, and a French agent has been looking over the field, with

a view to establishing a line of steamers from here to France.

There are good banking and telegraph facilities, and street-car lines; also, large wagon, cotton, match, cigar, chocolate, trunk, and soap factories, two ice and two electric-light plants, and a first-class foundry.

All factories that are run on strict business principles pay from 25

to 30 per cent profit on capital.

Some of the largest and best-paying mines in Mexico are located near here, two paying the owner over \$1,000,000 profit each per annum.

There are hardly any American goods on the market except hard-

ware and machinery of all kinds, of which there are good stocks.

I can not procure the total amount of import and export of this port, except in gold, silver, and lead ore, the value of exports of which during the last fiscal year was \$4,329,300.40 (Mexican).

There is also a large export trade in alligator skins, dried hides, salt fish, shrimps, tortoise shells, coffee, feathers, and cocoanut-oil cakes. The climate is very healthy, and almost a paradise from November to

June, when hundreds of invalids come here.

In order that Americans may secure a foothold here, I would suggest the opening of branch stores in the most important commercial centers of Mexico. It would also pay to send well-assorted sample lines of merchandise to the best-known houses. It is hardly any use to send circulars and price lists; send your best salesmen, who can speak Spanish.

The sewing machine manufacturers took the proper steps to get a good footing, by opening an office in every available city, putting only the best men in charge. They have doubled their business in Mexico in the last year. This country offers a splendid field for capital with

business experience and energy to back it.

LOUIS KAISER, Consul.

MAZATLAN, October 30, 1898.

### SALTILLO.1

### EXPORTS AND IMPORTS.

In spite of the war and yellow fever quarantines, which have tended to interrupt traffic, there has been, during the first half of 1898, a considerable increase in the leading exports from this district to the United States, as shown by the following comparison:

	189	7 <sub>e</sub>	1898.	
Articles.	Mexican currency.	United States currency.	Mexican currency.	United States currency.
Copper matte and lead bullion. Goatskins Ixtle Horse and cattle hair. Miscellaneous	\$235, 330. 79 94. 376. 08 97, 171. 68 5, 243. 80 1, 066. 75	\$120, 254 48, 226 49, 655 2, 680 545	\$306, 598. 63 129, 364. 44 31, 773. 73 6, 705. 78 5, 554. 35	\$138, 583 58, 473 14, 362 3, 031 2, 510
•	433, 189. 10	221, 360	479, 996. 93	216, 959

Note.—The increase in Mexican currency was \$46,807.83. The increase does not appear in the United States equivalents on account of the depreciation of silver during the period. According to United States Treasury estimates, the value of the Mexican dollar in the first six months of 1897 was \$0.511; in the corresponding period of 1898, \$0.452.

There has been no marked development in imports, as a whole. Certain lines, notably bicycles and railroad construction material, show a decided increase. Importation of textiles and furniture has decreased, owing to the establishment of home manufactories. Trade in boots and shoes is practically unchanged. While United States goods are superior in style, and, at least, equal in quality, these goods are not desired by the native population, and many resident Americans prefer to pay a native shoemaker \$8 (Mexican) for a substantial pair of shoes rather than purchase an imported article, a little more stylish, but of no greater durability, at \$10 or \$12 (Mexican).

#### TRANSPORTATION FACILITIES.

Transportation facilities to points in my district are excellent, and are constantly growing better. The Mexican National Railroad gives quick service from Laredo, Tex. During the past year, the Coahuila and Zacatecas Railroad has been built, and is now in successful operation, between this city and Concepcion del Oro (in the State of Zacatecas), a rich mining district. Final surveys have been made and ground has been broken during the past month on the Coahuila Central Railroad, the construction of which now seems to be assured, and which will connect Saltillo with Treviño, tapping the Mexican International and the Monterey and Gulf railways at the latter point. The concession for this road, which is being built by American capitalists, carries with it the guaranty of a \$100,000 modern hotel, to be built at Saltillo.

### INDUSTRIES.

As transportation facilities increase industries, are springing up, largely capitalized by Americans. We have three flour mills here at present—one of them equipped with the latest roller process—and all turning out a good grade of flour. Another flour mill is projected and will probably be built within the next twelve months. The machinery for all of these mills comes from the States. There are also two cotton mills, which are at present manufacturing cotton textiles of the quality and texture required by the people, at a lower price than the same goods can be imported. In fact, at least one of these mills is a large buyer and importer of raw cotton from Texas and neighboring points, for manufacture here.

The low price of silver, the high tariff, and the failure of manufac-

turers of the United States to cater to local tastes, as also the allowance of comparatively short credits, have all tended to build up native manufactories.

## WHY THE UNITED STATES DOES NOT CONTROL THIS MARKET.

In conclusion, allow me to say that while Mexico offers, at our very doors, a most desirable market for our surplus products, and while we can manufacture a better grade of machinery, tools, etc., than any other country in the world, this market is being supplied from foreign sources, because—

First. Manufacturers in the United States have not yet generally sent competent Spanish speaking representatives, familiar with the customs of the country, to secure the trade.

Second. Because they have insisted on doing business in their own way, and have not conformed themselves to the slower methods of the

people with whom they were dealing.

Third. Because they have not catered to the peculiar local demand. If the Mexicans have wanted plows with one handle, they have insisted

on selling them their plows with two handles.

Fourth. Because the tariff has enabled the Germans and English to import to this country, goods which could be sold at a profit of 50 per cent above the actual price on similar goods imported from the United States; as, for instance, enameled ironware (which the Germans make lighter in weight and apparently equally serviceable), cutlery, and toilet articles.

CHAS. BURR TOWLE, Consul.

Saltillo, November 1, 1898.

#### TAMPICO.1

Tampico is only important in the world of commerce as a port of entry and shipment.

The city produces nothing, has no manufacturing industries except an oil refinery, and of itself consumes no more of the merchandise of the world than its population of 14,000 eats, drinks, and wears.

The country adjacent and tributary hereto, though naturally rich in soil and with a fine climate, suffers from drought frequently, thereby making the products of the farm an uncertain factor, and retarding the

development of the country.

As a port of entry and shipment, its importance to the Republic of Mexico is great. Having no rival port to the north and none of importance within 200 miles to the south, the supplies and merchandise to and from the rich and populous interior must necessarily pass through here, and, as such a port, Tampico will grow in shipping and in general

importance with the growth of the interior.

The statistics of shipments presented herewith, as taken from records of this consulate, do not show the true amount of trade through Tampico to the United States, because the bulk of the products of the interior, from Mexico City, on the south, to Chihuahua and Monterey, on the north, though shipped on steamers from this port, are invoiced in the various consulates covering the districts of production, so that to get even an approximate value of shipments to the United States through Tampico the statistics of consulates north of Mexico City should be consulted.

The figures for this consulate from January to July are—	
1897	608
The shipments consisted principally of bullion, skins, hides, a honey. Thirty to forty carloads of tomatoes were shipped by rail to tunited States, and an increased acreage prepared for this year wou indicate growth of this export.  The money value in gold of all goods received at Tampico during thirst six months of 1898, was as follows:	he ıld
United States       \$710,         England       367,         Germany       256,         France       180,	628 959 166
Total	-
From this it will be seen that receipts from the United States almosqualed in value the receipts from all other nations combined.  The principal items imported from the United States were—	ost
Gold	l.
Lumber and piling.       \$130,         Coke       114,         Coal       90,         Oil, crude       109,         Miscellaneous       266,	532 072 375

### TUXPAN.1

#### LOCATION.

The consular district of Tuxpan lies between the districts of Vera Cruz and Tampico, and includes about 60 miles along the coast toward Tampico, 60 miles toward Vera Cruz, and 60 miles inlaud from the coast.

The town of Tuxpan is nearly 200 years old. It is built back 9 miles from the gulf, on the banks of the Tuxpam River, which would be navigable for large ocean steamers were it not for the sand bar formed across the mouth of the river. Ocean steamers are loaded in the open gulf from lighters. Small vessels from Texas and Louisiana run here regularly, and discharge and take on cargo for 30 miles up and down the river.

### INDUSTRIES.

There is but little agriculture in this district, although the lands are rich beyond description. Everybody is engaged in robbing the land of its valuable timber—cedar, mahogany, dye woods, zapapote, and chicle. Their extravagant and wasteful methods are already telling upon the amount of exports. This is most noticeable in the case of chicle, on account of the wholesale hacking and unnecessary bleeding of the trees. The product of chicle has fallen off from \$661,746.81 in the year 1893 to \$169,359.54 in 1897, partly because of shrinkage in yield and partly because some 1,500 chicalaros have left here annually for the last three seasons for virgin chicle forests in the State of Yucatan. Chicalaros are not satisfied to work more than three to five months of the year; the balance of the year they must spend in carousing and hilarious living, and they go where the yield will afford it.

When this prodigal method of business and profligate manner of living ceases, and the people turn their attention to the soil, more true wealth will be enjoyed and a greater export trade will then be possible.

Cocoanuts, bananas, lemons, oranges, pineapples, cocoa, coffee, vanilla, rubber and tobacco, fish, oysters, turtle, and shrimps are abundant; but no use is made of this wealth beyond local consumption.

# EXPORTS AND IMPORTS.

Both export and import trade are on the increase at this port, barring the one item of chicle and a temporary suspension in the shipping of coffee, on account of the low prices now prevailing.

The exports of this port go mainly to the United States. The com-

plete list appears at the end of this report.

The imports are divided between the United States, France, Germany, Spain, and England. Imports from the United States are increasing in the lines of lumber, hardware, cutlery, wire fencing, sewing machines, American clocks and musical instruments, drugs, patent and other medicines, perfumery, toilet articles. Some wines and most of the surgical instruments sold here are of French make. Germany sells many lines of goods, German local merchants favoring their fatherland with their orders. At one time, much of the hardware and cutlery sold were of German make, on account of the low price. To-day, a German machete can not be sold at any price if the purchaser knows it.

The peon, who can not read a word, has learned to tell an American blade by blowing his breath upon it. He also avoids the swan stamped

Digitized by Google

on German blades. I do not think an American blade could be sold here if a swan were stamped on it. Spain also receives a share of the Mexican trade through the Spanish merchants who live here. English goods have a fair sale.

### HOW TO INCREASE AMERICAN TRADE.

American goods are in good repute, and more could be sold if Spanish-speaking agents from our country would be sent here, in place of Spanish printed circulars. There is nothing in the way of selling American goods in this market, if we will only show our goods and push for the trade, as the French and Germans do. The language is the only obstacle.

A mild-mannered, easy-going person is the one who will sell goods to these people. A man exhibiting the rushing, "lightning express" method we have of soliciting business at home, would be a worse failure in this mañana country than he who could not speak a word of Spanish, and worked entirely through an interpreter.

We should send goods in our own ships. To send American made goods in foreign ships with foreign crews, officers, and masters is very much like sending the gospel by unbelievers, savages, and heathen, and

expecting spiritual success.

# NEED OF BETTER TRANSPORTATION FACILITIES.

There are no arbitrary customs or port regulations here. Everything works smoothly. A weekly line of steamers to touch at this port is all that is lacking. With a liberal policy toward this port in the way of weekly service, the trade at this port from now on will show a satisfactory increase.

When the Hidalgo Railroad from the City of Mexico to this place is completed and the sand bar in the mouth of the river removed, the short distance to the capital, and the natural fertility of the country will make Tuxpan the gulf gate and chief port of Mexico, and its beach

the resort and watering place of the capital city.

A. B. JONES, Consul.

### SUPPLEMENTARY REPORT.1

I have interviewed the leading merchants in different branches of trade in this place, touching the questions of the obstacles, if any, existing in the path of trade between Mexico and the United States, the countries from which they bought their goods, why they preferred to buy them in remote markets rather than in our country, and whether the American system of packing was inferior to European methods. The consensus of opinion with regard to packing, was that United States exporters had been greatly at fault during past years, but recently, they had improved and their methods would now compare favorably with those of any other people.

The suggestions offered upon the subject were that goods should be packed as light and as strong as possible, and be adapted for mule-back transportation, for there are no roads or railroads in this district, and

pack mules are used all the time.

All were unanimous in saying that the greatest difficulty in the way of increasing our traffic lay in the failure of our merchants and shippers to acquaint themselves sufficiently with the requirements of Mexican tariff laws, so as to avoid fines and double duties, with the attendant trouble and expense.

Mexican tariff rates are not for revenue only, but for revenue and protection, and are almost prohibitory on such goods as the Administration wishes to have manufactured at home; and when double or triple duties are collected, our merchants must stand the loss. Then they blame the Mexican customs officers when the real trouble lies in

ignorance of tariff requirements.

Some commodities are dutiable by weight and some by length; some pay on gross weight of the package, some on legal weight, and some on net weight. Gross-weight packages should be as light and as strong as possible. Legal weight includes the goods and all inside wrappings—everything but the outside case—e. g., the straw packing around crockery and glassware, etc. Net weight is the weight of the article itself, exclusive of the bottle, can, or wrapper containing it.

<sup>&</sup>lt;sup>1</sup> In reply to inquiries from the Philadelphia Commercial Museums, November 25, 1898.

The duty on hardware in most lines is on gross weight; on shoes, according to length in centimeters. Most of the hardware sold here is of American make.

Drugs are imported chiefly from France. Some come from America, but more could be sold here. Surgical instruments are almost all of French make. The reason for the French predominance in this market is that nearly all medical students in Mexico use French books and are

accustomed to the French surgical and pharmaceutical names.

Dry goods, woolens, and silks mostly come from Manchester, England. I asked several dealers why they bought silks in Europe when the United States was manufacturing and selling the same articles nearly all over the world. They answered that they had not been aware of the fact. Many of the cassimeres are from France. Mexico is beginning to make cassimeres—very pretty imitations of the French article. Most all of the cotton goods sold in Mexico are manufactured at home, and the duty is very high. About the only cotton goods coming into this district from the United States are ducking and canvas. Linen goods come from England and France. American hats are very popular in Mexico, and are worn by the business men and residents of cities and towns. The rancheros still wear the Mexican broad-brimmed, pointed, high-crowned sombrero.

American shoes are very popular with the wealthier classes, who can afford to buy them, on account of their superiority in material style, and make. A large percentage of the people in this warm climate go barefooted, and some wear only sandals to protect the soles of the feet. The Mexican leather is injured in their process of tanning, and the shape of the shoes gives but little protection to the foot. A person would hesitate to kick, with a Mexican shoe on, almost as much as it he were barefooted. American shoes would have a better sale if more of

them were found in stock.

The tariff laws applying to shoes should be studied before putting goods on this market.

A. B. JONES, Consul.

TUXPAN, November 25, 1898.

## VERA CRUZ.

### COMMERCIAL DEVELOPMENT.

While the value of imports of Mexico has been increasing constantly in the last few years, a study of statistics reveals that the nature of the imports has entirely changed. A few years ago, almost every commodity for life and comfort could be found in the freight list of incoming steamers; but at the present day, a wonderful development of domestic industries, made possible by a high protective tariff, coupled with the advantages of very cheap labor, and the depreciation of silver, has taken place. The last decade has witnessed the erection of extensive manufacturing plants in almost every section of the country. The State of Vera Cruz has been particularly progressive, and its great wealth of water power is being utilized to operate a number of mills and factories, especially in the district of Orizaba, which has unrivaled climatic advantages. Extensive cotton and jute mills, utilizing over 10,000,000 pounds of raw cotton imported from the United States, breweries, ice factories, stamping mills, and a

number of other factories, principally owned and operated by the Orizaba Industrial Company, are working to their fullest capacity, and I

am informed that the output is not equal to the demand.

Under the management of Governor Dehesa, who is one of the most energetic officials of the Republic, I anticipate that in a few years, this State will produce a larger quantity of manufactured goods of various kinds. He has now opened what might be called a "special bureau of information," as will be seen by the following circular letter just issued:

> XALAPA, STATE OF VERA CRUZ, MEXICO, October 15, 1898.

Governor Teodoro A. Dehesa, of the State of Vera Cruz, Mexico, has within the past year established in Xalapa a special bureau of information, through which it is proposed to furnish such persons as may be interested any general or specific

information that may be desired respecting the State of Vera Cruz.

Among the States of the Mexican Republic, there is probably none more advantageously situated or more richly endowed by nature than the State of Vera Cruz. Possessed throughout its whole extent of a soil of surpassing fertility, and enjoying every variety of climate, from tropical in the low lands, changing gradually in the ascent of the slopes to suit the requirements or tastes of the individual, to a climate in the high altitudes visited in the winter by frost, localities may readily be chosen especially adapted to the most successful cultivation of any of the prodncts of the torrid and most of those of the temperate zones. Bordering for its whole length the Gulf of Mexico, and extending southward to the Isthmus of Tehuantepec, it occupies the territory through which the tide of travel and trade is destined to pass to and from the South American States. Well provided with railroads and, in the lower levels, with numerous navigable rivers, the producer finds easy access to the seaports of the Gulf coast and to Salina Cruz on the Pacific, while by different lines of railway, the interior of the country can be expelled and while, by different lines of railway, the interior of the country can be quickly and cheaply reached. The State is also well provided with water power, furnished by the numerous perennial mountain streams that descend to the coast. Abundant water power is obtainable for manufactories of any description or magnitude.

The State is developing rapidly, and is now about to receive fresh impetus through

the projection of several new lines of railway, and through the improvements to the harbors of Vera Cruz, Coatzacoalcos, and Salina Cruz. That of Vera Cruz is almost completed, vessels being now able to receive and discharge cargo from the city's

The design of the bureau is to furnish without charge, reliable information from official sources to any who may wish to acquaint themselves with the advantages offered by the State of Vera Cruz, with the view of investing in lands, engaging in agricultural or mechanical pursuits, opening channels of trade, or developing in any form the resources of the State, and also to advise those who may visit the State for such purposes.

Inquiries may be addressed to Alexander M. Gaw, special agent, Xalapa, State of

Vera Cruz, Mexico.

Despite the fact that the products of the local factories in some cases have not attained the same degree of excellence as similar American or European products, they are turned out at so low a cost of production that it is impossible for the foreign articles to compete, handicapped as they are with the import duties and comparatively high transportation charges from the seaboard to the inland markets, which leaves the domestic articles an unobstructed field. On the other hand, there are factories in Mexico whose products compare most favorably with kindred goods made abroad; for instance, the jute bags, such as are used in bagging raw centrifugal sugar, and other like substances. I believe they are superior to the Calcutta twills, Barcelona sacks, or any other I have ever seen. The price is a trifle higher than the Calcutta, but much cheaper than the Barcelona bags.

# COTTON GOODS

Common prints and low grades of cotton textiles from abroad are nearly excluded from the markets of Mexico, and will remain so, as long as the present schedule of duties is maintained. It is a fact

worthy of mention that whatever the cost of production may be (which I have not been able to ascertain), Mexican products are sold to the consumers in the United States at about the same price as the same class of goods are sold to the consumers here; hence, the profits to the manufacturers are much greater on account of cheap labor paid in cheap money. The only exception to this rule is where some foreign house is competing on some special article.

#### AMERICAN COAL.

It is gratifying indeed to report that the prejudice heretofore entertained against American coal is fast subsiding. Coal burners admit that it pays them better to use American than English coal, as whatever superiority may be claimed, justly or unjustly, for the latter is offset by the cheaper price of the former. The consumption of coal in Mexico, though increased of late years, still falls short of the possibilities as soon as certain adverse conditions can be remedied. Many districts accessible to the railroads still cling to the idea that it is cheaper to burn wood. The reasons given are, first, the scarcity of good stokers, and, second, the higher cost of coal. I have the authority of an expert engineer who, being entirely disinterested in the matter, says:

Considering the price of wood, with the exception of remote regions where the cost of hauling coal from the seaboard is very great, if a careful comparison is made of the results obtained from coal and wood for steaming purposes, the injustice of the discrimination against coal will at once appear.

The price of coal can be reduced very materially. In the port of Vera Cruz, the handling of coal is extremely slow and entirely inadequate to the requirements of modern shipping. One hundred tons per day is about the average discharge of a steamer during the season of "northers," from September to April. This is, of course, very slow work, and brings with it higher rates of ocean freights. There is no coal-handling machinery in the port. Ships discharge to lighters, and I am informed that it costs from \$1.25 to \$1.50 per ton of 1,000 kilos (2,200 pounds) to discharge the coal and put it on railroad cars. It is surprising that a modern coal yard has not been established here by the coal merchants of the States, as such an investment could but yield splendid results.

#### TOBACCO.

Notwithstanding the general decline in exportation during the war, Mexican leaf tobacco and cigars not only held their own but increased remarkably. The following figures will illustrate the difference in favor of Mexican exporters, viz: March quarter, \$25,652; June quarter, \$73,396; and September quarter, \$141,652 in leaf tobacco, and \$1,703, \$1,983, and \$3,257 in cigars. The gain to Mexico I would account as loss to Cuba. However, from the present indications, it appears that the tobacco trade has come to stay. It is the opinion of people who understand the art of cultivation and curing tobacco, that attention should be called to the excellent quality of Mexican tobacco to be used for wrappers, in competition with the Cuban product, which has heretofore held first place in the world's market. On account of the revolution in Cuba, large areas which were devoted to the planting of tobacco have produced nothing, and planters and laborers have migrated to Mexico in considerable numbers. These men are all enthusiastic over the richness of the Mexican soil, the abundance of water, the climate, and other favorable conditions they have found here.

The State of Vera Cruz appears to possess particularly favorable conditions for the raising of high grade tobacco, which, on account of its lightness, fineness, color, and flavor, is splendidly adapted for wrappers, and is, in consequence, commanding a good price in the markets. It is claimed that tobacco for wrappers of the very best quality, bringing as much as \$4 gold per pound, could be produced in these wellfavored regions, particularly in the high grounds near Ozumacin, which has water on both sides, and where the soil contains from 80 to 85 per cent of sand and from 5 to 6 per cent of white clay, the balance being decomposed vegetable matter. The last tobacco crop of the Uzumacin district and of the Nacional Valley averaged from 3 to 4 arrobas (75 to 100 pounds) per thousand plants, and was sold for from 80 cents to \$1 per pound. The total cost, including seeding, nursing, harvesting, curing, etc., and interest on the investment, was less than 15 cents per pound, which left a very handsome profit. On account of very favorable climatic conditions, the crop will be this year of an even better quality, and as there was no need of fresh seeding, it is calculated that the crop can be prepared for market at a cost not to exceed 12 cents per pound. When the plants are quite small, the buyers pay 80 cents per pound, but the planters believe that the real price should be \$1.20 when ready for shipment, about the end of February or the beginning of March.

It is calculated that the San Andres Tuxtla district will produce this year, 300,000 arrobas. Although inferior to the product of Oaxaca, this tobacco is of excellent quality. In that district it is calculated that a plantation of 75 acres, in which 1,000,000 tobacco plants can be cultivated, would give a crop worth \$62,000. Deducting the cost of planting, etc., at the rate of \$3 per arroba, there remains a net result of \$50,000 for tobacco alone, not counting the many by-products of great value, which a good planter would produce without materially increasing

his operating expenses.

#### THE HARBOR OF VERA CRUZ.

Since my last report on the harbor of Vera Cruz, the construction of the jetty has been progressing rapidly. The breakwater wall inclosing the bay and shutting off the northern channel is practically finished, affording a perfectly safe anchorage for vessels of deep draft. A new pier has also been finished, and is now being used by incoming steamers of various nations. The Ward Line (New York and Cuban Mail Steamship Company) has obtained a concession from the Federal Government to build a wharf. A good test of the effectiveness of the north breakwater wall was made on the 15th of October ultimo, when a most severe "norther" raged for twenty-four hours. All the ships in the harbor remained firm in their moorings, and a large steamer moored alongside of the new pier, and did not appear to be laboring at all.

Two substantial light houses have been dedicated to the marine

service by the Mexican Government.

### BAILBOADS PROJECTED.

From the monthly circular of the management of the steamboats plying on the rivers in the southern portion of the Vera Cruz, some interesting particulars about the railroad prospects in that wonderfully rich agricultural region are obtained.

The lease of the Tehuantepec Isthmus Railroad, which is the property of the Federal Government, to the Pearson Company is an accom-

plished fact, and the reconstruction of the entire line from the Gulf to the Pacific is to be undertaken in the near future. Under concessions from the Federal Government, the Pearsons are now building a branch line from Juile, a station on the Tehuantepec line, to San Juan Evangelista, the head of navigation on the San Juan River, and expect to have this line in full operation before the end of December next. From San Juan, two branches are contemplated, one to San Andres Tuxtla and the other to San Nicolas; the former will branch off from the latter at a point on the San Juan River near La Cera. Under the concession, the line may extend from San Nicolas to Tlacotalpam and Alvarado, but it is not yet settled whether the extension will be built, as the river furnishes ample transportation facilities. The Pearsons intend to construct and operate a complete system of transportation for the entire Gulf coast, and to carry out this intention are even now having surveys made to determine the advisability of building a railroad from Playa Vicente to Paso Nuevo, which would bring some of the richest Oaxaca districts into rapid communication with the coast.

Regarding Playa Vicente, it is learned from the same authority that during last month, a steamboat went up the Teseochacan River, the southern branch of the Papaloapan, to Playa Vicente, and entered the Mansa River, and then proceeded a whole day's journey up to the plantation of the Rio Mansa Company, a Scottish enterprise. This feat has been considered impossible of accomplishment heretofore, but will no doubt be repeated, to the great satisfaction of planters in that portion of Oaxaca. The plantation alluded to is capitalized for \$800,000, silver, and has 600,000 coffee trees, which yielded last year at the last picking, 2,000 sacks of coffee. It also contains a large quantity of rub-

ber trees and large pastures devoted to stock raising.

From this, it would seem that the Pearson management, in conjunction with the well-organized river steamboat company, intends to control transportation in the coast district. The combination will have a competitor, however, in the Vera Cruz and Pacific system, to be built under the concession obtained by A. B. Mason through a transfer of the old Read and Campbell concession, for the extension of the Mexican Southern from Oaxaca to the Isthmus. This line will start from or near Cordoba, on the Mexican Railroad, and will either absorb or run parallel to the "Agricola" line from Cordoba to Motzerongo, touch Tuxtepec, Oaxaca, where the Papaloapan will be crossed, and connect with the Isthmus line at Santa Lucrecia, about 40 kilometers from Juile. Engineers have been at work for some time, and it is said that construction will begin next month. As the main portion of the Pearson system will be completed within the next eighteen months, it will have a considerable start over its competitor, and may establish complete control over the Isthmus portion of the territory before the other can possibly reach it. At all events, the Vera Cruz coast and the Gulf side of the Isthmus will in a very short time be provided with excellent transportation facilities, which means that the lands in that section will rise rapidly in value.

#### AMERICAN COLONIES.

The vast territory lying between the Gulf and mountain range begins to attract the attention of the American farmers; a fair sprinkling of them are now at work, and from the best information I have it is no longer an experiment, but an accomplished fact that the results are flattering. One of these settlements, I am informed, has constructed a public highway to the shipping point for the transportation of their

products which is effected by means of American-manufactured wagons, quite a novelty in this State. Another of the settlers reports to me a sale of corn of \$400, Mexican currency, from 20 acres, and is confident his rice will pay him \$1,000 to \$1,200 from 10 acres of land. Another said:

Give me American labor-saving implements and American roads and wagons, and I quit the city and go to farming, because I know I can raise almost anything in this climate and have a good market to sell in; with the present Mexican system of transportation, I should never undertake it.

There is no doubt in my mind that it would be well to send United States wagons to this port. Several shipments of wheat from Mexico are recorded at Vera Cruz.

# LAND LAWS.

For such persons as may want to come to settle in Mexico the fol-

lowing in regard to foreign landholders may be of interest:

On the 11th of March, 1842, the President, Santa Anna, issued a decree under which foreigners were permitted to hold land in the Republic under certain restrictions as to residence (abolished by the law of the 28th of May, 1886), and others no longer existing. Article 10 of that decree, however, is as follows:

In the departments (States) which are not on the frontier, but which have coasts, the foreigner can only acquire country property (land) at 5 leagues distance from the coast.

On the 1st of February, 1856, the provisional president, Comonfort, issued a decree which prohibited foreigners from acquiring real estate in the frontier States or territories within 20 leagues of the boundary, without the previous permission of the supreme Government, and provides that foreigners who desire to obtain land within said limit must present a petition to the department of public improvements (Fomento), accompanied with a report of the governor of the State or territory in which the real estate is located.

It has been argued by very prominent lawyers of this country that the laws imposing said limits are no longer binding; that, in fact, they were abrogated by the Mexican constitution, which guarantees the "rights of man" to foreigners as well as to citizens. Blackstone defines those "rights" as follows: "The rights of man consist in the free use, disposal, and enjoyment of all his acquisitions, without any control or diminution, save only by the laws of the land." Judge Hall in his work on "The laws of Mexico," now out of print, quotes this definition in support of his contention that said laws are no longer applicable, but it seems to me that the saving clause is a distinctly dangerous one.

Then, it has also been argued that the Presidents named exceeded their powers in imposing the limitation in question, and that in any case, the Federal Government had no control over the subject-matter, which control was vested in the States. On the other hand, some eminent lawyers here contend that the limitations still apply; that they have not been, directly or indirectly, repealed by the constitution, and that they are countenanced by the principles of international law.

Article 6 of the public lands law of the 26th of March, 1894, after stating that every inhabitant of the Republic has the right to "denounce" national lands, goes on to say: "The privilege granted by this article does not repeal the restrictions (modifications) already established by the laws in force with regard to the acquisition by foreigners of real estate in the Republic." There are no other restrictions than those

referred to, in respect to foreigners holding real estate in this Republic;

consequently this article must refer to such restrictions.

Then there has been a ruling by the department of public improvements, on the point. The department was asked to advise "whether foreigners who wished to acquire mines within the frontier zone of 20 leagues, are obliged to petition for the corresponding permit, in accordance with the provisions of the law of the 1st of February, 1856." Minister Leal replied:

Foreigners are still obliged to solicit permits in accordance with the law as to foreigners, because such law, being of a special nature, can not be considered annulled by the new mining law, which is general in character and does not contain any provision which can be looked upon as expressly abolishing said requirements.

As no doubt a prudent foreigner will decide to recognize the decrees, it may be well to state that the modus operandi is as follows: As regards the frontier limit, the governor of the State in which the land is located is first approached by means of a petition to the department of fomento, supported by the testimonials of prominent people and a report of the Mexican consul as to the status of the applicant. The governor returns the papers to the applicant, at the same time signifying his approval or disapproval of the application. The papers are then handed to the department of public improvements (fomento), and after the department of foreign affairs has reported as to the matter, the application is granted or rejected by the minister of the former department. It may be stated that no respectable applicant has any difficulty in getting the desired permission, but the same is always personal; that is to say, it is never granted to corporations, but to individuals only. In case of corporations, the usual course is for the directors personally to apply for and obtain the permission. Of course, it is not necessary for the heirs of any individual who has secured the permission to likewise apply for it.

As regards the coast limits, the difficulties are greater, inasmuch as the permission of Congress is necessary in this case. The usual petition has to be presented, which should be supported by testimonials, etc., as to the character of the applicant, unless, indeed, he be well known. In this case, too, the application will be granted as a matter of course to a respectable applicant. It is important to remember that a colonization concession is a sufficient permission, and that colonists coming in thereunder are under no necessity to make the application referred to. Strangely enough, the decree as to the coast limits is often disregarded by foreigners, while that relating to the frontier is always recognized. There seems to be no good reason for thinking that if one is

valid the other is not. Both practically stand or fall together.

# PROMOTION OF UNITED STATES TRADE.

In concluding this report, I reiterate the suggestions contained in my last annual report, concerning the means of increasing our commerce:

1. Strictly adhere to the rules, regulations, and tariff laws.

2. Do not send inferior articles, unless the contract specially calls for them.

3. Do not send salesmen to Mexico who can not speak Spanish and are unwilling to conform to the modus operandi of Mexican dealers in buying, packing, shipping, etc.

The tables of imports and exports hereto attached will be of value

to Americans at large and merchants in particular.

WM. W. CANADA, Consul.

The total imports into this colony were \$1,422,097 during 1897. During 1896, they were \$1,462,637, and in both years, the proportion from the United States was some 55 per cent. This could be increased in many lines, if the colony were visited more frequently by the American "drummer."

The mail steamers from New Orleans are now under the British and Norwegian flags, and there has not been an American vessel at this port since May 13, 1898; but the *Breakwater* and *Stillwater* will resume run-

ning when no longer needed by the Government, and these two vessels will again display the flag of the United States in Central American waters.

The future progress of this colony will depend upon the building of railroads, thus opening the back country, and the renewal and improvement of the mahogany and logwood trade, for so many years the chief industry of British Honduras. That there should be any argument against a railroad is indeed strange, but until all can agree as to route and terminals, conflicting interests and opinions will delay the construction, as they have in the past.

The American contractor has been in evidence here during the past year. An iron bridge, which has been built over the Belize River, a new post-office building, now nearly completed, and a large church-school, well under way, represent United States enterprise, and more will follow

in the near future.

W. L. AVERY, Consul.

BELIZE, July 12, 1898.

Declared exports from Belize to the United States during the year ended June 30, 1898.

#### COSTA RICA.

I transmit herewith a detailed tabulated statement of all the articles imported into Costa Rica during the year 1896, from the United States, Great Britain, France, and Germany.

More than 93 per cent in weight, and more than 85 per cent in value of all articles imported into Costa Rica, come from the four countries named above.

I have thought this information would be of much value to the manufacturers and merchants of the United States, as it shows (1) the extent of the market, (2) from what countries this market is supplied, and (3) the relative price at which these articles are furnished by our principal commercial rivals.

The commercial statistics for 1897 have not yet been published.

JOHN C. CALDWELL, Consul.

SAN JOSE, October 23, 1898.

Total importations into Costa Rica from the United States, Great Britain, France, and Germany for the year 1896.

#### SUPPLEMENTARY REPORT.

I transmit such information as I have been able to obtain of the imports of Costa Rica for the year 1897, and exports for the first six months of 1898.

#### IMPORTS FOR 1897.

The total value of imports was \$4,576,446, of which 33.64 per cent came from the United States, an increase of 0.66 per cent over the year 1896. A full list of the importations for 1897 has not yet been published.

Exports in first six months of 1898, compared with the same period of 1897.

	1897.	1898.
Coffee:

Kilograms	27, 400, 966	34, 414, 609
KilogramsPounds	60, 408, 170	75, 870, 447
Various exports:	11, 11, 11, 11, 11, 11, 11, 11, 11, 11,	,,
Kilograms	3, 717, 499	2, 945, 834
Pounds	8, 195, 597	6, 494, 386

The entire export of coffee for the year 1898 is estimated at 18,500,000 kilograms (40,785,100 pounds), which, as will appear from the following table of exports for the last sixteen years, is the largest crop ever raised in this country:

Years.	Kilograms.	Pounds.	Years.	Kilograms.	Pounds.
1883	16, 629, 521 9, 150, 897 9, 037, 050 13, 081, 921 10, 313, 082	20, 288, 330 30, 661, 442 20, 174, 068 19, 923, 060 28, 840, 403 22, 736, 221 28, 544, 294 33, 938, 913	1891 1892 1893 1894 1896 1896 1897 1898 (first half)	11, 442, 041 10, 776, 763 11, 089, 523 11, 715, 801 13, 871, 363	81, 177, 870 28, 805, 350 25, 225, 124 28, 758, 452 24, 447, 962 25, 828, 655 30, 580, 807 38, 545, 218

The crop of 1899, on account of excessive rain, will, it is believed, be the smallest for many years.

The rate of exchange has steadily increased, until it has now reached

200 per cent.

JOHN C. CALDWELL, Consul.

SAN JOSE, November 16, 1898.

## GUATEMALA.

During the year 1897, the commerce of this Republic fell far below that of 1896. A combination of causes led up to this. Extraordinary expenses had been incurred; the Central American Exposition (an unfortunate venture) cost enormously in cash, entailed a bonded indebtedness of \$1,000,000 and gave no returns. The receipts fell far short of paying running expenses. Public buildings and improvements on a magnificent scale were undertaken, and while these will for all time redound to the credit of Guatemala, and are monuments of beauty and utility, it is most unfortunate that the time of payment should have come just when the country was in extreme financial difficulties. fall in the price of coffee was one of the most potent causes of the distressingly hard times, for in this industry the wealth and labor of the country are employed, and from its export the Government has derived a great revenue. There was a lack of public confidence, money became scarce, the banks were embarrassed and their transactions as limited as possible, merchants dared not make ventures, and it may almost be said that for the greater part of the year, business was practically suspended. The cessation of work on the Northern Railroad and the inability of the contractors to get pay for work done created a vast amount of trouble, and caused actual distress to the subcontractors and employees.

During the first part of the year, ominous signs of political troubles portended the revolution which culminated in September, and for the

balance of the year, trade and commerce were paralyzed.

At the present time, predictions of better times are freely made. The Government is making wise and energetic efforts to relieve the situation by economy in all departments of the public service, by enacting laws tending to the development of the agricultural resources of the country, and to the more equal distribution of the burden of taxation among all classes.

The United States has steadily maintained and increased her lead in imports, and in some important lines, her gain has been most gratifying,

as I will show later on in this report.

### AGRICULTURE.

Guatemala has an almost perfect climate, is well watered, and extremely rich in natural resources; but because of its moun ainous character and the peculiar characteristics of the people, its agricultural resources remain practically undeveloped, except in the one branch of coffee raising. The varying degrees of altitude and temperature are remarkable. From the two belts of the "tierra calientes" on the Atlantic and Pacific coasts, where all tropical vegetation is most exuberant, to the "tierra frio," 10,000 feet above the sea, where severe frosts are experienced, the country is jagged and broken by volcanic action.

There are no plateaus of any great extent, but many valleys, all enormously productive, and foothills, also extremely fertile. As the roads from these valleys are difficult mountain trails, produce has to be transported by pack mules or by the Indians, and when the distance to market is great, this is not profitable. The Indians, who constitute the laboring class, are an idle and unambitious people. Bounteous nature in this favored clime supplies them with food and clothing, and exacts but little labor in return. With this, they are content, and therefore independent. Hence, the labor problem is a serious one, and as coffee raising has been by far the most profitable branch of agriculture, all the available labor has been employed in it. The Indians, who prefer to make a poor living by independent production rather than a better one by fair wages, supply the markets with its fruits and

vegetables.

Until the past year, the cultivation of coffee has given enormous profits and stimulated investments in coffee lands, until most of the best lands have been developed, or are held at very high prices. The principal districts of the coffee-growing industry are found in the departments of Quezalenango, San Marcos, Chimaltenango, Santa Rosa, Retalhuleu, Escuintla, Zacapa, and Alta Verapaz. In these districts are found the conditions essential—an elevation of from 2,500 to 4,500 feet above sea level, and great depth of virgin vegetable soil. So profitable has been this industry for ten years past, that large fortunes have been made, and a condition inaugurated closely resembling that in the oil regions of the United States after the first discoveries. Finqueros seem to have gone mad with their prosperity, and have indulged in the utmost extravagance and luxury. A few weeks or mouths on their fincas, and the balance of the year in Europe or in travel, seems to have been the rule. The result has been (I am speaking generally, of course) that magnificent incomes have been used up, and even anticipated by loans, and now that the price of coffee has gone so low, and Guatemala is struggling with the hardest times she has ever seen, the financial difficulties of the finqueros are as marked as those of all other classes.

There is another condition that should be noticed. During the prosperous times, many people undertook the development of coffee fincas largely upon borrowed capital, and as the prevailing rate of interest here is 1 per cent to 1½ per cent per month, they are not now able to pay unless they have an especially good piece of land and personally manage their estate upon economical and correct methods, and many

fincas have been and will be sold under mortgages.

The coffee from the high and humid districts of Coban and Retalhuleu, and perhaps some of the other districts of Guatemala, is the highest grade of mild coffee; is always in demand, and will always command the highest prices in the markets of the world. It is known that the districts of the world where superior mild coffee can be raised are limited. In Java, where much of this class of coffee comes from, the lands are worn out in the older sections, and the yield has grown materially less with succeeding years. Every expedient has been resorted to to renew them, but I am informed that no fertilizer has yet been discovered which will fully restore to the land the peculiar qualities it requires for the growth of coffee. The oldest coffee districts of the world have been entirely abandoned, for this reason. Brazilian coffee is strong and heavy. It is the opinion of experts that the price of Guatemalan coffee will not go lower, and there may be a rise of 40 or 50 per cent in the next four or five years. I am inclined to this belief, because

investigation shows that there has been an ebb and flow in coffee prices in time periods of from five to seven years. It is now certainly at the ebb. The last cycle of high prices of these coffees lasted from November, 1886, to about May, 1897.

I am firmly convinced that coffee raising will continue to be a highly profitable industry in this country to those who own the best lands in the best districts. There is no such thing as cheap coffee land here now; that is, lands that are peculiarly suited for its cultivation. Any one coming to Guatemala and buying cheap land will meet with failure.

One caballeria (120 acres) of the fine land of the Retalhuleu district will give, one year with another, at least 1,800 quintals (a quintal is 100 pounds) of coffee of fine mild grade, and at the lowest price for which it has been sold on the finca—say 20 cents per pound, silver, or 8 cents, gold, with exchange at 150 per cent—would give \$36,000, silver, or \$14,400, gold, per caballeria. The cost of raising—that is, keeping land clean, harvesting, and cleaning—will not exceed one-half this selling price. Coffee crops in this country, especially in this district, never fail; but every other year's crop is better—that is, one year the place would probably give 2,100 quintals and the next 1,500 quintals. The crop, however, never fails, at least it has not failed in this district for thirty years.

It takes about three years to bring land into condition for bearing. The cost of clearing, planting, and keeping clean each caballeria for three years would be about \$15,000 silver. The fourth year one would have about half a crop, and from the fifth year on, average crops would be obtained. From the sixth to the twelfth year, such land as I have mentioned would give an average yield of perhaps 2,000 quintals per year; but the average from the fourth year to the eighteenth or twen-

tieth would be about 1,800 quintals per caballeria.

During the next year or so, the hard times will force much of this land into the market, and for a young man with capital and capacity

for affairs, there will be golden opportunities.

The cost of producing coffee in this country varies not only in the different zones (regions), but also from plantation to plantation, depending as it does on the quality of the soil, the height above sea level, the age of the plantation, and the facilities to secure sufficient labor.

The average cost price ranges between 10 and 15 pesos (\$4.40 to \$6.60) per quintal (100 pounds), without counting interest on the capital

invested, as in this item all planters are differently placed.

During the past few years, speculation in coffee plantations went so far and such fabulous prices were given for these lands, that interest is

now an overcharge against the price of production.

The value of coffee, free on board, was from 21 to 25 pesos (\$9.24 to \$11), the export duty this year being from \$3.40 to \$4.10 a quintal. This variation is on account of the difference in the price of exchange, as one-half of the duties is payable in English gold or its equivalent. Even these prices allow a fair margin of profit; but only a few of the growers have been able to avail themselves of the opportunity. Unfortunately for the great majority, they have been forced by their contracts to ship their coffee abroad for sale at ruinously low prices in gold.

The poor market for the grain and the low price abroad, combined with high commissions and capitalization of interests, have brought, as a natural consequence, very small payments to foreign creditors this year. This, with the bad prospects for coffee for the coming season, has caused the refusal on the part of foreign creditors to renew the

annual loan of money in order to raise the crop.

If the growers do not get the money abroad, it will be impossible for them to obtain it at home, on account of unsettled conditions of business, and if sufficient funds are not secured in time, they will lose the coming crop, which is expected to be a heavy one. Of course, the fear of losing all may force creditors to advance enough sums to harvest the coming crop. On this hangs the success of the season.

The reduction of the export duty to 1 peso (44 cents) in currency per quintal will be of great benefit to the producers, as the whole saving, over a million and a half dollars in this money, will go to them.

Taking everything into consideration, the export for 1898-99 should amount to 50,000,000 pounds, more or less, but naturally, the advantage will be all with the creditors, as the growers owe already the full value of this crop

In Guatemala, as in Brazil, and all other coffee-producing countries, the cost of production must be brought to a much lower level to conform with the lower prices now in force. With greater care in the selection of ground and economy in working, the cost of production can be very much reduced. Above and beyond all, a decided reduction in the price of labor is required; not so much in the wage of the day laborers, as in the enormous first cost of obtaining them, in the way of presents to petty officials and other similar methods. Salaries of employees must also come down in proportion. Commissions and interest must be reduced to a minimum figure, and the plantations considered as something else than a gambling scheme, or a means to produce a fortune in a few months without work.

It is patent to all observers that before very long, a considerable proportion of the plantations will have to be abandoned on account of unfavorable conditions of soil and climate, which preclude working at a profit. This once done, interest will naturally come down, the possibility of speculation being eliminated.

If the Government of this Republic does not wish the industry to be ruined a great change in agrarian legislation must take place; more protection must be given, and the abuses connected with the securing of labor rooted out, for laborers are now protected in every case by local and department authorities to the prejudice of the employer.

When these difficult and painful evolutions are over Guatamala will perhaps export less coffee, but it will doubtless be of better quality, and the cost of production will be much less—conditions favorable to

the merchant as well as to the producer of the grain.

Cacao and rubber.—These are indigenous to Guatemala, and can be grown throughout the tierra calientes or hot lands of the coast. former years, considerable rubber was exported, taken from wild trees, but the destructive methods employed by the Indians in gathering it soon destroyed the trees, and but little is now obtained. The efforts being made by the Government to stimulate such industries will cause more attention to be paid to this, and the production will increase. There is considerable available land which can be secured very cheaply. It is useless to attempt cultivation at an elevation of more than 500 feet above sea level; it has been attempted here, and while the trees grew and flourished, they yielded no sap and were entirely unprofitable. Low, moist land is requisite, and in the tropics, such land is always more or less unhealthy Pernicious fever is usually prevalent, and to a white man it is deadly. The tree takes about seven years to mature, and is thereafter very profitable, at present prices. The land is cheap, but clearing and planting is expensive. Where the rubber tree grows is usually found a heavy forest of logwood, mahogany, ebony, and other

tropical trees of enormous size, and a tangle of shrubs and vines. My opinion is that in these cheap lands, it would prove more advantageous simply to clear out the underbrush and smaller trees and plant the rubber seedlings in all the available spaces, rather than attempt clearing and planting an entire grove of rubber trees. Considerable cacao is grown, but none exported, the home market consuming it all at good prices.

Sugar.—The rich volcanic soil of the valleys of Guatemala is especially suited for the cultivation of sugar cane, and there are many extensive plantations scattered throughout the country. The Central Railroad is lined with them. The consumption of sugar in this Republic is enormous, and the home demand has been sufficient to make the business a profitable one. Recently, however, the price has fallen owing to overproduction, and for the first time, an effort has been made to export it. The Pacific Mail has made a \$4 per ton rate on quantities sufficient to load a steamer, and considerable has been sent to San Francisco. Should it prove that sugar can be successfully exported, it will create an enormous industry here.

Fruits.—Tropical and subtropical fruits flourish throughout the country, but none are exported except the banana. I believe that the country in the vicinity of El Rancho de San Augustine, the present terminus of the Northern Railroad, is well suited for growing oranges and grape fruit, and as the port is but 800 miles from New Orleans, it would seem to me that they could be profitably exported to the United States. From the district a little nearer the coast \$77,500 worth of

bananas was sent to New Orleans last year.

Other products.—A good quality of tobacco is raised in the eastern districts, where about 2,500 acres are under cultivation. This is proving profitable, and more attention will be given to it in the future. In the high lands, wheat, barley, oats, and potatoes are grown, but not nearly enough to supply home consumption, and large quantities are imported. Peruvian bark, vanilla, and sarsaparilla are produced and exported in small quantities. But these industries are dormant, awaiting capital and enterprise to develop them. The climate and soil of portions of Guatemala are well suited for the cultivation of ramie and other fiber plants, as I pointed out in my report to the Department on the 15th of April last.<sup>1</sup>

#### FINANCE.

The national revenues for 1897 amounted to \$12,479,742 silver, a decrease from the income realized the previous year of \$2,671,000. To a large extent, this loss was in import dues, attributed by the Government to the admission of many articles duty free during the time of the Central American Exposition; but without doubt, the depreciation of silver and rise in exchange, the fall in the value of coffee, lessening the power of the people to purchase, the revolutionary movements and lack of confidence in the stability of the Government, had much to do with it.

The assets and liabilities of the Republic are given by the minister of hacienda in his memoria recently issued, as follows:

The lack of confidence in the financial situation was greatly increased by the Government issuing a decree in May, suspending the redemption of the then outstanding bank bills in silver. Exchange rose rapidly, and frequently, the merchants who wished to make remittances were totally unable to buy from the banks at any price. It was found that the banks, as a rule, with one exception, had decreased their silver reserve, and having large outstanding paper circulation, were naturally in a very precarious condition. Their danger was greatly augmented by the fall in the price of coffee and the resulting reduction in the value of the plantations, for the planters and merchants who had obtained advances upon shipments of coffee were unable to meet their obligations. It was these banks, in the main, who had made the large loans to the coffee planters secured by mortgages upon their estates, which I have mentioned under the heading of agriculture. These loans in prosperous times, with rates of interest at 12 to 18 per cent per annum, yielded great dividends, and bank stock commanded phenomenal values, but this ruinous system has not only brought bankruptcy to many planters, but, has also as a logical sequence, deeply involved and compromised the banks.

The exigencies of the Government have compelled large loans from the banks, distributed as follows:

The International Agricola Hipoticario Bank of Guatemala Occidente	800, 000 1, 000, 000 600, 000
Americano	

The value of bank stock has depreciated enormously, certainly more than 50 per cent, although forced sales are about the only criterion. Exception might be made of the Americano, whose stock has been in demand at about \$700 per share of \$1,000 nominal, \$600 paid up.

The Banco de Occidente has lately suspended, but, as its assets are largely in excess of its liabilities, it will probably resume. The Government has aided it by a decree requiring that taxes and sums due the Government must be paid in Occidente bills. This measure will keep so much of that bank's paper in circulation that it will be impossible to make a raid on it, until it can retire sufficient of its bills to enable it to meet all that may be presented for redemption in silver.

The great problem confronting the Government is the commercial and financial situation of the country. The National Assembly recently appointed a special committee on finance, and the result of their deliberations is embodied in a report, from which I have taken the following:

The committee, in the first place, drew a comparison between the two periods of 1886 to 1892, and 1892 to 1897. On the 15th of March, 1892, the consolidated debt of the Republic amounted to (gold) \$10,890,895. To day it amounts to \$7,537,400; being a diminution of \$3,353,495.

This arises principally from the discharge or reduction made under the arrangement with the foreign bondholders, which amounted to \$3,267,658. What has really been paid off from this debt is \$426,600 gold, which, reckoning exchange at the rate of 150 per cent, equals

\$1,156,500 silver.

The unconsolidated debts amounted on December 31, 1897, to \$21,341,925 silver. On March 15, 1892, they were \$6,485,872, less \$1,156,500 paid on the consolidated debt, leaving an increase of debt during the six years from 1892 to 1897, of \$13,699,553. If to this is added the product of the national revenue during the same six years, we will have:

1893 1894 1896 1896	**************************************
Total revenues	
Total	

This was absorbed in the six years from 1892 to 1897, in the expenses of the public administration and interest on debt.

Making a similar computation for the six previous years, 1886 to 1891, we have:

External debt, gold, December 31, 1885	\$4, 210, 000 4, 546, 500
Increase, gold	345, 500
Internal debt, silver, December 31, 1885	6, 442, 462 .12, 830, 268
Increase	
Increase of external gold debt, \$345,500, at 150 per cent exchange	15, 969, 513 863, 750

Total increase of debt from 1885 to 1892, in silver	16, 833, 26	3
1886	\$3, 669, 64	17
1887		
1888		
1889	6, 152, 80	00
1889	7, 309, 14	12
1891	8, 683, 53	36
	52, 175, 39	- 92
Six years, 1892 to 1897	86, 755, 96	38
Increase in expenditure from 1892 to 1897	34, 580, 56	 59

Or, roughly estimated, \$5,763,500 of increase each year.

This increase in expenditure has helped to aggravate the crises brought about by the recent fall in the price of the only considerable article of export, and the situation has now become disastrous.

The average rate of exchange for the year 1897 was 165 per cent premium, for sight drafts on New York.

#### COMMERCE.

The United States, Germany, and Great Britain have practically controlled the foreign trade of Guatemala, and for the past four years, the total imports have been supplied by these nations in the following proportions: In 1894, the United States, 26 per cent; Germany, 13 per cent; Great Britain, 24 per cent. In 1895, the United States, 36 per cent; Great Britain, 21 per cent; Germany, 23 per cent. In 1896, the United States, 34 per cent; Great Britain, 23 per cent; Germany, 22 per cent. In 1897, the United States, 33 per cent; Great Britain, 21 per cent; Germany, 21 per cent.

There are no manufactories in this Republic, although the Indians in the department of Quezaltenango weave in a most primitive manner fabrics of cotton, which form the dresses of the women of the lower class. Sometimes, this cloth is partly silk, of artistic design and brilliant colors. Oigars and cigarettes are also manufactured, as well as common soap, but there are no manufactories run by steam or water

power, and practically all manufactured goods are imported.

The following table, compiled from the memoria of the minister of hacienda, shows the distribution of Guatemala's trade for the years 1896 and 1897:

Cotton goods, cloth and thread, are far the most important in point of value, and Great Britain has ever maintained first place, Germany occupying second, and the United States third. In 1894, Great Britain's share of this line was 73 per cent of the whole, Germany's 17 per cent, and the United States 6 per cent. In 1895, the ratio stood: Great Britain, 57 per cent; Germany, 21 per cent, and the United States 8 per cent. In 1896, Great Britain had 58 per cent, Germany 14 per cent, and the United States 10 per cent. In 1897, Great Britain had 58 per cent, Germany 18 per cent, and the United States 15 per cent, showing a continuous gain for us. A little more attention to the designs and bright colors required by this market and personal attention by traveling men who speak Spanish, and our rank can be easily raised.

In woolen goods and silk, our trade is very small, Germany standing

first in the former and France in the latter.

Hardware, iron, and steel in all its forms, agricultural implements, machinery, electric-light fixtures, glass, paints, oils, etc., are largely used, and the United States has a fair share of this trade.

Galvanized corrugated sheet iron is quite extensively sold, but our manufacturers have paid little attention to this branch, and most of it

comes from Great Britain.

Galvanized barbed fence wire is in demand, most of it coming from the United States and Germany; more from the latter country than seems warranted by our capacity to produce it. Freight from San

Francisco is about \$10 per ton.

This will never be a good market for agricultural machinery, on account of the mountainous character of the country; but such farm tools as hoes, axes, picks, shovels, machetes, and forks are used in large quantities. Hoes have the greatest sale, because they are used on coffee fincas in clearing the land of brush and weeds. They should be large, of the finest steel, and have a round eye for the handle. The axes must also have round eyes, instead of the oval form used in the United States. The latter does not sell well here, for the Indian insists on making his own helve. These articles, as well as machetes, should be especially made for this trade. Hunting knives in ornamental sheaths sell extensively.

The United States supplies most of the builders' hardware, but there

is not a great demand for it at this time.

The manufacture of sugar is assuming large proportions, and there is and will be a good market for the requisite machinery. This can also

be said of machinery for preparing coffee.

Almost everything in the line of groceries comes from the United States. There is a large sale for canned goods—vegetables, meats, and preserves. Condensed milk and evaporated cream are increasing in demand.

In general, it may be said that the bulk of United States goods is too good for this market. They should be made to sell cheaply, but should be showy with colors and tinsel. Most of the granite ware comes from Germany, because of the low price; but it is so light and cheap that it can not last long.

The total exports in 1897 were \$19,775,860, made up substantially of three items, viz: Coffee, \$18,875,700; bananas, \$77,500; hides, \$205,193. The bananas went entirely to the United States, and more than half of

the hides to the same country.

As I have previously reported, the coffee crop this year is larger than last year, but the price has been far lower, and \$3,473,923 less was realized than in 1896.

# Amount of coffee exported and countries of destination in 1896 and 1897.

Countries.	1897.	1896.
United States	Quintals. 137, 055 543, 806	Quintals 119, 624 442, 680
England	123 277	103, 328 22, 102
Total	824, 754	687, 734

The quintal equals about 100 pounds.

I give below a table showing the amounts of customs duties collected for the years 1896 and 1897:

	1897.	1896.
Guatemala City.	\$2, 624, 244	\$4, 519, 860

Total	6, 810, 124	8, 984, 413

#### TRADE-MARKS AND PATENTS.

# The laws of this country provide:

The manufacturers of countries with which the Republic has in force conventions upon the subject, may register their marks. \* \* In order that foreign marks may enjoy the guaranties that this law affords, they must be registered in conformity with the respective treaties.

# And as to patents:

All citizens of Guatemala, or foreigners that have a year of domicile in the country, may obtain patents \* \* \* in all cases where there are treaties that permit this.

There is at present no treaty or convention existing between the United States and Guatemala concerning these matters, and therefore, our citizens can not register their trade-marks or obtain patents for their inventions.

## RAILROADS AND STEAMSHIP LINES.

The Northern Railroad, from Puerto Barrios to Guatemala City, will have an extension of 195 miles, of which 133 are already completed and in operation. When this road is finished, it will connect with the Central at this capital and form a transcontinental line from the Atlantic to the Pacific Ocean, carrying goods without transshipment. At present all work of construction is suspended, and owing to the financial difficulties of the country, will probably not be resumed by the Government. The National Assembly has authorized the President to sell or lease the road upon such terms as will insure its completion at an early date. The use of this road will necessarily reduce freight on both exports and imports, as Puerto Barrios, the Atlantic terminus, is connected with New Orleans, Mobile, New York, and European ports by several lines of steamers. The New Orleans, Belize and Royal Mail

Steamship Company, owned by Macheca Brothers, of New Orleans, is the principal line, and has a monopoly of the fruit trade on that coast of the Republic. Its steamers make weekly trips from New Orleans to Puerto Cortez, Honduras, touching at Puerto Barrios and Livingston, in Guatemala.

On the Pacific side, there are two regular lines of steamers touching at the ports of San José, Champerico, and Ocós. First, the Pacific Mail, which runs between San Francisco and Panama. There are five regular steamers per month on this line, and extra steamers run whenever there is an accumulation of coffee. The bulk of the coffee is shipped to Europe or New York via the Isthmus of Panama. The rate of freight from this Republic to London, Hamburg, New York, or San Francisco, is about \$18.50. The sea freight on merchandise from San Francisco or Europe is about \$10; wharfage about \$3.50; agency right, \$3.50; freight on Central Railroad, \$8; total to city of Guatemala, about \$24.

The Cosmos Line of Hamburg runs a steamer once a month around Cape Horn. The freight rate on coffee is about \$18.50 to either London or Hamburg; the rate on merchandise from Hamburg is about the same as that charged by the Pacific Mail. This line is a formidable com-

petitor of the Pacific Mail for the coffee trade.

The subvention recently given by this Republic to the Compania Sud America de Vapores and the Pacific Steam Navigation Company, which I reported in April last, will influence foreign commerce. It is an effort on the part of Chile to secure a share of the trade of Central America, her products being almost the same as those shipped from the United States. The Chilean Government gives a subsidy of \$50,000 and Guatemala gives \$15,000 per year. The steamers are to run as far north as Ocós, Guatemala, and must touch at Guatemalan ports at least once a week.

The Guatemala Central Railroad, from Guatemala City to the port of San José on the Pacific, a distance of 75 miles, is controlled by American capital, and has been a very successful and profitable enterprise. It is ably managed, and practically all of the employees in the operating department are citizens of the United States. The rate of freight on imports averages \$8 per ton, gold, while passenger rates are 8 cents per mile, first class, and 4 cents per mile, second class, Guatemala currency.<sup>2</sup>

A. M. BEAUPRÉ, Consul-General.

GUATEMALA, May 28, 1898.

<sup>&</sup>lt;sup>1</sup>See Advance Sheets, No. 93, April 21; Consular Reports, No. 213, June, 1898.

<sup>2</sup>The value of the Central American peso was estimated by the United States Director of the Mint, January 1, 1899, at 43.9 cents.

#### DECLARED EXPORTS-GUATEMALA.

#### HONDURAS.1

The exports from this consular district for the six months ending June 30, 1898, were as follows:

Cocoanuts	11, 883. 56 9, 363. 54
Total	43 312 98

I am unable to state whether there is an increase in exports, as no record of the exports has been kept in this office by former consuls.

The imports are very hard to determine, as the custom-house statements do not present them in an available form. I have sought other sources for information, and would estimate them at \$50,000, of which about \$40,000 worth comes from the United States.

The imports consist of meats (canned and salted), cotton goods, woolen goods, boots and shoes, hardware, lumber, hats, caps, flour, corn meal, crackers, canned fruits, canned oysters and fish, lumber

(hard pine), furniture, woodenware, coal oil, sugar, butter, cheese, can-

dles, lamps, glassware, rope, and notions in general.

All goods should be packed in as light packages as possible, as the tariff is levied by the gross weight, and in some instances, the duty on the packages is more than the cost of the goods. Oatmeal, corn meal, and cereals put up for table use should be in air-tight packages, as in this climate they soon spoil, and are a loss to the merchant. Especially is this true of oatmeal and corn meal. If corn meal could be put in 5 to 10 pound tin cans, air-tight, so that it would keep, the trade would be materially increased; as it is, but little is used. In regard to candles, there are none sold from the United States, for the reason that they run together and are a loss to the merchant, while those from England, put up in tin cans, keep well. There would be a good trade in this line if the goods were properly packed.

A considerable quantity of goods comes to this country via Belize, British Honduras, on account of the better condition of transportation, there being a regular mail line each week. If a similar line could be established from New Orleans, via Utilla and Ceiba, it would increase the trade with this district. Merchants now order their goods via Belize, British Honduras, and as there are English houses represented there, they buy more or less goods of them; while if they could order direct and know when the goods would arrive, they would purchase in the United States. As it is, sometimes two or three weeks pass and not a

ship arrives from the United States.

If an agency or bonded warehouse were opened, where merchants could order from samples, it would benefit our trade. There are several articles which are sold here—for instance, thread, lace insertion, etc.—in which the English have all the trade. In cotton goods, some English lines are sold, but the majority is American. The finer grades and best qualities are chiefly used. The heavier grades are not sold in shirtings. The cottons used for sails and tickings are all American. This market will use twice as much of a first-class as of an inferior article. On the island of Utilla, where the English and not the Spanish language is used in the schools, books from the United States, if introduced, would be exclusively used.

The best qualities of all classes of goods sell here, and those from the United States lead, except in the line of woolen goods, which are chiefly of English manufacture. Fine light goods, to be used for trouserings, etc., are in demand; those heavy in weight are not used, the thick cot-

tons taking their place.

The finish and style of all American goods are first-class, and attract the customer's attention. American whisky is always used when it can be had, and our beer is sold, so far as I have seen, to the exclusion of all others.

Pickles of all kinds should be in bottles and attractively labeled. Those sold here are put up in England. Cornstarch should be prepared in 2-ounce packages; that sold is English, and is labeled corn flour.

# CURRENCY, TARIFF, ETC.

The currency used is the silver peso or sol, and it is now worth 43 cents, but all business transactions are on the gold basis. All values are fixed on the gold standard, and United States money is held to have the same value as gold.

There are no rates of exchange, as there are no banks. The fruit steamers draw sight drafts on their firms in New Orleans. The great

drawback to trade is the tariff. While the published rates are so much a pound, there are additional charges which make the tariff about double. For instance, a party bought  $2\frac{1}{2}$  kegs of nails in the States. When the duty was paid, they cost 28 pesos, or \$11.20 gold. Another party brought from the United States \$78 worth of furniture, the duties per published rates being 26.32 pesos; 5.04 pesos were charged for weight, plus 30 per cent, plus 20 per cent, plus \$10.50 for paper at custom-house, making the total 59.42 pesos, or \$23.76 gold.

The railroad syndicate has stopped operations, and whether it will

recommence is not known.

There is no license charged for carrying on business, and no taxes are levied except on personal property for municipal roads and schools. Land is not taxed.

The quarantine laws are rigidly enforced against all alike. Any commandant may send a vessel into quarantine, where it will be held

for fifteen days.

There is no merchant marine in this country. The vessels are small schooners and sloops, which do a coasting trade; none of them are larger than 75 or 100 tons.

Commercial travelers can go and come without license, but have to

have their samples pass through the custom-house.

There are no laws requiring goods to be marked to show country of

origin.

The exports from this country are wholly to the United States, and, so far as I can learn, no other country receives any of the tropical fruits. Some of the finer timber may be exported to other countries, but

from the east coast and Bay Islands, it all goes to the United States.

There are no agricultural implements of any kind used, except the

machete, which is manufactured in the United States.

BENJAMIN JOHNSTON, Consul.

UTILLA, October 1, 1898

#### SUPPLEMENTARY REPORT.

Trade for the month of October has been satisfactory; the movement of cocoanuts has been large and prices firm. The supply is greater than the demand, but holders of cocoanuts are holding for better prices.

A recent storm has done great damage to banana, plantain, and cocoanut trees. The bananas are ruined for the present, and it will be one or two months before fruit can be cut again. The same is true of plantains, and 15 or 20 per cent of the cocoanut trees have been blown down, which will have a material effect on the supply of nuts. The storm was the heaviest ever known, and lasted for about three weeks. Nearly all the sloops and schooners in the bay went ashore, but only one was lost. Four steamers sought refuge in this bay until the storm was ended and were not damaged.

BENJAMIN JOHNSTON, Consul.

UTILLA, November 1, 1898.

#### DECLARED EXPORTS-HONDURAS.

Declared value of exports from Honduras to the United States during the four quarters of the year ended June 30, 1898.

## NICARAGUA.

#### MANAGUA.

I have been unable as yet to collect the statistics of exports and imports up to June 30, 1898, owing to the fact that the bureau of statistics of this Government was closed in 1897, after the statistics for 1896 were prepared. The bureau was suppressed for economical reasons. I hope to be able to obtain them at a later date. I am able to state, however, that, owing to bad crops, low silver, and the revolutions, the business now done in this country is less than half that of 1896. The present imports and exports can be calculated by dividing the figures herein given for 1896 by two. This may serve to give an idea of the value of Nicaraguan trade, and of what classes of goods are bought. Coffee has been the greatest article of export for the last two years; the present crop is very light. Rubber, for the same period, has been almost nothing, owing to a law enacted in 1897 forbidding the cutting of rubber for ten years on all lands belonging to the Government, which leaves very little. However, many planters are now putting in rubber trees as shade for their coffee, and also planting rubber on low lands and river bottoms, where coffee does not flourish. In a few years, the crop will be greatly increased and will not be subject to the abovementioned law. With the decrease of crops and exports, silver has been shipped out of the country, exchange has risen to 200 per cent premium and higher, and the country has been flooded with paper money—Government notes—which are very difficult to use as a medium of business. The financial crisis here is very severe, and the only hope

of the people is in the construction of the Nicaraguan Canal by the United States Government, which may again bring prosperity.

I inclose a condensed statement of the trade of Nicaragua for the year 1896.

CHESTER DONALDSON, Consul.

MANAGUA, October 25, 1898.

# TRADE OF NICARAGUA FOR THE YEAR ENDING JUNE 30, 1896.

## Imports to and exports from Nicaragua.

#### SAN JUAN DEL NORTE.

I submit herewith a tabulated statement of exports and imports of the Republic of Nicaragua for 1897, for which I am indebted to the courtesy of the distinguished director of the fiscal statistics, the Hon. Erasmo Calderón.

This table is exclusive of the importations and exportations of San Juan del Norte (Greytown), that being a free port; but all of the exports and all of the imports, except for local consumption, are supposed to pass through the custom-house at El Castillo, though it is notorious that a vast deal of smuggling is done, and probably to a greater degree than at any other port in the Republic. Many of the imports to Greytown, not noted in this report, go to Costa Rica, St. Andreas Island, and other convenient points on the coast.

The imports into Nicaragua in the year 1897 were \$1,869,533 (\$838,486);

the exports \$418,052 (\$187,475), as follows:

	Impo	orts.	Expo	rts.
	Silver.	Gold.	Silver.	Gold.
Corinto	\$1, 242, 300 272, 013 131, 868 195, 133 28, 219	\$557, 172 121, 998 59, 143 87, 517 12, 656	\$265, 828 38, 931 104, 112 9, 181	\$119, 224 17, 460 46, 694 4, 117
Total	1, 869, 533	838, 486	418, 052	187, 495

The table fails also to show the exports and imports of San Juan del Sur, the total of which should not be less than that of El Calo. Complete and detailed statistics for this port and consular district for 1898 will probably be available by January or February, 1899, and will be submitted in a supplementary report. For want of data, I am unable to compare the imports and exports for years between 1895 and 1897; nor is there any satisfactory explanation why the imports should have fallen from \$4,116,855 in 1895 to about \$1,869,533 in 1897; and the exports from \$4,994,519 in 1895 to about \$418,054 in 1897.

Despite the heavy depreciation in coffee values, about 100 per cent, exports should show very little if any shrinkage, because it is generally understood that the number of coffee trees in cultivation, the acreage of banana lands, and the production of gold mines have been steadily augmented; and railway transportation facilities have been added to year by year. Political conditions, making onerous military preparation necessary, are probably the chief contributory causes to the decrease in production and exportation, and of the commercial, financial, and agricultural paralysis. It is phenomenal that the country has been able so long to withstand a general commercial and financial crash, as it would seem that a limit to the credit represented by this unvarying excess of imports over exports would, sooner or later, be reached; and the fact that there has been no total collapse demonstrates the existence of abnormal latent force.

Foreign exchange, to meet in part the indebtedness of the commercial interests of the country, as represented by the difference in the unfavorable trade balance, has been forced to a high rate of premium, varying according to locality from 150 to 225 per cent of Government currency and silver. Immigration, labor, and a greater population are the crying needs of the country, and though the soil, climate, and gen-

eral natural conditions combine in presenting a most attractive and inviting field to those who would realize the maximum yield for the minimum expenditure of effort, the jealousy of a portion of the native populace, despite the broader and more liberal views sought to be inculcated and practiced by the Government, is a barrier to immigration; and however much the intelligent and more progressive men of the country may strive to surround the foreigner (immigrant) with liberal and intelligent safeguards and guaranties, unfortunately, it is too often true that he is made to realize that he is in the country merely on suffer-Many of the people have yet to learn that in order to secure desirable immigation, their attitude, the laws, and their application must be friendly; that they must recognize the fact that it is the desirable immigrant who confers the favor, and not the country in permitting him to enter; that the immigrant having the whole world from which to choose, and having chosen to contribute his energies to the improvement of a particular locality, should be welcomed and treated as a colaborer; and, that instead of feeling and acting as if apprehensive of his enjoying greater privileges, the native should make sure that he does not enjoy Such friendly recognition and treatment would soon induce a strong tide of desirable immigration, and develop the waste places in the vast regions of a territory unexcelled and rarely equaled in any part of the world, for productive soil and healthful and agreeable climate. This would solve the labor problem and usher in an era of peace and prosperity.

#### ADVICE TO EXPORTERS.

Trade conditions of Greytown and Nicaragua do not differ in any material sense from those of Central and South America generally. A small percentage only of the best grade of any country's goods can be advantageously placed on the markets here. A great majority of the people are content that an article is cheap; they are wholly unable to distinguish between the clumsy imitations and trash of German manufacture, and the genuine and more staple products of the United States, England, and France. There is, however, a fair percentage who are not only capable of discrimination, but who insist upon having only the highest grade, the finest and best qualities; but that percentage is so small, except in the larger cities, that it is hardly worth catering to.

In the staple lines—groceries, dry goods, and hardware—it depends largely upon the opportunity given the local merchant to buy; and when a preference is expressed by the consumer, it is usually for the American article if it is known; but the local merchant, all things being equal, will naturally prefer to handle the manufactures of his own country, and, as a rule, greater opportunities and better terms are given and more pains taken by the European manufacturer and exporter. The old, old story of our inferior packing, as compared with European methods, recurs. If our exporters could see the rough handling to which the articles are subjected, the breakage and damage, and the excessive freights and customs charges (duties here are collected by weight), owing to the ignorant and unskilled packing, they would possibly appreciate the fact that packing for foreign shipment demands a method different from that in vogue for shipments to "the next railway station" at home. Compactness, strength, and lightness are the main points to be studied in packing for foreign shipment. But I venture little in saying that few consular reports have been written in the past ten years, which did not contain something specific relative

to the unskillful, unwieldy, unsafe, and expensive packing of American

exporters.

Another feature of this question may be referred to. American cloth manufacturers often find it difficult to deal directly with South and Central American merchants, because in print cloths they will not pack assorted patterns in a case. nor will they in any goods pack cases in the shape, size, and weight suitable for pack mules, a greater part of the goods brought to these countries being intended for reshipment to the interior.

Still another feature in our method of handling foreign trade deserves criticism. It has been, and still is, the custom for American manufacturers to operate largely through commission merchants, probably because it saves trouble, in that it is more simple and less directly expensive, the commission merchant and not the manufacturer being burdened with the details of investigation as to credits, sales, collections, etc., and because in this way, they come in contact with but one buyer, who may represent numerous customers. This method is the bane of our foreign trade. It must be conceded that the closer and more intimate the association between the producer, the manufacturer, and the consumer, the better it is for all concerned, and middlemen amount to but so many obstacles to this union. The commission merchant, representing various manufacturers, is not often disposed to push a particular line, and his want of enthusiasm in this respect may reasonably entail the loss of the customer; besides, many of the manufacturers' statements of discounts are never allowed to reach the foreign buver. Not being personally interested in building up a certain line, it is hardly reasonable to suppose that the commission merchant will be as eager as the manufacturer to please all customers.

If it is the purpose of our manufacturers to successfully compete with

Europeans, the middleman must be eliminated.

#### EUROPEAN GOODS IN TRANSIT.

Whatever the merits of our customs laws permitting the shipment in transit of European goods, I am convinced, from experience and observation, that the effect is to facilitate European commerce at the expense of that of the United States.

Millions of dollars' worth of goods are annually sent to the various American ports of entry from Europe, either for immediate transshipment or to be held in bond and shipped to Central and South America, the West Indies, and Mexico, in direct competition with American goods and manufactures. Under this system, it is practically as convenient for a merchant doing business in Greytown to purchase European goods, at European prices, in bond in the United States, as it is to purchase American goods in the same port. By far the greater portion of the goods now bought in Europe for immediate transshipment. or bought and bonded and afterwards sold for transshipment to customers in Central and South America, the West Indies, and Mexico, would be bought in the United States, were our customs law in that particular made less convenient for the European exporter. I submit, further, that the present system stimulates and affords far more substantial aid to European than it does to American shipping. Indeed, matters have come to such a pass that it is well known that a shipment of goods can be made from Liverpool, Hamburg, Havre, or almost any other European port to Central and South America via New York at

almost the same rate of freight as from New York to Central and South America. The fact is that the privilege of transshipment, as it is developed to-day, more than any other one agency, affords material assistance to foreign bottoms; and it is undoubtedly true that foreign bottoms discriminate against the United States.

#### NEED OF POSTAL-PARCELS SYSTEM.

The lack of postal parcels and postal money-order facilities between Nicaragua and the United States, is keenly felt. Nicaragua has postalparcels treaties with France, England, and Germany, but none with the United States.

A postal-parcels arrangement is distinctly wanted, and to be efficient and advantageous, there should be also a "postal money-order" arrangement. The one would be helpful to the other: and, considering the lack of banking facilities between the two countries, the success of the former would depend largely upon the existence of the latter. The mail facilities between the United States and Nicaragua are not the best, but such as they are, they are quicker, safer, and more direct than those between any European country and Nicaragua. It is reasonable, therefore, to believe that with an intelligent, comprehensive, and liberal "postal-parcels packet" and postal money-order system, the mail-order business between the United States and Nicaragua would soon swell to very respectable proportions, and that a great benefit would thus be conferred upon the people of Nicaragua and our merchants.

#### TRADE METHODS.

Merchants and manufacturers hoping to do business here are under the decided disadvantage of there being no agencies, through which the commercial standing of a customer may be learned. It would seem that, under the circumstances, they are practically reduced to the alternatives of selling C. O. D., trusting largely to luck and experience, or sending safe, intelligent, and practical men, thoroughly posted, not alone as to the competition from home rivals they must meet, but also that from Europeans, which will be found sharp and strong in every commercial house in Central and South America. If the latter policy is pursued, the salesman should not forget, from the moment he boards the steamer leaving home, that he has left the railroad, with its bustle, and hurry, and exact schedules, and that he is about to enter into that mysterious land of "mucho calor," and "mañana," where that stirring Yankee phrase, "Time is money," is regarded with good-natured incredulity or passive indifference. He must be endowed with tact and the power of patient perseverance. He will come in contact with the most obliging and courteous class of people this side of France; but he must forget the old habit of drawing his order book and pencil the first thing on entering an office or store. That follows naturally and easily after several personal chats, distributed over a period of several days. In selling goods in Central and South America the race is certainly neither to the swift nor the strong. The salesman should have ample time to systematically canvass the field and, in this way, to select one or two safe customers in each town or city. After the first bill, it will require but ordinary business courtesy, attention, and consideration to hold a customer. After a customer has been thus secured, I think catalogues and circulars and price lists may be of some interest to him and profit to the sender.

It is only through personal intercourse that the American exporter can hope to obtain an intelligent idea of the peculiar wants of a people, whose customs are distinct from those with whom he has had lifelong business relations. I have often heard criticism of the custom of some exporters, to combine in sending out representatives. Manufacturers of several lines will make up a pool and send out a man as an experiment. The criticism is that those firms must be small and weak concerns who can not afford to employ their own representatives, and I confess that this combination salesman often cuts a very ludicrous figure.

I imagine that few merchants in the United States, carrying anywhere from \$20,000 to \$50,000 worth of goods, would tolerate the representative of a house not able to have its own independent salesman. Nor is it uncommon for American merchants and manufacturers to think that, having sent a lot of beautiful catalogues (dreams of art), the Government should do the rest; and the consular service has been maligned by these gentlemen. I am sure that every minister and consul in the service rejoices whenever his eyes behold a piece of American goods in use or for sale in a foreign country, and I am also certain that it would be difficult to name even one such official who does not delight in an opportunity to assist, in every way possible, to increase the foreign commerce of the country. But when the consul is deluged with catalogues and price lists, knowing that no personal representative of the article catalogued has ever "blazed the way" for him by meeting the would be customers personally, he, realizing the utter absurdity of such a policy, feels not a little inclined to despairingly consign the pretty and often costly, but useless, matter to the wastebasket. Again, if I gave advice regarding persons and firms with whom to do business, and especially to whom credit should be given, I would remark, as to a native in business, however wealthy the man or firm may be to-day, to morrow, on account of some political offense or indiscretion, he may be proscribed or banished, and his business impaired.

I call attention to these matters, not in a spirit of unfriendly criticism, but as a recital of facts to justify my suggestion that where the practice of revolution prevails, commercial stability can not exist; and that if our manufacturers and exporters secure only a fair per cent of the trade of the English, German, French, and Spanish doing business in Central and South America, they should have no just cause of complaint. The good faith and integrity of the native merchant are not questioned. It is his precarious tenure of political immunity that is responsible for the conditions I have described. Nor is a criticism of the Government intended. There are many difficulties with which every South and Central American Government has to contend—vast territory, sparsely settled, and poorly equipped transportation and telegraph facilities, and a brave and chivalrous people, impatient of any grievance, whether genuine or fancied. I would suggest, further, that when credits are given and notes for the same are executed, the better policy would be to have the notes payable in the country and at the place of business of the debtor. This would obviate the delays of execution, translation, and transmission of documents, and would render all necessary legal proceedings more direct, prompt, and probably more satisfactory. When accounts are evidenced by notes or when an account is closed by note, it would be best to appoint an agent in the place of business of the debtor, and give him a full power to collect or sue for the same.

Much is said nowadays about the necessity of learning Spanish in order to do business in Spanish America. It is not my purpose to deny

the advantage of a knowledge of the language of any country in which one proposes to travel or to transact business, but in order to deal with the progressive and safe merchants of Central and South America, I do not believe it is absolutely necessary, because those merchants are as a rule, foreigners, and nearly all of them speak English. Besides, the day must come when every citizen of the Western Hemisphere will speak English, and a wider knowledge of this language would increase

Much is also said, in this connection, about Germany's increase in foreign trade and their knowledge of languages. It is true that Germans (at least those who emigrate and engage in commercial pursuits) usually understand several languages; but I am sure that the real secret of their foreign commercial success lies largely in the colonizing schemes fostered by their Government, and to the fact that German merchants are to be found in strong representation in every important commercial town and city of Central and South America, the West Indies, and Mexico. German clerks, bookkeepers, and merchants are everywhere in Central and South America in a much greater proportion than either English, French, or American; and the German merchant, more than any other nationality, gives preference to the wares of his native land.

#### TRANSPORTATION.

The transportation facilities of Nicaragua have undergone, and are undergoing, advantageous changes. The national railway system is being extended, and branch lines are being constructed. Within the past three years, about 26 miles have been built, and the work projected is being prosecuted with commendable zeal. With this 26 miles completed, the national railway line, with spurs and side tracks, is about 126 miles in length.

A railroad is being gradually extended from the Rio Grande River in the direction of the Matagalpa (coffee) district. An option for a contract between Messrs. Cragin and Eyre, of New York and Chicago, and the Nicaraguan Government, for an interoceanic canal, given October 28, 1898, and to become effective October 20, 1899, in the event of the lapse of the present canal contract, provides for the construction of an interoceanic railway, within three years after the company has been organized, and also for building of other lines of railway through all parts of the country, and for purchasing existing lines. The contract includes an absolute grant of 400,000 hectares (988,400 acres) of land, and an option to purchase 1,000,000 hectares (2,471,000 acres) additional, at 1 peso (\$0.448) per hectare. On September 28, 1897, a concession with an ordinary privilege to navigate Lake Nicaragua and the San Juan River, and an exclusive privilege to navigate the Silico Lagoon, and to construct tramways and railroads the length of the line, when it is found necessary to avoid the obstructions of the San Juan River, was given to the Atlas Steamship Company, a powerful English corporation. This concession further provides that the Government, during the period of thirty years for which the concession is given, shall not. extend aid to any other steamship company which may be established on Lake Nicaragua. This concession has been transferred to the Caribbean and Pacific Transit Company, Limited, an offspring and "feeder" of the Atlas Steamship Company, and a short, narrow-gauge railroad from the Silico Lagoon to the junction of the Colorado and San Juan rivers is under construction.

 $\mathsf{Digitized}\,\mathsf{by}\,Google$ 

The water in the San Juan River, between its junction with the Colorado River and Greytown, during about three months in the year, becomes too low for navigation, and the purpose of the Silico Lagoon Railroad is to overcome that obstacle to the uninterrupted transportation facilities of the company between Greytown and Granada.

The Silico Railroad will be 64 miles in length, 3 feet 6 inches gauge, with an average grade of 11 per cent, and curves varying from 10 to 16 degrees. The rails weigh 35 pounds to the yard. The estimated quantity of cuts and embankments is 120,000 cubic yards. On the first mile, at the Silico end, are some very heavy through cuttings, varying in length from 100 to 800 feet and from 25 to 45 feet deep. Great difficulty has been experienced in the construction of the road, because of the heavy and constant rains, and because all of the work is being done by hand. About 3 miles have been finished. Work has practically been suspended until next spring (about March), when the dry season is popularly supposed to set in. The company will then have two years within which to complete the work. The Government gives a subsidy of 5,000 pesos (\$2,243) for each mile completed.

The estimated cost, inclusive of rolling stock and equipment, wharves, warehouses, etc., is £20,000 (\$97,330), but this estimate is probably too low. The bar at Greytown has been and is a source of great danger, expense, delay, and inconvenience to both passenger and freight traffic, but the Government has had a fine dredge built, with which it will be able to keep open and clear the bar and harbor.

With the completion of the Silico Lagoon Railroad and the opening of the bar, it is thought that the Caribbean and Pacific Transit Company will afford a more regular, safe, systematic, and rapid method of handling both local and through freights, which should tend to the development of the Atlantic Coast division, and should make San Juan del Norte (Greytown) the most important commercial port of the Republic; and if a company acquires the national railway system from Corinto, on the Pacific, to Granada, on Lake Nicaragua (as now seems probable), and cooperates with the Caribbean and Pacific Transit Company, it would be possible to divert a reasonable proportion of the Central American freights from the Panama route.

#### BANKING.

There is but one bank doing business in Nicaragua, the London Bank of Central America, Limited. Its principal place of business is at Managua, the capital, and it has agencies in the principal cities of the Republic; but the relations existing between it and the Government are not cordial, and the recent extraordinary session of Congress granted a contract to Dr. Salvador Castrillo, authorizing the establishment of a new bank, as follows:

#### [Translation.]

The National Legislative Assembly decrees:

First. The ratification of the contract between the executive power of the State

and Dr. Don Salvador Castrillo, in the following terms:

The minister of public works of the Supreme Government, especially authorized by the President of the State, for one party, and the other, Dr. Salvador Castrillo, for himself and for his associates, have agreed to the following contract for the establishment. lishment of a bank:

ARTICLE 1. Dr. Castrillo and his associates are to found in the State a commercial

bank, to be known as the "Banco Americano-Nicaragüense."

ART. 2. The principal office and the center of operations of the bank will be in Managua, but the general stockholders' meeting may, within six months after its organization, open branches in the cities of San Juan del Norte, Granada, and Leon.

ART. 3. The general stockholders' meeting will determine and regulate the establishment of other branches within and without the State, and the board of directors

will establish agencies wherever it may be considered convenient.

ART. 4. The bank will engage in the following operations: Advancement of funds on satisfactory guaranties; receipt of deposits; issue of bills payable to the bearer and at sight; buying and selling domestic and foreign letters of exchange and telegraph orders, and whatever other operations are common to banking establishments.

ART. 5. The capital of the bank shall be two million and a half pesos silver, or 1,000,000 pesos gold, divided into 2,000 shares of 1,250 pesos each, and may be augmented by consent of the general stockholders' meeting, with the approval of the Supreme Government. The bank may commence its functions after one-fourth of the capital has been subscribed.

ART. 6. The value of the shares shall be paid in the current metallic money of the country, in calls not to exceed 10 per cent each, and with intervals of one month

between each call.

Only the half of the nominal capital may be called; the other half shall remain as an ultimate reserve, to be called upon in case it should become necessary to cover the

responsibilities incurred by the bank.

ART. 7. The shareholder who does not complete his quota on the final day fixed shall pay a fine of 2 per cent on the nominal value of the share; and if, thirty days after, the payment has not been made, the share shall be forfeited to the bank, with the payments previously made. Those members who desire at once to pay the full 50 per cent of their shares may do so, and shall be entitled to a bonus of 1 per cent of the nominal value of their stock. The payments made on calls shall be indorsed on the back of the shares. Said shares are personal, and shall be transferred with the written approval of the board of directors previous to being registered in the book kept for that purpose by the bank. If the transfer is made in favor of a shareholder, it will be sufficient to advise the board of directors, in order that the entry may be made in the respective book kept for that purpose.

ART. 9. The bank shall be exempt for ten years from contributions, taxes or imposts, ordinary and extraordinary, whether fiscal or local, or of whatever other

nature.

ART. 10. The bank may emit bills payable at sight and to bearer, but must always maintain in the safes of its branches or agencies of the State not less than 40 per cent of the value of the bills in circulation in gold or silver money.

ART. 11. The bank shall be obliged to exchange metal for its bills on demand.

ART. 12. The bills issued by the bank shall be as follows: "One," "five," "ten," "twenty-five," "fifty," and "one hundred" pesos, bearing the signatures of the director-manager and of the cashier of the bank, and executed so as to guarantee against counterfeiting, and to bear the seal of and to be registered in the national treasury. The bills that become damaged shall be replaced by new bills, burned in the presence of the chief cashier and recorded in one act, as is done with the national bills.

ART. 13. The falsification of bills of the bank shall be considered the same as the falsification of public documents and the same penalties shall be applicable.

ART. 14. The responsibility of the members of the bank shall be limited to the nominal value of their shares

ART. 15. In case of the death or absence of a shareholder, his legal representative

shall have the right to speak and vote in the general stock holders' meetings

ART. 16. All shareholders of the bank may participate in the general stockholders' meetings, and sessions may be held with two-thirds of the subscribed stock represented. In case of a second citation for a general stockholders' meeting, in default of the response of the stipulated two-thirds to the first citation, the session will be held with those who do respond. Every citation for a general stockholders' meeting shall be made through the official periodical, and shall not be for less than eight days before the meeting. The board of directors may forcibly convoke an extraordinary general stockholders' meeting by written petition signed by eight members (shareholders).

ART. 17. In a general meeting of stockholders, each share has the right to one vote, and those stockholders not present may be represented by another shareholder, with written power to that effect. Resolutions of the general stockholders' meeting will

be voted upon and adopted by an absolute majority of the votes present.

ART. 18. The general balance of the bank shall be made on the last day of February and the last day of August, and shall be published in the official periodical and

submitted to the ordinary general stockholders' meeting, with the semi-annual report of the managing director in the months of March and September.

ART. 19. The management of the bank shall be by a managing director and a board of directors, elected by the stockholders at a general stockholders' meeting.

ART. 20. The managing director is to be assisted in the administration of the bank by three shareholding directors, to be selected by the stockholders at a general

stockholders' meeting. No one shall be employed in the bank who has been declared to be in a bankrupt state or who has transferred his realty.

ART. 21. The managing director, with the three shareholding directors, will form the board of directors, which shall meet daily, with not less than three members

ART. 22. The attributes of the board of directors shall be: First, to appoint and remove, upon the recommendation of the managing director, the principal and subordinate employees and to fix their compensation; second, to formulate the rules for the interior conduct of the bank, and such modifications as may be found essential, which shall be submitted to the general stockholders' meeting for approval; third, to give notice of the calls and dividend; fourth, to convoke the ordinary and extraordinary general stockholders' meeting; and fifth, to approve the transfers of stock, and to make complete those things that are not herein provided for in representation of the bank.

ART. 23. The signature of the bank shall be by the managing director, to whom also will correspond the judicial representation of the bank. For the accidental failure of the managing director, one of the directors, by his order, will act in his

ART. 24. The general stockholders' meeting shall fix the amount of the compensation to be paid the managing director.

ART. 25. The minister of finance, in person or by delegates, may assist in the monthly balances to verify the existence in gold or silver money of the amount required in relation to the bills in circulation, or to demand extraordinary examinations when it is judged convenient, and if it results that there is not in the safes, in metal, 40 per cent of the value of the bills in circulation, the bank's operations shall be suspended until the said 40 per cent has been reestablished; and if it results that the bills in circulation are not effectively guaranteed, the bank will be compelled to go into liquidation.

ART. 26. The profits of the bank shall be distributed as follows: Five per cent of value of the net profits to create a reserve fund, and the rest to be divided propor-

tionately between the shareholders.

ART. 27. The bank in its judicial actions shall enjoy the following privileges:

(1) The jurisdiction of the mercantile or commercial law. (2) Exemption from the payment of judicial fees. (3) In bankruptcy proceedings, the credits to its favor shall be considered for the purpose of preference the same as the credits of

the national treasury.

ART. 28. If convenient for the Government, the bank in those places in which branches are established, and at its principal office, shall carry the current account of the Government as cashier without charge, and the bank shall pay interests the same as for individual deposits; it shall accept for collection, and without exacting commission, the promissory notes and other documents that the Government may have for collection; it shall facilitate, free of cost, the transfer of Government funds between the principal office and the branch offices or between the branch offices

ART. 29. The bank shall publish monthly in the official periodical a statement of its condition, and each six months the general balance and the report of the board of directors shall also be published.

ART. 30. The bank shall not make loans on deposits of its own stock.

ART. 31. The society (company) formed by the "Banco Americano-Nicaragiiense" shall be for the term of twenty-five years, unless a general stockholders' meeting should resolve to go into liquidation before the expiration of that term, for which

purpose four-fifths of the stock interests must vote in the affirmative.

ART. S2. The bank shall be forced into liquidation in case that any of its six months' balances show the loss of the reserve and of 30 per cent of its capital. It will also be forced into liquidation when it fails to perform any of its obligations in conformity to articles 4 and 11, and when, admonished by the minister of finance, it persists in the nonperformance of its obligations during the period fixed by the minister.

ART. 33. Whenever the bank finds it necessary to go into liquidation, a general stockholders meeting will designate the person or persons to have charge of the same and the manner of its liquidation; and if the liquidation is forcible, the Government shall nominate a representative, who shall supervise the same.

ART. 34. In no case, shall the rate of discount of the bank exceed 10 per cent per annum, or the rate of interest for loans exceed 12 per cent.

ART. 35. The present contract constitutes the law of the "Banco Americano-Nicaraguenes," and it can not be modified except by agreement of a general stockholders' meeting, in which a two-thirds vote of the subscribed stock shall participate,

with the approval of the Government and ratification by the Congress.

ART. 36. The bank shall be established within one year from the date of the ratification of the present contract, which period may be extended for one year at the option of the executive of the State; and in case complete performance shall be

lacking, all of the concessions herein authorized shall be forfeited.

ART. 37. The domicile of the bank shall be in Nicaragua; however, the society (company) which shall be established may incorporate in any of the States of the United States of America.

The Government having read the terms of the foregoing contract, and having found it to conform to the instructions given, gives its approval.

MANAGUA, October 27, 1898.

#### EXPORT DUTIES AND TAXES.

The Nicaraguan export duties are: On coffee, 2 pesos (\$0.877) per 100 pounds; on rubber, 10 pesos (\$4.48) per 100 pounds; on bullion, 1 peso (\$0.448) per ounce. These articles are imported into the United States free of duty.

The following decree was promulgated after my report was written,

but its importance prompts me to send it as a part thereof:

#### [Translation.]

#### EXPORT DUTIES ON RUBBER, ETC.: TAX ON EXPLOSIVES.

The President of the Republic: In consideration that, notwithstanding the efforts made by the Government to maintain the national credit, in view of the requirements of the foreign and domestic debt, the tendency to antagonize and depreciate the bills of the national treasury continues, and it is the duty of the administration to dictate efficacious measures to render permanent and unalterable the value of the

In consideration that, owing to the distance between the city of Bluefields and the other towns of the Atlantic coast, the supply of powder in the fiscal offices is irregular, stimulating contraband, diminishing the receipts from its sale; and in view of the fact that the merchants of that zone have solicited authority to sell powder,

offering to pay a privilege tax; In consideration that, for the proposed accumulation of funds for the exchange and amortization of the treasury notes, it is indispensable that other articles should be taxed;

Considering, further, that most of the transactions in the said locality are made in

gold, it is decreed as follows:

ART. 1. Permission will be given to the merchants of the Atlantic coast to sell powder, lead, and fulminating tubes (percussion caps) upon the payment of a privilege tax of 25 pesos; but not more than 50 pounds of powder, 200 pounds of lead, and 1,000 caps, shall be kept by any establishment.

ART. 2. The application shall be written and presented to the respective authorities accompanied by a present lead to the respective authorities.

ties, accompanied by a personal bond payable to the said functionaries, which shall be a public document. These requisites having been complied with, the license will

be granted.

ART. 3. The bond to which the forgoing article refers shall be held for payment of any fines imposed for violations of the law, and for other liabilities resulting from the sale of the articles herein specified, in conformity with the rules governing frauds against the treasury, and for whatever illegal use there may be made of the articles enumerated.

ART. 4. The fiscal employees shall keep on hand a sufficient quantity of the articles specified to supply those who have license. They are liable to a fine of 50 pesos for

each infraction of this clause.

ART. 5. The minister of finance shall provide the respective fiscal employees with receipt books for the licenses to which article I refers, which shall be numbered and registered for its proper control.

ART. 6. The payment of the privilege tax, and of those that correspond to each particular article, shall be effected in coined silver only.

ART. 7. For each turtle exported through the ports of the Atlantic, 50 cents, gold,

shall be paid.

ART. 8. For each kilo, and fraction thereof in proportion, of gold exported, 17 pesos gold, or the equivalent in coined silver, when the exportation is effected by the ports of the Pacific.

ART. 9. After this date, the exportation of rubber in the Republic will be reestablished under an export duty of 12 cents, gold, for each kilo, or the equivalent in coined silver, if the exportation is by the Pacific.

ART. 10. The receipts from the duties specified in the preceding articles will be transferred by the respective offices, monthly, to the general treasury.

ART. 11. The employee who diverts these funds to other channels will incur a fine equivalent to double the amount so diverted, without release from punishment for the dereliction.

ART. 12. These imposts, as well as the duties to be paid by Mr. H. C. Emery for the exportation of woods, in conformity with article 4 of the contract celebrated March 5, 1898, shall create a reserve fund for the exchange of the treasury bills or for their amortization.

ART. 13. The general treasury will open a special account for the funds collected

under the decree.

ART. 14. The violators of this law shall be punished according to the regulations

regarding fiscal frauds applicable thereto.

ART. 15. That this decree may become operative from the date of its publication, every disposition antagonistic to it is hereby abolished.

Managua, December 9, 1898.

WILLIAM B. SORSBY, Consul.

# WEST INDIES.

# BRITISH WEST INDIES.

#### BAHAMAS.

The general trade of the Bahamas during the year 1897 showed a variation from that of 1896 so small as to be remarkable, as appears from the subjoined statement:

Exports and imports for—	
1897	\$1,630,740.05
1896	1, 624, 176. 84
Considering that 1896 was an exceptionally good year fo	
showing is not bad.	

#### TRADE WITH THE UNITED STATES.

As usual, the condition of trade between this colony and the United States was quite satisfactory, there being a small increase over 1896, when the trade was above the average.

Trade with the United States:	
1894	\$1,014,757.71
1895	1, 121, 635, 03
1896	1, 180, 682, 00
1897	1, 191, 489. 05

These figures indicate the steady growth of trade between the Bahamas and the United States; and the large proportion we have obtained is shown by the subjoined statement:

Total trade of colony in 1897	\$1,630,740.05
Trade with the United States in 1897	1, 191, 489. 05

Among the many items going to make up the imports from the United States may be mentioned: Ale and porter, \$2,000; bicycles, \$10,000; butter, \$22,000; cattle, \$11,000; coffee, \$6,000; corn meal and hominy, \$28,000; coal, \$3,000; flour, \$124,000; lard, \$9,000; lumber, \$9,000; meat, salted and fresh, \$38,000; machinery, \$13,000; fertilizers, \$6,000; oats, \$4,000; oil, \$10,000; vegetables, \$8,000; rice, \$3,000; shingles, \$5,000; sugars, \$15,000; specie, \$10,000; tobacco, \$20,000; cotton, linen, woolen, and silk goods, \$95,000; earthenware, glassware, and furniture, \$94,000: hardware and tinware, \$12,500; preserved fruit and meats, \$31,000.

We have also taken exports from this colony as follows: Coffee, \$17,000; sugar, unrefined, \$9,000; tobacco, \$2,000; turtle shell, \$3,000; hemp or sisal, \$21,000; barks, \$5,500; marine curios, \$1,500; grape fruit, \$16,000; oranges, \$16,000; pineapples, \$120,000; preserved fruits, \$21,000; sponges, \$306,000, etc.

The trade of this colony with the United States is well looked after by certain American firms who have studied the wants of the people, and who are enterprising and accommodating. Regular and frequent steam communication assists materially, a British and an American line running to and from New York, the two making three trips per month.

#### FRUITS.

The fruit crop of 1897 was much above the average, and fair prices on the whole were obtained. In fact, the declared values were 50 per cent more than in 1896, which year, however, was under the average. The value of the pineapples shipped in 1897, all going to the United States, was \$119,623.45; that of oranges was \$16,740.65, and that of grape fruit was \$16,098.90. Grape fruit has come into great demand during the last year or two, and it promises in the near future to be quite an addition to the list of exports. Nearly three times as much was shipped this year as last, and prices ran up to \$40 per thousand, oranges averaging only about \$6 per thousand. There was a decrease in the export of canned fruit, that shipped in 1897 being worth only \$20,288.46, as against \$32,527.68 in 1896. A canning factory, started with Baltimore capital in 1896, was abandoned in 1897 as an unprofita-Since the disasters to oranges in Florida, by reason ble investment. of frost, have been considerable, inquiry has been made as to land in this colony suitable for orange cultivation (the Bahamas being below the frost line), and some Americans have bought small tracts for that purpose. The industry might readily be largely developed by men who are competent and who have capital.

#### SISAL HEMP.

This industry, developed a few years ago by Sir Ambrose Shea, then governor of the colony, continued depressed during most of 1897, not having recovered from the bad results due to the unfortunate selection, by many investors, of lands unsuited to the culture of the plant. New investors are profiting by the mistakes of the others, and their plantations promise well. Prices of fiber ruled low all through the year, which added to the discouragement of the growers, and the quantity exported in 1897 was no greater than that shipped in 1896. Toward the end of the year, prices began to improve, and at the present time, they have reached such a figure as to greatly encourage all interested, and exports are increasing. I am still of the opinion, originally expressed concerning this industry, that it will show a steady and permanent increase until it becomes a reliable and valuable source of income to this colony.

#### THE SPONGE TRADE.

The 500 small vessels and the 5,000 people employed in the gathering and shipping of sponges continue to find steady and remunerative employment. This industry remains, as it has for many years, the mainstay of the colony in value and importance. The quantity of sponges shipped in 1897 did not equal that of 1896, being 1,255,137 pounds as against 1,586,372 pounds in 1896; but the market value of the article increased so much that the value of the shipments in 1897 showed an increase over 1896 of \$43,895.83.

The following statement will show the steady development of the industry:

Sponges shipped in—	
1894	<b>. \$287, 551, 75</b>
1895	. 328, 804, 5b
1896	
1897	

The United States continues to take by far the greater portion of the sponge product, the amount in 1897 being \$306,102.85, as against \$287,235.50 in 1896. The balance of the shipments for 1897, viz, \$132,422.33, went to Great Britain, France, Holland and Germany. Prices of sponges have ruled high during the entire year.

#### A HEALTH RESORT.

The equable and mild climate of the Bahamas has long been noted for its beneficial effects in cases of lung and throat troubles, the islands furnishing a pleasant residence for those who desire to avoid the cold weather from November to April. As a consequence, many people come here every winter. The number of strangers who came to Nassau during the winter of 1897–98 was much in excess of that of any previous season, owing to the fact that a fine passenger steamer called the *Miami*, belonging to Henry M. Flagler, made regular and frequent trips during the months of January, February, March, and April between Nassau and the port of Miami, in Florida, shortening the sea voyage from eighty-four hours from New York to fifteen hours from Florida.

The hotel accommodations proved insufficient, and many private families opened their houses for lodgings. Negotiations looking to the building of a large hotel in Nassau were opened between Mr. Flagler and the colonial authorities. These have not yet been completed, but there is little doubt that within a short period, Nassau will have superior hotel accommodations, which, with the southern passenger service, is all that is needed to bring the Bahamas much prosperity as a winter resort.

#### PRESENT CONDITION.

The present condition of the islands is fair, with an outlook for yet better times in the near future. Its relations with the United States, both trade and social, will become closer, to the mutual benefit of both communities. The people, products, and manufactures of our country are regarded with decided favor in this colony, as indeed they have been for a long time past.

THOS. J. MCLAIN, Consul.

NASSAU, May 30, 1898.

#### SUPPLEMENTARY REPORT. 1

The course of trade during the year ended June 30, 1898, was very steady, as indeed is usually the case, the situation of the colony making sudden fluctuations in business uncommon.

Both the export and import trade of the Bahamas is now practically monopolized by the United States, at least from 75 to 80 per cent of it having come under our control; and this proportion, I may add, is being steadily increased.

The reasons for this condition of affairs are easily apparent. In the first place, we are very near the Bahamas, and our communication with them is frequent. New York is but three and a half days away, and with that port there are three steamers per month the year through. In addition, numerous sailing vessels ply to and fro between Nassau, Key West, Jacksonville, and other Southern ports.

Again, freight charges and passenger rates are reasonable, exchange is abundant, New York merchants fill orders promptly, giving reasonable credit, and American goods are deservedly popular by reason of superior quality, style, and finish.

When to these considerations we add the fact that the United States furnishes a good market for all this colony's exports, the proceeds of which are very certain to be invested in our food products and our manufactures, there seems to be no mystery at all as to why we control the trade of the Bahamas. I have had the pleasure of witnessing our trade with this colony grow from 40 per cent, in 1877, to 80 per cent in 1898.

I judge that the exports and imports of the Bahamas during the year ended June 30, 1898, may be safely stated at about \$1,500,000, of which, say, about \$1,200,000 was controlled by the United States.

There are no railroads, manufactories, or mines in the colony, and therefore there is no demand for articles employed therein; while the rocky nature of the soil prevents the use of agricultural machinery to any extent.

The shipbuilding industry is carried on to a limited extent, being confined, however, to small vessels, averaging perhaps 30 tons, employed in the sponge and turtle industries, and in interinsular communication. Most of the materials used therein are brought from the United States.

The machinery used in cleaning sisal fiber is imported from the United States, as well as the engines and the boilers for the same.

The banking facilities of the colony are adequate to the demand; exchange is abundant, and reasonable discounts are readily obtainable, the ordinary rate of interest being 6 per cent.

There is ample circulating medium, about one-half the money afloat being American gold and greenbacks. The rest consists of British silver, local bank notes, and British gold. American gold and paper money are at par with British gold, but our silver is subject to 4 per cent discount.

In regard to the packing and shipping of merchandise to this colony, I may say that the practice in vogue is entirely satisfactory and there are no complaints. The same methods are to be observed as are followed in making shipments of goods from New York to any one of our Southern ports, such as Charleston or New Orleans, by coasting steamers. As to the matter of cotton textiles consumed in the Bahamas, they may be said to consist of substantially such as are sent by our leading jobbers to their trade in our Southern States, with respect to width, count, and weight. In fact, the needs and tastes of the Bahamas are quite similar to those of our own Gulf States. Nearly all this class of trade has gone from Great Britain to the United States, as the result of judicious efforts on the part of those interested in our export trade.

The war with Spain had a tendency to unsettle trade relations during the first half of 1898, the regular steamers of the Ward Line, which were the Bahamas mail contract boats, being taken by our Government for transport service, their places being very indifferently filled by such foreign tramp vessels as could be obtained in the emergency. The local steamer Antilia (British) assisted materially in keeping up trade facilities during this period.

Mr. Flagler has just concluded a contract with the government, by which he becomes the owner of the colonial property called the Royal Victoria Hotel, which is to be remodeled, refurnished, and put in condition for the winter season of 1898-99. It is also understood that he will build, without delay, another large hotel to meet expected requirements in the near future. Last winter, there were some 2,000 visitors here, against an average of 500 in ordinary years.

It is expected that under Mr. Flagler's influence, Nassau will now take its proper position as one of the most popular winter resorts in this quarter of the globe. This will more than ever bring these islands under American influence and control, both commercially and socially.

There is much apprehension felt by the colonists lest their fruit and sponge trade may be seriously injured by the new relations which Cuba and Porto Rico are to bear toward the United States, and this fear has induced them to welcome with great gratification anything that gives promise of developing their resources in the way of a health and winter resort.

Thos. J. McLain, Consul.

NASSAU, September 20, 1898.

#### BARBADOS.

While the trade of Barbados did not show any appreciable increase in 1897, it is still encouraging to report that there has been no marked decrease. The exports exceeded those of 1896 by \$90,674.28, while a

decrease of \$200,940 took place in the imports.

The total quantity of sugar exported was 67,609 hogsheads, and this is considered to have been a fair average annual output. If the prices obtainable ten years ago for sugar had been realized on the crop of 1897, the sugar industry of the island would be in a prosperous condition and the future free from anxiety. But unfortunately, however productive the soil may be, and especially suitable for the growing of the sugar cane, there seems to be little doubt that all these advantages are outweighed by the prevailing low prices, which make the manufacture of sugar here unprofitable; and in this extremity the planter, unlike his confrère in the neighboring colonies, has no other industry to which he can turn his attention. The very formation and topographical features of the island, which tend toward its sanitation, do not adapt it for the cultivation of cocca, arrowrect, and fruit, which grow so readily in other West Indian islands. There are limited areas on which these articles can be produced, but locally not with profit to the planter.

Mining for what is known as maujak, a species of glance pitch, has been attended with some success, and greater developments are hoped for. It is asserted by some people here that there is a vast subterranean lake of liquid asphalt in the vicinity of the maujak deposits, but it has

not yet been located.

The total of manjak exported in 1897 was to the value of \$18,800; of

this amount, \$12,967.50 went to the United States.

The total imports decreased from \$5,244,435.60 in 1896 to \$5,043,495 in 1897. Consequent on this decrease in the total, the amount imported from the United States in 1897 shows a decrease of \$175,880 from that of the previous year.

The chief imports from the United States were flour, bread, corn, cornmeal, salt beef, bacon, pork, and lumber. Nearly all the foodstuff

came from the United States, upon which market Barbados is almost entirely dependent for its food supply. This is recognized from the fact that the value of the articles composing food and drink, imported from the United States in 1897, was \$1,253,895.63, as against \$483,755 from Great Britain. In unmanufactured articles, I find that the amount imported from Great Britain in 1897 was \$658,785.72, while only \$116,600.25 came from the United States. This is to be regretted, as I have little doubt that our country can easily compete in many articles in this branch of trade, and would hold the market, if proper pains were taken to introduce the goods into this country. American boots, shoes, hats, and men's furnishing goods are comparatively unknown in the Barbados market, and it is with difficulty that the people can be made to believe that these articles can be imported from the United States in a better quality and at a lower figure than those now sold.

There is a marked conservatism observable in the importation of goods here, traders exhibiting great unwillingness to purchase a different class of goods from that used hitherto, in the fear that they will not

please the public.

There are many articles which I am of the opinion could be imported from the United States to advantage. American canned goods are not known as widely as they should be, while American preserves are unobtainable, and the same may be said of our table butter; but until our exporters adopt the British system of sending representatives to place the goods on the market, and obtain agencies for them, I am afraid little increase will take place.

I receive a great many letters from our merchants and manufacturers asking for information, and inclosing trade circulars and price lists. These matters always receive my prompt attention. The merchants here receive many circulars and lists, but from my observation and experience, such methods are of little or no value. Importers here give them little attention, and they must be convinced by practical demonstration that American goods are superior and cheaper, before they can be induced to abandon trade relations with the mother country, which have existed so long that they have apparently become fixed principles with the Barbados importers.

In 1898, cement to the value of \$15,936 was imported, and of this amount, only \$54 worth came from the United States. There is a fine

opportunity here for our exporters of cement.

United States bicycles are preferred to those of other countries, and all the leading makes can be had at reasonable prices. About 800 are in daily use.

American carriages also hold the market, and vehicles to the value

of \$27,600.50 were imported from the United States in 1897.

The number of vessels which entered at the custom-house here in 1897 was 2,394, of which 378 were steamers. This number does not, however, represent the total number of vessels which called during that period, as in the statistics, no notice is taken of those vessels which only reported and did not make formal entry at the custom-house. The total number of American vessels which entered was 164.

These figures show that Barbados is still preeminently the shipping port of the West Indies, there being no other port in these waters where a third of this number of vessels entered during that period. The geographical position of the island makes it an extremely convenient port of call for sailing vessels, and shipmasters have not been slow to find this out. Here, at certain seasons of the year, vessels from all parts

of the world can be found, some seeking charters, others loaded with the products of China, Japan, Australia, New Zealand, South Africa,

South America, and other far distant ports, awaiting orders.

The Barbados Railway Company, which suspended operations in 1897, has not yet been resuscitated. The suspension of traffic has been a source of great inconvenience to the planters and others residing in the country districts, who used the line for conveying the produce to town. The owners of the maujak mines, in the northern district of the island, have felt the loss of the service severely, as the maujak has now to be transported in carts, at great expense, over a rugged part of the island to Bridgetown.

I am of the opinion that there is an opening here for one of our large electric companies, to lay down a light electric railroad around the island. The distance covered would be about 60 miles, and the country is very suitable for a line of this description. The town and suburbs are yet lighted by gas, while mule cars are used in the streets. I have very little doubt that if this matter were placed before the legislature of the island in the proper light, electricity would soon be in general

use throughout the island.

During the year, a factory was opened for the manufacture of tobacco from American leaves imported here, it being found that the tobacco could be manufactured from foreign leaves and sold at a cheaper rate than the American manufactured article, the import duty on the latter being much heavier than on the raw leaf. The factory is managed by an American, and is in active operation. It is said to be a success.

The health of the island was excellent during 1897.

The revenue for 1897 was \$923,530; expenditure, \$862,755. The amount expended on education in 1897 was \$53,650.

The total imports for 1897 were \$5,043,495; exports, \$3,680,815.

The value of imports from the United States in 1897 was \$1,809,540; exports to the United States in 1897, \$2,147,635.

S. A. MACALLISTER, Consul.

BARBADOS, July 12, 1898.

#### SUPPLEMENTARY REPORT.

In compliance with the requirements of the Department's circular of the 5th of August last, I submit the following report on the commerce and industries of Barbados for the six months ending June 30, 1898.

Annexed hereto is a statement from the colonial records, access to which has been generously accorded by the authorities. The system adopted does not admit of accurate valuations until the close of the colonial fiscal year, but the data obtained is sufficiently explicit for all practical purposes.

The revenue of the island for the half year ended June 30, 1898, was \$479,730, being a decrease of \$945 from the corresponding period in 1897.

Thirty-nine thousand seven hundred and seventy-one hogsheads of sugar were exported during the half year, of which 38,466 went to the United States; 36,585 puncheons of molasses were exported during the same period; of these, 24,841 puncheons went to Canada, 11,563 puncheons to the United States, and 181 to Great Britain.

In my annual report, I alluded to the fact that the Barbados Railway Company had suspended operations. The company has now been bought out by the bondholders at a judicial sale, and a new and lighter line will shortly be laid down. I understand that some of the rolling

stock will be of American manufacture, and would point out to our exporters that there is probably an opening for introducing American railroad material.

The prices of American food stuffs increased considerably during the late war, but have now regained their normal level. A considerable portion of the food stuffs imported here during that period found its way to Spanish ports. It was, however, very difficult to obtain evidence of the exportation. These shipments at one time caused a scarcity of food stuffs, but frequent and large importations soon stocked the market.

The American carrying trade suffered greatly during the war, as all these importations were brought in British steamers, and the number of our sailing vessels which called here during the half year was about one-third of the number for the same period in 1897.

I give herewith statistics which show, as accurately as possible, the trade of the island for the half year:

Value of goods imported from January 1 to June 30, 1898, which are subject to ad valorem duties.

SAML. A. MACALLISTER, Consul.

BARBADOS, October 8, 1898.

#### BERMUDA.

The commerce of Bermuda is very limited. There are no manufactories, save a few small mills for preparing arrowroot, grown in the colony. There are no railways. There is a local telegraph and a telephone company. The Halifax and Bermuda cable, running to Jamaica, via Turks Island, connects the colony with the outer world. Banking facilities are furnished by the Bank of Bermuda, Limited, and the private banking house of N. T. Butterfield & Son. There is also a savings bank, with two branches.

The pound sterling is reckoned at \$4.80 American gold. A commission of 1 per cent is generally charged for cashing checks or drafts on the United States.

The tariff is for local revenue; it is 5 per cent ad valorem on all goods, excepting on spirits, wines, cigars, and tobacco, which are taxed according to the packages and quality.

Communication with the United States and Great Britain is supplied by the Quebec Steamship Company, which during about five months, covering the winter season, runs a weekly steamer; the rest of the year, one twice a month. Pickford & Black send a monthly steamer from St. Johns, via Halifax, to Demerara and intermediate ports, calling at Bermuda. The steamer *Beta* makes a monthly trip from Halifax, calling here, at Turks Island, and Kingston, Jamaica.

Occasional tramp steamers from England, Canada, and the United States, and also sailing vessels, with cargoes of lumber, hay, feed, ice, etc. (returning in ballast), visit these islands.

The colony is largely dependent on the army and navy of the Empire, Bermuda being an important naval and military station, for its prosperity; also upon the influx of visitors from abroad during the winter season.

For the maintenance of the large body of men in both branches of the service, for the 16,000 inhabitants and the visitors, nearly all the food supplies, including canned goods, are imported from the United States. From British America comes a fair proportion of cattle feed. Live stock is brought on the steamers from New York. The island produces but little beyond the onion and potato crops that are shipped to the United States in the spring months, and lily bulbs later on. Data in regard to these productions have been furnished the Department.<sup>2</sup>

<sup>&</sup>lt;sup>1</sup>In reply to circular of August 5.

See Consular Reports No. 217, October, 1898; Advance Sheets 218, September 14.

The trade of the colony is purely local, and is conducted by retailers. Dry goods, such as shirtings and sheetings, are largely imported from the United States. Here as elsewhere, American goods are preferred, as containing less "filling" or "stuffing" than the English makes. We also furnish certain lines of prints and cotton dress goods, but woolen and silk fabrics, novelties, etc., are brought from Great Britain.

Hardware is imported from England; agricultural implements from the United States, but there is little trade in this line, there being less

than 3,000 acres under cultivation.

As to packages, marks, and numbers, it may be said that buyers from Bermuda select their stocks for a retail trade and do not interest themselves in such matters.

W. MAXWELL GREENE, Consul.

#### ST. GEORGES.

In reply to the circular of the Department of State, dated August 5, 1898, with regard to commerce and industries, I beg to state that no marked changes have occurred at St. Georges since my report of September 29, 1897, other than the dredging and deepening of "The Narrows" in Ships Channel, leading from east end of said channel to Grassy Bay Anchorage at the west. This improvement greatly facilitates the pilotage of large vessels from and to sea.

Wm. D. Fox, Vice Commercial Agent.

ST. GEORGES, October 25, 1898.

#### LEEWARD ISLANDS.

#### ANTIGUA.

From a commercial point of view, the year 1896 was one of the most unfortunate and depressing in the history of the capital of the Leeward Islands. This condition was due to the continued misfortunes that attended the cultivation of the solitary staple of Antigua, viz, sugar. Drought, aggravated by the ravages of death dealing insects in the cane, resulted in a large diminution of the marketable crop, while these conditions were in turn aggravated by the low price of the staple in foreign markets.

It needs but a glance at the statistical data embraced in this report to realize, more eloquently than the words can picture, the evil times that have fallen upon the island. But four short years ago, its exports to all countries exceeded for a given year \$800,000. Two years later, in 1896, when these figures had been reduced some 25 per cent, or by nearly \$200,000, the belief was expressed by planters and merchants alike that bedrock in the period of depression had been reached. These hopes, however, were not realized, the exports for 1897 showing a further falling off.

It may be properly added, in this connection, that the exhibit for the current fiscal year ending in December, 1898, will be still more unsatisfactory, owing to a continuation of the conditions that were responsible for the short crops of preceding years. For the first time in the history of the island, widespread destitution has prevailed, especially among the colored element, of which the bulk of the population is composed. Cases of sickness as well as deaths, due primarily to starvation, have been so numerous as to furnish material for an appalling mortuary record, which would have been greater but for the public relief afforded by the Government and supplemented by systematic private charity. It is gratifying to be able to report, however, as a silver lining to the cloud, that the prospects for the ensuing year, and it is to be hoped for many years to come, are eminently more encouraging.

The financial stringency has, in a measure, been lessened by the action of the Home Government in appropriating a considerable sum toward meeting the deficiency in the island treasury. Further relief is prom-

<sup>&</sup>lt;sup>1</sup> Commercial Relations, 1896-97, Vol. I.

ised by the establishment, in the immediate future (also under the auspices of the Home Government), of a central factory, which will give a decided impetus to peasant proprietorship, or the taking up by natives, for the purpose of sugar planting, of small allotments of lands now out of cultivation. Finally, the planting of large areas of estates with new canes, coupled with the bountiful rains of the summer and fall of 1898, justify the prediction by veteran planters at this writing (October, 1898) that the crop of 1898–99 will be one of the largest of the past decade.

#### DECREASE IN IMPORTS.

It was but logical that the conditions heretofore referred to should have had a pronounced effect upon the imports of the island. The total for goods brought in for domestic consumption and use showed, for 1897, a falling off of \$250,000 as compared with 1894, and of approximately \$45,000 as compared with 1896. Of this latter loss,

nearly \$30,000 was borne by the United States.

Here again the extent of the destitution is evidenced, by the nature of the imports that show the most marked decline. The masses were without money and could not purchase the necessaries of life. As compared with 1896, the imports of pork fell off, in round figures, some \$12,000; of beef, \$12,000; of dried fish, \$3,000; of lard, \$600; of general groceries, \$600; of butter, \$800, and so on through a long list. On the other hand, several items show an increase; notably, bread and biscuits, \$5,500; corn meal, \$3,000; rice, \$575; hams and bacon, \$500; white and spruce pine, \$300; boots and shoes, \$500; kerosene, \$2,700, and soap, \$1,200.

With improved local conditions, the prospects are that trade with the United States will be very largely increased during the coming year. There are already, in fact, pronounced signs of a diversion of imports from Great Britain and other countries, in favor of the United States. One large general store, established during the present year, is purchasing fully 70 per cent of its supplies in the New York market, in spite of the fact that it is one of a chain of stores owned and operated by capitalists residing in Great Britain. Another firm long established, and which had hitherto dealt exclusively in fancy breadstuffs with English manufacturers of world-wide reputation, has within a few months, entirely transferred its patronage in this line to American houses.

United States butter is beginning to rapidly supplant the Danish and Canadian products, and placards extolling our meats, groceries, and breadstuffs, and advocating their use, are for the first time on record being prominently displayed in and about the retail stores and whole-

sale warehouses.

These citations might be continued, but it is sufficient to say, in brief, that the indications point in a most pronounced degree to a steadily increasing demand for American products. It is scarcely necessary to add that these conditions would be decidedly accentuated, in the event of a treaty of commerce between the United States and the Leeward Islands being satisfactorily concluded.

# JURRENCY.

The circulating medium remains of the same character as in past years, viz, notes of the Colonial Bank of the denomination of \$5, equivalent to the \$5 notes of American currency, or 20s. 10d. of English money, and English fractional silver and copper coinage; gold is so rare as to

be something of a curiosity.

No inconsiderable amount of American money is received here quarterly from natives employed in the United States, who take this method of remitting to their families in order to save the cost of bank drafts or postal money orders. These notes are accepted by many of the stores at the full face value of 100 cents, or 4s. 2d. to the dollar, the tradesmen in turn using this American currency for the purpose of remitting to the United States for goods purchased. Hence, for purchasing purposes, the American dollar maintains its full equivalent here.

#### TRANSPORTATION.

The oceanic transportation facilities of the island remain the same as in previous years. The steamships of the English Royal Mail and of the Halifax and West Indian Line run on a regular schedule, which

is rigorously maintained.

Direct communication with the United States continues to be confined to the Quebec Steamship Line, the boats of which run at irregular intervals. As one result, the mail service from the United States is of the most unsatisfactory character, and an improvement is imperatively demanded, as an adjunct to the advance in commercial relations with

our country.

It has frequently happened during the past few months, that mail matter post marked in Washington, New York, and Chicago on a given date, and matter mailed on the same date in the interior of Germany, Austria, and other continental countries and transmitted via New York, has reached here in the same mail bag. In one flagrant instance, two letters mailed on the same date, one in Chicago and the other in Vienna (the latter being in addition held for one week in the New York post-office awaiting the departure of a mail steamer) reached here contemporaneously. In view of the fact that in cabling their orders the local buyers rely largely upon the latest editions of the various price lists or prices current, a more regular and satisfactory mail service with the Republic is an absolute necessity.

At the present time, it is possible to get price lists from London of later date than from the United States, although the length of the voyage is two weeks in one case, as against eight days in the other. It is suggested that additional mails might be dispatched from New York by steamships calling at St. Thomas or Jamaica, and thence brought to the Leeward Islands by the boats of the Boyal Mail, on their weekly

north-bound and south-bound trips.

#### EXPLANATORY.

In the summarized statement of imports annexed, the aggregate value of the goods brought in from the United States is stated at \$220,186.88, as against \$211,896.56 for 1896. The itemized return of values which follows, however, shows a total of but \$182,185.88 for 1897, or a difference between the summarized and itemized reports of \$29,710.68. The apparent discrepancy is explained in the fact that the itemized return gives the face invoice value of the goods in New York, while the summarized

return shows the actual value of the goods when entered at Antigua, with freight and other charges added. In previous years, the net New York cost only has been reported.

HENRY M. HUNT, Consul.

HENRY M. HUNT, Consul.

ANTIGUA, November 18, 1898.

# TRINIDAD.

The commercial conditions have been more or less affected by the revolution in Venezuela, the establishment of a quarantine against Venezuelan ports, and the unsettled condition of the sugar markets. The first two elements influenced the wholesale exporting interests, causing a large stock of goods to accumulate in merchants' hands here. The last condition affected the sugar interest, which is the largest and most extensive of this island.

The quelling of the revolution, withdrawal of the quarantine rules with certain restrictions, a general improvement in the spirit of commercial reciprocity between Venezuela and this colony, and the present strong tone of the sugar market, should have the effect of stimulating business and reestablishing a general state of prosperity.

<sup>&</sup>lt;sup>1</sup> In reply to circular of August 5, 1898.

The unsettled state of trade for the past six months has naturally affected the public credit and consequently reduced the purchasing power of the people. The prospective revival of business will largely relieve this state of affairs. Money can now be had at the usual rates.

#### TRADE JOURNALS.

I forward herewith copy of a trade journal published here, which may afford a source of information to our manufacturers and exporters, as it gives the rates of exchange, the immigration tax, harbor dues, trade allowances, rate of export duty on asphalt, a list of arrivals and departures of vessels with imports and exports, together with comments on the existing conditions of the local markets, and prices. Copies of this journal may be had gratis by addressing the Trinidad Shipping and Trading Company, Limited, and requesting them to forward same by each mail.

#### IMPORTS.

A careful comparison of the statistics for the six months ending June 30, 1898, shows so slight a variation from those submitted last year, that I will not burden this report with a repetition thereof.

#### EXPORTS.

Years.	Sugar.	Molasses.	Rum.	Cocoa.	Coffee.	Cocoanuts.	Asphalt.
1896 1897	Hhds. 63, 946 61, 068	Punch. 12, 101 5, 548	Punch. 1, 201 951	Pounds. 19, 970, 242 19, 984, 665	Pounds. 20, 760 15, 340	Number. 11, 798, 410 9, 559, 098	Tons. 86, 028 111, 173

This table shows a decrease of 2,878 hogsheads of sugar, 6,553 puncheons of molasses, 250 puncheons of rum, 35,577 pounds of cocoa, 5,420 pounds of coffee, and 2,239,384 cocoanuts, while asphalt alone increased in tonnage shipped during 1897.

With a view to furnishing accurate detailed trade statistics, I forward herewith the annual report of the collector of customs<sup>2</sup> for the year

ending December 31, 1897.

#### UNITED STATES MANUFACTURES.

This market having for years been more or less supplied from America, there remains little to be said regarding the advent of new articles. I note the arrival, however, of golf clubs of American manufacture, the finish and quality being excellent, and in some respects superior to those of European make.

#### NEW ENTERPRISES.

In this line, I have only been able to learn of some experimental work by a firm here with a view to refining cocoanut oil so that it will not become rancid from age. Should they succeed, I shall endeavor to report fully on this subject. There has also been incorporated the Trinidad Brewing Company, but at present, it is impossible to give any data regarding the extent of the undertaking. The city of Port of Spain, I

<sup>&</sup>lt;sup>1</sup> Filed for reference in the Bureau of Foreign Commerce, Department of State.

<sup>2</sup> Extracts given at end of report. Original filed for reference in Bureau of Foreign Commerce, Department of State.

am informed, will adopt in the near future a general underground sewerage system. There may then be an opening for American plumbing and sanitary appliances. There is some talk of establishing a shoe factory here, and I believe an agent has been dispatched to the United States with a view to looking into the cost, etc.

#### HARBOR REGULATIONS.

All vessels bringing cargoes to this colony are subject to a tonnage charge of 8 cents per ton in and 8 cents out. Vessels arriving in ballast pay an arrival fee of \$2.40 and 8 cents per ton on outward cargo.

# PARCEL POST.

The recent establishment of a parcel post will undoubtedly have a beneficial effect, as it enables residents here to send to America and secure special goods not procurable here, with a minimum amount of trouble and inconvenience.

#### TRANSPORTATION FACILITIES.

These are ample to meet all demands; steamers, running as per my report of last year, bring goods here, where they are distributed throughout the colony by rail and boats.

#### PACKING AND MARKING.

On this subject, there remains little to be said other than to note comments on packing cotton prints, which will be found under the heading of cotton goods. All other American goods coming to this market are satisfactorily packed, so far as I can learn.

# BOOTS AND SHOES.

American shoes are sold to a considerable extent, but not nearly as largely as might be if goods were made in shapes peculiar to this market. American-made shoes are neater in appearance and wear fully as well as European makes, but few of the Spanish and creole classes buy them on account of the American shapes, which are very different from those they are accustomed to wearing. I would suggest securing samples and duplicating the shapes, which, with the superior finish, appearance, and wearing qualities of our goods, I believe would eventually secure the market here to United States manufacturers.

# COTTON GOODS.

Ducks and twills find a ready sale; the cottons lack a finish peculiar to Manchester made goods. The threads of the Manchester cottons are finer, and the goods are finished with a dressing that leaves them heavy and smooth to the touch, and while the wearing quality is conceded to be no better than that of American makes, they certainly look better and sell better. The same applies to cotton prints, with the additional drawback that the print in the goods does not look as well as those from Manchester; then, again, the patterns of American prints are not bright or varied enough to suit this market, and assorted pat-

terns should be packed in cases, instead of one pattern filling a case. In this connection, I would suggest the procuring of samples and endeavoring to duplicate the quality and finish of popular goods, as buyers here are ready and willing to purchase of American textile makers, and some orders have been taken; but the goods find a slow market, while thousands of cases of Manchester cottons are annually sold. I would suggest to American makers of cotton goods that they correspond with the Philadelphia Museums and secure samples, data, etc.

ALVIN SMITH, Consul.

TRINIDAD, December 20, 1898.

# DANISH WEST INDIES.

# ST. THOMAS.

The United States leads in the aggregate imports at this port, although in dry goods and hardware, the great exporting nations of Europe far surpass us—the logical result of their efforts. In provisions, the merchant of the Danish West Indies have been sought by those interested in American trade, and the great bulk of this trade comes from America. It would be the same with dry goods and hardware, if energy were displayed and an attempt made to obtain the trade. English, French, and German houses have their commercial representatives on the ground to show samples and take orders. The United States is at least ten days nearer to the Danish West Indies than Europe, and with goods equal, and in most cases superior, to those sent here from Europe, the United States ought to lead.

All that is needed to bring about this change is:

First. For the American manufacturer to acquaint himself with what is needed for this climate. It has been said that certain makes of cotton, silk and worsted or woolen goods have been asked from America by merchants here, but could not be obtained. Either the goods were not manufactured, or the merchant here did not know where to send for them.

Second. The American merchant should make arrangements to allow dry goods and hardware samples to be examined and orders taken. With this system, I feel sure that the merchants of the United States would lead those of all others combined in dry goods and hardware, as they now do in provisions; but the market must be sought, and it will be the seeker who will find. Let the United States merchant display his own goods. There is a demand for anything American on the part of masses of the people.

The value of the importations coming into the three ports of entry, St. Thomas, Christiansted, and Fredericksted, during the last year, was \$1,142,038, which shows clearly the importance of these islands to

the dealers in the United States.

MAHLON VAN HORNE, Consul.

ST. THOMAS, October 12, 1898.

## DUTCH WEST INDIES.

Curação, having no interior country or dependencies, can not be counted of great value to our export trade, excepting for the food supply; nor can this be extended beyond the requirements of its population. Most of this supply comes from the United States, as well as carriages, bicycles, and the cheaper class of house furniture, sheetings, prints, and canvas for sailcloth. Fine goods for ladies' wear are chiefly imported from Europe, as is also cassimere for men's garments.

There is no demand for machinery here, as there are no factories,

mills, or railroads.

During the past year, an electric light plant and steam bakery have been installed, the machinery being supplied from the United States.

The present year has been one of great financial distress for Curação. Smallpox in Venezuela has prevented steamers and sailing vessels touching here, with their usual passengers and freight for transshipment, and the two principal sources of income to the merchant and laborer, supplying ships and transferring cargo, have been cut off. The absence of the large number of passengers who usually call here has left all the hotels empty. All the profits resulting from this trade have been lost. Money that was in circulation at the first of the year has been sent away, mostly to pay obligations, and, since none has come in, commerce is in a deplorable condition. In addition to the trade depression, the season has been very dry, but little rain having fallen. The shallow surface wells have dried up; the crop of native corn has been a failure, and many cattle and goats have died on the estates for want of food and water. Had it not been for the many American windmills irrigating the grass fields, the loss would have been much more severe. These mills have been introduced within the past few years, and are doing much good to the dry soil of the island.

L. B. SMITH, Consul.

Curação, November 18, 1898.

#### DECLARED EXPORTS, DUTCH WEST INDIES.

# FRENCH WEST INDIES.

### GUADELOUPE.

The fiscal year in this colony corresponds with the calendar year, beginning January 1 and ending December 31. The accompanying tables, which show, in tabular form, the movement of exports and imports for the year 1897, have just been published. It will be noticed at once that the two tables do not, apparently, correspond in the statement of the amount of native products exported, the detailed statement showing nearly \$300,000 more than the main table. The detailed table evidently contains the reexports, among which is an item of \$176,121.25 in coin.

The most important fact shown by these tables is that the imports are in excess of the exports by the very considerable sum of \$813,824.64. Under these circumstances, it is not surprising that the financial condi-

tion of the colony should be as bad as it is.

It will be noticed also that the great bulk of the exports goes to France or its colonies, the foreign export trade, which includes that with the neighboring English islands, amounting to the insignificant sum of \$6,496. On the other hand, the greater part of the imports comes from other countries than France. Thus, flour and alimentary grains, kerosene, animal products, live animals, and wood, amounting to over \$1,000,000, come chiefly from the United States, while France sends wines, fish, textiles, etc.

From the detailed table, it will be seen that France pays about double the price for coffee, here, that is paid in the other colonies. Sugar is

also heavily protected by bounties.

The sugar crop of this year, just finished, was larger than that of

last year, but no accurate statistics are available.

It is probable that next year will disclose a still greater disproportion between the imports and exports, to the disadvantage of the colony.

Louis H. Aymé, Consul.

GUADELOUPE, August 4, 1898.

### SUPPLEMENTARY REPORT.

I inclose a tabular statement of the exports of products of this colony for the first six months of the current year, as compared with those of the corresponding period of 1897.

Louis H. Aymé, Consul.

GUADELOUPE, August 6, 1898.

Exports of products of Guadeloupe from January 1 to June 30, 1898.

		From Jan. 1 to June 30, 1898.

### FINANCES OF GUADELOUPE.

I submit a further report, in continuance of that of September 24,1

upon the financial conditions prevailing here.

As a basis for this report, I inclose a translation of a long letter of Senator Alexander Isaac, of this colony, addressed to the minister of finance, and which has been published in two numbers of "L'Indépendant," a newspaper published in this city. Senator Isaac rather exhaustively examines some phases of the situation, and his remarks are valuable as coming from one who has sat in the French Senate for nearly a score of years. He very clearly exposes the precarious position of the bank and of the finances of the colony in general.

As the object of the letter is, partly at least, political, a certain ingenuousness in his manner of stating apparent facts may be understood, but requires some comment and explanation. Thus he states that the bank is "in accord with the essential conditions of its fundamental charter." It is well knows that the bank bills are circulating

at a discount and are never redeemed at sight.

Again he draws a comparison, favorable to the bank, of its legal liability limit and actual liability. But the latest monthly statement of the bank shows that the liabilities, October 31, were 16,012,696.72

francs, or within 673,411.68 francs of the limit.

Again, he says that the "fractional currency enjoys the privilege of forced circulation." This is not strictly accurate. The fractional currency does circulate among the people, because it is the only money attainable since the copper coins have been practically withdrawn. But the post-office, the treasury, and all Government offices refuse to receive this fractional currency at all. Thus if a sum has to be paid, say of 8,196.50 francs, the extra 1½ half francs must be paid in copper coin, or in a 5-franc bank bill for which change may or may not be given at the option of the receiving Government officer.

The most interesting thing in the letter, however, is the frank acknowledgment that "the State has been speculating in exchange," and the expose of the deadly "endless chain," by which both the bank and the colony have been deprived, first, of all coin, and second, of large sums

of money.

It is impossible to study the financial question here without taking into serious account the political and sociological conditions prevailing. The race question is the most powerful factor in all the problems of the

<sup>&</sup>lt;sup>1</sup> Advance Sheets, No. 264, November 3; Consular Reports, No. 219, December, 1898.

colony. Both the whites and the blacks are torn by internal dissensions and divisions. Particularly of interest is the animosity existing between the partisans of the sugar manufacturers and their opponents. Each side accuses the other of being responsible for all of the evils which oppress the country, and the only thing certain is that both are selfish in their aims.

They resort to various expedients to hide the fact that they bankrupt. They always make their calculations, for example, in all budgets, estimates, and statements, in coin francs, while for the greater part, the actual transactions are in paper francs at widely varying discounts. Coin francs and paper at all sorts of discounts are added together, and the totals called coin francs.

I have been trying ever since my arrival here to get a plain statement of the actual debt of the colony, but in vain. A debt which is to-day acknowledged to exist you are told to-morrow has disappeared. After strenuous efforts, you will later discover that some resolution has been passed authorizing such and such a department at some future date to ask for a loan from some other quarter, and forthwith the whole transaction is carried from the debit to the credit side of the page. Actual assets and possible future profits are added together and the result treated as an asset in hand, while debts are diminished by hoped-for reductions, and the difference is set down as the extent of the liability. As is plainly to be seen in the senator's letter, there is no contingency so much to be dreaded as a settling up. How long that contingency can be averted is the main problem, and not how to get down to actual business. Meanwhile, certain classes are profiting to make great personal fortunes, and these fortunes are, I am convinced, the secret of the seeming vitality and elasticity of trade with outside countries.

Withal, all classes are dissatisfied. It is gravely questioned whether the bank's charter will be renewed next January for another year. One rumor has it that it will not and that the bank of Indo China will take its place. Others say that within three months, exchange will be as low as 15 per cent, while others predict 40 per cent. I think the lower

figure the more probable.

Louis H. Aymé, Consul,

GUADELOUPE, November 23, 1898.

[Extracts from letter of Senator Isaac, of Guadeloupe; to the minister of finance.]

The difficult position in which the Bank of Guadelcupe for the past three or four years has found itself may be due in a measure to bad administration, but it is above all to be attributed to economic perturbations and to natural circumstances impossible for anyone to have foreseen. This situation is beginning to improve, thanks to the efforts of a new administration, which is manifesting a firm desire to repair past faults. Thus the bank has lately lowered notably, from 35 per cent to 26 per cent, its premium on drafts on Paris. There is reason to hope that it will soon be able to do still better, on condition, always, that the privileges of which it has need shall not be refused it. If it is desired to help it and not to stop its revival, there should not be exacted from it, while it keeps level with its obligations, duties which are beyond its power to perform.

which are beyond its power to perform.

You know, Mr. Minister, the role of our colonial banks. It is they that aid commerce and agriculture in the countries in which they operate; through them long since has there been realized, in the colonies, that agricultural credit—"créditagricole"—which it has been so difficult to introduce in France; without them colonial production, which has no reserve capital, would soon fall to pieces. To enable them to render the services for which they were created the legislator has accorded them the privilege of emitting money, stipulating that their bills should be redeemable at sight to bearer, and in amount should never exceed three times their coin reserve. Up to the present, the Bank of Guadeloupe has been in accord with the essential conditions of its fundamental charter. It possesses actually a coin reserve of 3,081,658 francs. Total bills in circulation, 6,769,025 francs. For its

drafts it has a credit of 5,369,000 francs on the Comptoir National d'Escompte, guaranteed by 3 per cent redeemable bonds-"titres de rente 3 per cent amortissable"which are deposited with the comptoir, and which represent a capital of more than 7,000,000 francs. On June 30, 1898, this credit had been drawn on for 2,074,819.73 francs. The balances being regularly made, the sale of drafts, if nothing new occurs

to prevent, is not therefore menaced.

The law and regulations have fixed for the operations of the establishment a legal debt limit. This limit was, June 30, 1898, 16,686,108.40 francs, while the actual liabilities were 13,090,965.49 francs.

These are not symptoms of a desperate situation or such as should occasion extra-ordinary precautions. Nevertheless, any bank, however well situated, may fail, and it is natural that the State should have exacted guaranties. It exacted such guaranties when it limited to 1,500,000 francs the maximum balance in bills to be held by the treasury. And, on this subject, it may be asked if this credit limit of banks, proportioned, no doubt, to the initial importance of these establishments, is sufficiently in touch with the actual needs of the situation. A circular from the department of marine and colonies of November 24, 1882, thus defines the character and

origin of the limit in question:

"The department of finance considers that there should be chosen, in determining the balance of bank bills to be held by colonial treasuries, a more rational basis than the condition of the total balances of the local treasurers, which in no way depends upon or is connected with the guaranties which the banks should give, or with the amounts of the bills they are permitted to issue. The department believes that in the conditions of the banks themselves, there should be sought the basis for the quantum to be determined, and not in the amount of a continually varying balance, and proposes to fix this quantum at one-half of the capital of these

establishments of colonial credit."

Thus is explained the fixing for the three banks of Guadeloupe, Martinique, and Réunion, of which the social capital is 3,000,000 francs, a common maximum of 1,500,000 francs. But the real situation of a commercial establishment is not determined by its social capital; it seems more natural that it should be measured by its acquired capital represented by certain valuable assets. Now, this latter capital, represented by bonds—"titres de rente"—is not the same for the three colonies. It is 7,000,000 francs for Guadeloupe, 6,798,000 francs for Martinique, and 4,100,000 francs for Réunion. The uniformity sought for by the authors of the instructions is therefore reduced to great inequalities.

It should be added that the adoption of a fixed maximum common to various establishments presents this inconvenience, that it does not take into sufficient account circumstances which, without in any way affecting the solidity of a bank, may accidentally, as we have lately seen, cause its bills to flow into the treasury. It would surely be more reasonable that the capital in bonds should be taken as the basis on which to calculate the maximum in paper, as has heretofore been adopted, as witness the accounts of the committee of surveillance for the fixing of the legal limit of debts by application of the law of June 24, 1874, article 4, section 6, and of the decree of April 15, 1863. These remarks find place here naturally, and the existing facts do not make them untimely. There is nothing to indicate, in fact, that the guaranties of the State have in Guadeloupe undergone any diminution.

The law desires, no one denies it, that the holders of the bills should have the right to demand redemption thereof at eight, but it is also undeniable that bank institutions can not operate unless this right is exercised with the greatest of moderation. Should it happen that the bill holders, either being doubtful or with speculative views, should rush to the bank, demanding the redemption of their bills in coin, unless some limit was opposed to their demands, disastrous liquidation

would ensue in 48 hours

Such an event would be of the gravest danger in a small country, and because the Government understood this it created the fractional currency issue, the object of which is to protect the statutory coin reserve of the bank against redemption demands against it in times of financial crisis, when otherwise it would be utterly exhausted. This fractional currency enjoys the privilege of forced circulation, as was formally decided by a decirion of the court of Guadeloupe May 26, 1897, and

can be issued in redemption of bills.

\* \* All of the difficulties owe their origin, in great part, to the fact that the State has been drawn, probably by force of circumstances—I am not recriminat-

ing-into speculating on exchange.

Our colonies are not the only ones that have been touched by this crisis; the British possessions, to mention these only, have been equally hurt, and the English Government has seen the need of coming to their aid with powerful subsidies backed by important reorganization. Under the circumstances, it is intolerable that our colonies should be exposed through simple matters of bookkeeping to an aggravation, irreparable perhaps, of the difficulties through which they are struggling.

### IMPORTS INTO GUADELOUPE.

Through the kindness of the principal Government broker here I have been able to construct a comparative table of imports, from the United States for the past five years. From this table it can be seen that since 1894, and particularly during 1898, there has been a decline in imports of live animals, beef, biscuits, butter, corn, flour, hams, herring, lard, lumber, and pork. These diminutions in amounts are not due to competition by France or other countries, but represent an actual decline in amounts consumed, due to the impoverishment of the country. But three articles show an increase—beans, pease, and shooks. The first two articles were for years supplied by France, but the competition of the United States, furnishing better beans and pease, and at a lower price, transferred the whole trade to the United States. The increase in the imports of shooks is readily understood.

It is also to be noticed that nothing, practically, but food stuffs is imported; no textiles, machinery, or manufactures of any kind. All of this is due, as I have frequently reported, to the extraordinary political, social, and financial conditions prevailing here. Of late, these have

been still further emphasized for the worse.

The figures in the table are not, it is true, official, but I have no reason to doubt their accuracy. In view of the decided hostility to American goods, it is surprising that the decline has not been greater, and this is an additional proof of the high character of our goods.

LOUIS H. AYMÉ, Consul.

GUADELOUPE, January 14, 1899.

## MARTINIQUE.

The trade movement of Martinique during 1897 was depressed in comparison with that of 1896. Statistics show a great diminution in both exports and imports, the latter far exceeding the former.

The demoralized condition of trade in general was brought about mainly by the poor prices obtained for sugar, the second principal export to rum, and the diminished demand for the latter. The first six months

<sup>1</sup> In response to circular of August 5.

presented an alarming state of affairs, the Bank of Martinique refusing to advance loans to the planters, as was previously done, with a lien upon their first crops. This action might have resulted in a panic, but for the timely intervention of the authorities. As it was, many planters became insolvent. Upon the 7th of April, the French Government decided to pay a bounty upon sugar exported from Martinique, but it was some time before this measure had its effect, and the entire year of 1897 was marked by a deplorable condition of affairs.

The commercial intercourse between the United States and Martinique is confined almost entirely to food stuffs, which have the benefit of a special and exceptional tariff, brought about by the fact that this island is so far removed from its mother country and so near to the United States, that it looks to us for food to a great extent. The articles on which we are given the benefit of the minimum tariff are canned meats; fruits, fresh or in their natural state; common wood, rough, squared, cut; sawed woods (undressed), staves, coal, apples, pears, and mineral oils. The following articles, included under the head of food stuffs, are specially admitted: Salted and pickled pork and beef in barrels, smoked meats and tongues, flour, biscuits, meal, corn, lard, lumber, rice, pine, kerosene, coal, staves, fertilizers, rum and sugar shooks, and matches of wood or other substances.

Formerly, there were certain classes of dry goods, calicoes, drillings, long cloths, etc., imported from the United States, but they were not adapted to local tastes, and since no efforts were seemingly put forth by our manufacturers, this trade was transferred to the English and French, who paid particular attention to the local desires. The duty on this sort of goods imported here from the United States is extremely high, being 60 to 80 per cent of value based upon maximum tariff, while England pays but an average duty of 50 per cent based on minimum

privilege, and France but an octroi duty of 6 to 8 per cent.

The high rates of duty levied here on most goods from the United States, whether from a minimum or maximum standpoint, are not bene-

ficial to Martinique, which has no manufactures to protect.

Agricultural implements were, before the general tariff took effect, imported from the United States in considerable quantity, but at present, this line has greatly decreased, owing to the enormous duty. France and Belgium import them here, the latter country enjoying the minimum duty. Carriage fixings are almost wholly imported from the United States, even under the high duty. Sewing machines are imported to some extent, and the American machines are popular; yet of late there seems to have been a deviation, and the French machines worked by the hand are more employed. Bicycles are used but little, the roads being too rugged. American wheels are preferred, but their importation suffers from the high duty, which is almost prohibitory.

There is no doubt but that American manufactures are handicapped by the high tariff levied upon most of our importations, and it seems that a broad commercial treaty between France and the United States, in which Martinique and the other French colonial possessions shall be included, is the only way for our manufacturers to gain a foothold here. When such a treaty is made, it behooves our manufacturers to follow closely the methods of Europeans, who take pains to please and to make their presence felt. The American manufacturers who have done business in this island have no doubt been lax about some things—their agents in most cases not being able to speak French and the circulars being in English, which is not understood to any great extent here. On the other hand, foreign manufacturers send agents who speak the language, and their circulars are printed in French.

#### CURRENCY.

The currency in use here is very poor, the paper money being flimsy and poorly printed, while the metal money (outside the small amount of gold in circulation) is of copper and nickel, 600,000 francs of the latter being introduced in November, 1897. This money is purely colonial, and will not pass in Guadeloupe, the nearest French island colony. United States gold calls for a premium, ranging from 10 to 17 per cent, plus the par value of \$1 at 5 francs 25 centimes.

#### PORT REGULATIONS.

In port charges, there is no discrimination as to nationality, and they are about the same for both the ports of Fort de France, the capital, and St. Pierre, the commercial center. The rate is:

Stamp on inward manifest.  Permit to load and unload  Passport.  Sanitary dues, per ton  Moorage dues, taking lines ashore (optional)  Water tax, per ton	\$0.05 .95 1.15 .03 4.80 .02
- Navigation dues.	
Pilotage for vessels inward and outward:  150 or under 200 tons.  200 or under 250 tons.  250 or under 300 tons.  300 or under 350 tons.  350 tons and upward.  Lighterage dues, per vessel  Buoy dues, per ton.  On pilotage or lighterage dues and buoy, 10 per cent additional charged, called navigation dues.  Stamp for outward manifest and clearance, per vessel.	19. 05 22. 48 25. 68 29. 15 3. 80 . 02
Interpreter's fees.	
150 or under 200 tons	\$7.64 9.55 11.48 13.32 15.24

The rules of the principal ports of Fort de France and St. Pierre are about the same as are those of the minor ports of Francois, Trinity, Simon, and St. Marie. The entering and departing vessels are under the supervision of the harbor master. Pilotage is obligatory when the vessel comes from a foreign port, but not when going from colonial port to port.

Quarantine is strict when vessels come from an infected port and lasts from fifteen to twenty-three days, providing no new cases appear. When the case is serious, the vessel is sent to the "lazaretto" at Pointe de Bonte, at the south of the island, across the bay from Fort de France, where the cargo is discharged, fumigated, and the passengers, if any,

placed under supervision.

The harbor of Fort de France is

The harbor of Fort de France is better than that of St. Pierre, being almost landlocked. There is a dry dock 393 feet in length and 419 feet at the exterior groove, with a width of 111½ feet. Length of blocks, 360½ feet; draft of water above the line of the tub, 24½ feet. There is a movement on foot by the authorities to enlarge the dock.

#### COMMUNICATION.

There is a telephone system on the island, the principal line being from St. Pierre to Fort de France. Two cable lines have stations here, the West India and Panama Telegraph Company, Limited, and the Compagnie Francaise des Cables Telegraphiques; the former reaching New York via St. Croix, Jamaica, Bermuda, and Halifax, while the latter's connection with New York is via Haiti.

Regarding transportation conditions, the steamers of the Quebec Steamship Company, the Compagnie Générale Transatlantique, and the Royal Mail Packet Company call twice every month at Martinique, while small vessels visit the different ports of the island, carrying commodities. Between Fort de France and St. Pierre the small steamers of the Steam Yacht Company make daily trips, carrying passengers and commodities. Merchandise to be transported to the interior is carried by small carts, donkeys, and upon the heads of men and women. There are no railways in Martinique, with the exception of a small tramway at St. Pierre.

Passports are not required from persons coming to the island, and they are not molested. Goods coming from foreign countries are not required to show country of origin.

GEO. L. DARTE. Consul.

ST. PIERRE, October 1, 1898.

### SUPPLEMENTARY REPORT.

Mr. Testart, acting vice-consul at St. Pierre, writes under date of December 26, 1898:

I transmit statistics for the first six months of 1898, which reached this consulate only a few days ago; also those for the last six months of 1897.

The imports from the United States for January 1, 1898, to June 30, 1898, show more favorable results than those for the last six months of 1897, the cause of which may be assigned not only to the opening of the sugar-crop season, when stores and shops on the large sugar estates have to be replenished, but also on account of the consumption being more active than during the latter part of the year, when exports are reduced to a minimum.

The statistics alluded to show the principal items imported from the United States, with their quantities and values, as well as the total imports and exports from this island, and the shipping for the last six months of 1897 and first six months of 1898.

I may add that the course adopted by the new director of the Martinique Bank has caused, in an indirect way, a certain impetus to trade. Previous to his arrival, drafts were sold bimonthly, and limited amounts drawn on each occasion. Fifteen per cent premium was paid by purchasers of 90 day sight drafts; the consequence was a restriction of the imports. The new director immediately put the premium at 10 per cent, and subsequently at 8 per cent. In my opinion, there will be a further decline in premium when the sugar crop commences.

Another change has been brought about by the same manager, since the early part of December, by the emission of checks for large and small amounts to suit the wants of the people, and a proportionate premium is paid as follows:

	~~~
For 60-day sight checks	. 81
For 30-day sight checks	9
For sight checks	91
Digitized by GOOGLE	. • •

Ninety-day sight drafts are issued, as before mentioned, at 8 per cent. These checks are drawn, according to the desire of the purchaser, on the "Comptoir National d'Escompte," at Paris, and on its various branches in all the departments of France.

These checks could formerly be obtained only from the national treasury, in the form of post-office money orders on the chief department of the post-office, at Paris, and commanded 3 per cent above the bank rate

on 90-day sight drafts.

On January 4, 1899, Mr. Testart adds that the Bank of Martinique has reduced the rate of premium on 90-day sight drafts, on Paris, from 8 to 6 per cent. The rate of discount, on the other hand, has been increased from 6 to 7 per cent.

Imports for the last six months of 1897.

### TRADE OF MARTINIQUE IN 1898.

I forward statistics on the exports and imports of Martinique for the

year ended December 31, 1898.

In the first table will be seen a decrease in the native staple export, that of sugar, to an extent of 3,264,834 kilos (7,182,636 pounds). The decrease of the past year is attributed to the diminution in cane cultivation, occasioned by the continued low prices upon the European markets during the year of 1897. The same conditions have existed at Guadeloupe, the sister island.

The total general imports have also suffered a decrease, as well as

the total general exports.

The commercial movement (inward) of the island shows an increase in value of imports and an increase for 1898 over 1897 of imports from the United States, amounting to 882,594 francs, or \$168,113; the commercial movement outward shows an increased aggregate of exports for 1898 to foreign countries other than the United States, but a decrease in the exports to the United States equivalent to 3,028,257 francs, or over half a million of dollars.

Regarding the maritime movement (inward) for 1898, a decrease is

shown in the total number of vessels.

The last table, showing exports from the United States to Martinique of food stuffs, is for the city of St. Pierre only. The total of the island I have been unable to obtain up to the present time.

The council general has restored the export duty on rum to one and

one-tenth centimes per liter.

GEO. L. DARTE, Consul.

### SANITARY DUES AT MARTINIQUE.

I send translation of the changes that have occurred in the collection of sanitary dues in this island, in virtue of the decree of June 16, 1898, as follows:

The council general of Martinique, acting in virtue of the powers conferred by article 93 of the decree of March 31, 1897, makes the following decision:

ART. 1. From and after January 1, 1898, the sanitary dues will be collected in the

island as follows:

a. Recognition dues, on arrival, without distinction of nationality: Ships plying coastwise, per net ton register	<b>20.009</b>
Ships plying between the islands	
Ships or seagoing vessels	
Steamers calling at different ports of the island:	
For each passenger embarking or disembarking	. 193
Per ton of goods landed	. 028
Horses, mules, oxen, etc., will be counted at the rate of 2 tons per	
head; 2-wheel carriages at 3 tons; 4-wheel carriages at 4 tons.	
b. Harbor dues payable by ships in quarantine, per day and per ton	. 005
Ohine which against the conitant condition of the island discharge their	

Ships which, owing to the sanitary condition of the island, discharge their cargo without communicating with the shore, and ask for sanitary guards, so as to obtain a certificate of noncommunication, will have to pay, in excess of the aforementioned dues, the wages of the sanitary guard stationed alongside the ships.

c. Maintenance in sanitary stations and lazarettos, per day and per person: First class	<b>\$</b> 0.386
Second class	. 193
Third class	^^~

<ul> <li>d. Disinfecting dues:         <ul> <li>(1) Disinfection of dirty clothes, wearing apparel, ship's bedclothes,</li> <li>and all other articles of luggage considered as contaminated:</li> </ul> </li> </ul>	
Per first-class passenger	\$.193
Per second-class passenger	.096
Per third and fourth class passenger	. 048
Per sailor (officers included)	. 048
(2) Disinfection of merchandise:	
Disinfection applied on board ships, per ton register	. 009
Goods landed for disinfection:	
Merchandise packed, per 100 kilos	. 096
Dry hides, per 100 pieces.	. 193
Small hides, unpacked, per 100 pieces	. 096
(3) Disinfection of rags and drills, per 100 kilos	. 096
(4) Ship's disinfection, for the entire ship, per registered ton	. 003

If disinfection is only for the contaminated portion of the ship, the charges are reduced to half. The charges for disinfection, as stated in paragraphs 1, 2, and 4, hereabove mentioned, can be reduced to half if the ship, having on board a sanitary officer appointed and accepted by the government of the country to which the ship belongs, and a disinfecting apparatus the security and efficiency of which have been proved, can prove that all sanitary and disinfecting measures have been regularly applied during the voyage, according to paragraphs of Title V of the decree of March

31, 1897, on marine sanitary police.

All sanitary charges have to be borne by the shipowners. Charges made either for handling and transportation or for the application of chemical disinfectants are also to be borne by the shipowners; in case of rags and drills, the charges, according

to custom, are borne by the owners of the merchandise.

ART. 2. Ships plying around the island, mail steamers of the Compagnie Transatlantique, of the Royal Mail, and other steamers which may in future be recognized as mail carriers by the French Government, are exempt from the charge of recognition.

ART. 3. Ships that have paid the charge of recognition in one of the ports of the

island are exempt from any further charges, on entering other ports during the course

of the same trip.

ART. 4. Soldiers and sailors, children under 7 years of age, indigents sent off at Governmennt expense or through orders from consuls, are exempt from sanitary dues.

ART. 5. Ships that call in the same port more than once a month may enter into

contract, so as to pay a subscription fee of 50 francs (\$9.65) per month.

ART. 6. Are exempt from all sanitary charges mentioned in the preceding paragraphs:

(1) Men of war and ships belonging to the several services of the State.
(2) Ships in distress, provided no sanitary regulations are applied and they do not

effect any commercial transaction while in the harbor.

ART. 7. The payment of the sanitary dues mentioned in Article I, under headings A and B, is confided to the care of the customs authorities

The other sanitary dues are collected as provided in Chapter VII of the local decree of July 6, 1897.

A. TESTART, Vice-Consul.

MARTINIQUE, October 25, 1898.

# HAITI.

### GENERAL REPORT.

I transmit herewith my annual report for the year 1897-98, with reports from Aux Cayes, Jacmel, and St. Marc.

### COMMERCE.

I can add but little to what has already been reported on the subject of United States trade with this country, its possibilities and drawbacks. I think, however, that the greatest obstacle to the development of the trade between the two countries lies in the indifference shown by our manufacturers to the desires of the people of this country. The tastes

of the Haitien people differ from those of the South Americans and inhabitants of the other West Indies, even from those of Martinique and Guadeloupe, although the same language is spoken. Our manufacturers should not fail to note the preference for certain colors and patterns of cotton goods, and the manner of putting them up for greater facility in handling by the retailer. Another fact that is often overlooked is that the French language is the one in common use here; therefore all catalogues, descriptive circulars, etc., should be in that language.

The total value of importations for the fiscal year ending September 30, 1897, was \$5,475,138.49, divided among the different nations. of

which the United States leads, as follows:

United States.	<b>\$3, 489, 988. 86</b>
France	942, 683, 47
Germany	<b>529, 259. 27</b>
England	309, 230. 00
Other countries	203, 976, 89

It is to be observed that while the importations from France for the past year have fallen lower than during any period since 1890, those from England and Germany have gained notably.

The American trade in the hardware line is being slowly supplanted

by the German trade.

Our provision trade holds its own. I note with satisfaction a new departure made by a New York house in catering to the taste of this market, in the line of table butter. The day may not be far distant when the American article will supplant the Danish, to which it is much superior.

The accompanying table will show the quantity of the principal pro-

visions imported here during the year ending June 30, 1898.

Coffee.—Uoffee being the principal article of export, it is but natural that the heavy decline in the price during the past two or three years in the European market should be felt here, notwithstanding the fact that the crop of 1896-97 was excellent, yielding about 75,000,000 pounds. To this decline may be attributed the severe financial distress, that has for the past few years produced such disastrous effects on the trade. A severe drought also has visited several sections of the country during the past two or three years.

Of the 75,000,000 pounds of coffee exported, 9,322,427 pounds have been shipped to the United States, representing a value of \$1,005,397, nearly equaling the importation from that country during the same

period, which amounted to \$1,276,684.

The coffee crop of 1897-98, it is estimated, will give 60,000,000 pounds, of which there had been exported up to June 30, 1898, but 14,990,734 pounds. The very low prices (falling at one time as low as 36 francs and averaging 46 francs per 100 pounds) has caused exporters to hold back, hoping for a rise.

#### INDUSTRIES.

This is essentially an agricultural country, but cultivation is carried on in a very primitive and imperfect manner. The commonest of our improved agricultural implements are unknown. There is a wide field here for extension of agriculture and stock breeding.

There is also an excellent opening for American capital in the proposed railways. German capitalists have succeeded in supplanting,

more or less, the French and English, and are striving hard to monopolize the field.

The working of the various mines of coal, copper, and iron with improved machinery would, I think, yield good returns to capital invested.

JOHN B. TERRES, Vice-Consul-General.

## AUX CAYES.

I give below a detailed statement, showing the imports from the United States to this port, and a detailed statement of the exports

from this port.

Business in this island during the past year has suffered a great deal owing to the financial crisis which has now been existing for nearly two years. Imports and exports have greatly decreased with the violent fluctuations of exchange. The value of the staple articles of export—coffee and logwood—have depreciated in the European and American markets, and this has also been one of the chief causes of the continuation of the crisis in the country.

The law re judicial liquidation passed two years ago has been greatly misinterpreted, and a great deal of harm has thereby been done to the credit of the country, and European and American firms have had

severe losses to sustain through its execution.

Exports from Aux Cayes from July 1, 1897, to July 1, 1898, were as follows: Coffee, 55,232 bags, weighing 7,935,554 pounds; logwood, 5,056,000 pounds; hides, 80 bundles, weighing 12,687 pounds; copper, 13,590 pounds; wax, 806 pounds; and tortoise shell, 127 pounds.

With the exception of some of the coffee, exports have gone to the United States, where the market was better than in other countries.

Goods imported into Aux Cayes from the United States from July 1, 1897, to July 1, 1898.

H. E. ROBERTS, Consular Agent.

AUX CAYES, August 17, 1898.

#### JACMEL.

I give below statement of exports and imports of the port of Jacmel during the year ending June 30, 1898. This report shows that, whereas the quantity and value of produce exported has not varied much during the past two years, the imports of goods of all sorts has decreased as much as \$230,000. This is chiefly owing to the difficulty in obtaining credit abroad, on account of the prevailing commercial crisis. In

addition to this, the gradual fall in value of coffee and logwood shows that an early improvement in the affairs of the country is hardly to be expected.

The imports of dry goods amounted to \$103,665.21; provisions from

the States, \$218,434.94; a total of \$322,100.15.

The exports were: Coffee, 12,918,309 pounds; logwood, 1,000,000 pounds; goat hides, 3,802 pounds; orange peel, cotton seeds, 29,630 pounds, and shells, 327 pounds, of the value of \$1,708,150.60.

J. B. VITAL, Consular Agent.

JACMEL, December 21, 1898.

## ST. MARC.

There has been no notable change in commerce during the past year.

Conditions, instead of improving, have grown worse.

Last year at this time, the principal exports were quoted at a good price on the European markets, and it was hoped that the withdrawal of paper money would bring confidence and benefit trade, but owing to the low prices of coffee and the high duties imposed upon it, the difficulties of the withdrawal of paper money would be felt.

The crop in my district is abundant this year, and the quality is good.

The greater part of business here is done with the United States,

and provisions are the principal goods imported.

This year, all the logwood and roots have been shipped to Europe, where the prices are much higher than in the United States. Since the month of January, there has not been one sailing ship under the American flag taking logwood or roots. The Haitian brig *Union* has been the only ship that cleared for the United States, in January and June, with less than 500 tons of wood for the two trips together.

Cotton and coffee are generally shipped to Europe.

CHARLES MIOT, Consular Agent.

ST. MARC, August 2, 1898.

## CAPE HAITIEN.

Replying to Department circular dated August 5, 1898, I submit the following report, with the accompanying statement of exports and imports for the consular district of Cape Haitien, including the consular agencies of Port de Paix and Gonaives. As bearing upon this report and embracing matter called for in the circular referred to, I beg to call

attention to reports from this consulate, dated respectively July 16,

1898, and August 20, 1898.1

The general course of trade here and the needs of the market have been so well stated in the reports from Port au Prince and from this district, published in Commercial Relations of the United States, 1896 and 1897, Vol. I, pages 747-760, that I do not deem it worth while to recapitulate. There are, however, a few facts omitted and some new features arising from later conditions, that may be both interesting and useful.

#### CURRENCY.

Probably, the greatest disturbing element in the business world here, and in many respects the most serious problem the merchants and indeed the Government of Haiti have had to grapple with, has been the wonderful elasticity of the currency. The fluctuations began about March, 1896, with the death of President Hyppolite. The premium on gold varied from 20 per cent to 27 per cent until May 12 of that year, when it rose to 30 per cent. On June 1, it was 40 per cent. In July, it rose as high as 58 per cent, but in December declined to 43 per cent. It steadily advanced during the early months of the year 1897, rising as high as 83 per cent in June, declining again until November, at the end of which month it was 88 per cent. It rose to 92 per cent by the end of December; during January, 1898, it varied between 89 and 110 per cent, falling to 95 per cent by the end of the month. Now began a steady and rapid rise. On February 9, it was 105 per cent, but by March 12, it had bounded to 175 per cent, reaching the high-water mark of 205 per cent at the end of April. By the end of May, it had declined to 190 per cent, and was down to 145 per cent at the end of June. A law passed in September of the present year, authorizing the negotiation of a loan for the purpose of retiring the paper currency, and the belief in the ultimate success of the undertaking, have caused a gradual decline in the premium to about 100 per cent, where it is practically stationary at this writing.

#### IMPORTS AND EXPORTS.

The chief articles imported into this district from the United States are flour, pork, codfish, bloaters, butter, alewives, cheese, onions, lard, tobacco, kerosene, blue denims, checks, and cotton. The American denim has proven its superiority to all others, and has almost exclusive command of the market. American axes are preferred by the logwood cutters in the vicinity of Port de Paix. Better prices in Europe stimulated, to a considerable extent, the cultivation of cotton in the plains about Gonaives. In addition to the articles mentioned in the accompanying statement, small quantities of wax, molasses, goatskins, and tanned leather are exported. The apparent discrepancies in the figures referring to logwood and logwood roots may be due to the greater or smaller quantities of straight wood reported from the agencies, which is not only more valuable than the roots, but carries a heavier duty. Both the logwood and the coffee obtained in the vicinity of Gonaives are said to be of superior quality, and command better prices than those exported from other parts of the district.

LEMUEL W. LIVINGSTON, Consul.

CAPE HAITIEN, November 20, 1898.

Printed in Advance Sheets Nos. 184 and 231 (Aug. 4 and Sept. 28). Consular Reports Nos. 216 (September, 1898,) and 218 (November, 1898.)

Merchandise exported from and imported into the consular district of Cape Haitien, including the consular agencies of Port de Paix and Gonaives, for the six months ended June 30, 1898.

## COMMERCE.

The exports of the four leading articles from this consular district for the six months ended June 30, 1898, exclusive of exports to the United States, and also for the six months ended June 30, 1897, were:

	Sugar.	Tobacco.	Cacao.	Coffee.	Value of exports.
Santo Domingo	Pounds. 12, 890	Pounds. 3,500 15,800	Pounds. 288, 464 1, 789, 473	Pounds. 498, 295 240, 848	\$101, 088. 40 855, 454. 00
Total	12, 890	19, 300	2, 027, 937	789, 143	456, 542. 40
Santo Domingo	11, 460	3, 000 329, 900	105, 874 1, 646, 719	691, 789 290, 980	140, 137, 68 253, 606, 82
Total	11, 460	332, 900	1, 752, 593	982, 769	393, 744. 00
Difference	1,430	313, 600	275, 344	243, 626	62, 798, 40

From an analysis of the above figures, it will be seen that in the first six months of 1898, the exports amounted to 2,799,270 pounds, valued at \$456,542.40, and for a like period of 1897, to 3,079,722 pounds, valued at \$393,744, a difference in weight in favor of 1897 of 280,452 pounds, with a difference in value in favor of 1898 of \$62,798.40. I have been unable to obtain the separate values of the above exports; but with 313,600 pounds of tobacco and 243,626 pounds of coffee in favor of 1897, and only 1,430 pounds of sugar and 275,344 pounds of

<sup>&</sup>lt;sup>1</sup> In compliance with Department circular of August 5.

cacao in favor of 1898, it would seem that the latter article must considerably lead any other in value.

From Macoris and Azua, the other two ports of this consular district, there were no exports of the above articles for the periods covered in the foregoing except to the United States.

#### IMPORTS.

The following are the imports of the several ports of this Republic for the six months ended June 30, 1898, and also for the six months ended June 30, 1897, values only being given, and those from Europe and the United States compared:

	Europe.	United States.	Other countries.	Total.
1898.				
Santo Domingo	\$129, 880, 00	\$210, 404, 43	\$4, 978, 53	\$345, 262, 96
Puerto Plata	74, 484, 75	83, 639, 79	2, 805. 50	160, 930, 04
Monte Cristi	2, 547, 02	12, 413, 38	2, 787, 60	17,748,00
Sanchez	139, 170, 17	55, 126, 02		194, 296, 19
Samana	4, 737, 12	14, 689, 64	4, 616, 89	24, 043, 65
Macoris		164, 301, 78	8, 684, 22	191, 881, 05
Azua		46, 716. 11	·i	46, 716. 11
Total	869, 714. 11	587, 291. 15	23, 872. 74	980, 878. 00
18 <b>97.</b>				
Santo Domingo	12, 774, 71	186, 187, 30	31, 693. 30	230, 655, 81
Puerto Plata.		102, 949, 44	4, 288, 44	187, 722, 88
Monte Cristi		24, 172. 02	3,200.22	28, 379, 10
Sanchez		60, 741, 65	1, 081, 89	112,015,19
Samana		7, 563, 89	652.00	9, 605, 89
Macoris		200, 377, 16	4, 991, 03	234, 164, 02
Asua		18, 768. 82		18, 768. 82
Total	177, 934. 27	595, 760. 28	42, 706, 66	816, 401. 21

For the above figures, including those relating to exports, I am indebted to His Excellency, President Heureaux, and his courteous auditor general, Señor Don Hipolito Billini.

Adding the two half years together, we may make a fair estimate of the annual imports of the Republic for the year 1897-98, as follows:

	Europe.	United States.	Other countries.	Total.
1898 1897	\$369, 714, 11 177, 934, 27	\$587, 291. 15 595, 760. 28	\$23, 872. 74 42, 706. 66	\$980, 878, 00 816, 401, 21
Total	547, 648. 38	1, 133, 051. 43	66, 579. 40	1, 797, 279. 21

From the above figures, it will be seen that the United States leads all Europe in its annual exports to this Republic to the value of \$636,403.05, and all the world for more than half a million dollars. Its exports to this Republic for the year 1896-97 were \$1,098,635, which showed a gain of about \$30,000 over the previous year. If the above estimate for the year 1897-98 be correct, it will show a gain of \$84,416.43 over the preceding year.

This showing must be very gratifying to our merchants, especially when it is noted that the languages of the island are both continental, and but very few speak English; yet, I feel certain that by a little more energy and tact, the showing can be considerably bettered, even under present conditions. As might be supposed, large quantities of drills and cotton goods are used here, coming from England and the United States, but the greater part from England, mainly because of cheapness. The American grades, though better than their British rivals,

Digitized by GOOGIC

are dearer; and cheapness, without regard to ultimate economy, seems to give to its possessor superior advantages in the struggle for the markets of tropical countries. Certainly, the shrewdness of our manufacturers will enable them, without stronger hint than is here given, to overcome the disadvantage against which their goods now contend in this market.

Wardrobes, chairs, and settees are the principal articles of household furnishings here, and in this line of goods, which now comes mostly from Europe, I am quite sure our manufacturers could, by a little effort, largely increase their sales. A very large majority of the provisions now come from the United States, and with Porto Rico in our possession, and our wholesale merchants well established there, it would seem an easy matter for them to control this branch of trade. The distance between the nearest coast lines of Santo Domingo and Porto Rico is only about 60 miles, while the distance from New York to Santo Domingo is about 1,200 miles. The same reasoning might apply to other branches of trade, especially general dry goods and hardware, as the habits and customs, likes and dislikes, wants and necessities of the Porto Ricans and Dominicans are very similar, and these can be better known and more readily supplied by our future wholesale Porto Rican merchants than they now can by New York dealers.

#### INDUSTRIES.

The production of sugar is the leading industry of the Dominican portion of this island. There are seventeen sugar estates in this consular district, and the cane of this year's crop is exceedingly good, which, together with an increased acreage, promises an increase of output over last year of from 8,000 to 10,000 tons. Last year's crop produced a little over 48,000 tons, and the crop now ripening is estimated to produce 58,000 tons. Eight of these sugar estates are owned by Americans, six by Italians, one by Germans, one by Porto Ricans, and one by Americans, Englishmen, and Italians.

Tobacco is grown quite extensively in this consular district, and it is said to be of a quality nearly equal to the celebrated Havana product. Nearly all of the tobacco is grown in the interior and formerly passed through this city but owing to competition of the railroad from Santiago to Puerto Plata, on the north coast, a large amount has been diverted to that port. Germany seems to be the chief market for this product.

The cacao crop, which has been rapidly increasing for the last ten years, has not failed this season in its annual augmentation, but promises to surpass former records. During the six months ended June 30, 1898, there were shipped from the port of Sanchez 18,887 bags of cacao, all for Europe, and 1,286 bags of coffee for the same market.

The banana industry is also a growing one. The Samana Bay Fruit Company, whose plantations are near Sanchez, is meeting with deserved success. Its steamers make from three to four trips per month, carrying each trip from 15,000 to 18,000 bunches of bananas to the States. These bananas are of superior quality and command the highest prices in our markets.

Mahogany, lignum-vitæ, logwood, honey, wax, hides, bananas, and sugar are exported chiefly to the United States, the latter two exclusively. Coffee, cacao, and tobacco find a market in Germany and other European countries.

Notwithstanding the instability of the currency and the high rate of exchange (now 200 per cent), the commerce and industries of this

Republic are in a fairly prosperous condition. It is believed that the rate of exchange will decline considerably when the sugar season opens, as a large amount of current money will then be required.

Nearly every mail from the United States brings to this office private letters of inquiry as to the size, population, government, climate, products, etc., of this island, hence the following general observations:

The island of Santo Domingo, which includes Haiti, has an area of 28,000 square miles, with a population of 1,200,000. It lies about 70 miles to the southeast of Cuba, with the Windward Passage between, while to the east is the Mono Passage. In area, the Dominican Republic comprises about two-thirds of the island, leaving to Haiti about one-third. In population these proportions are reversed.

Referring now to this Republic, the population is much mixed, Spaniards and those of mixed blood being largely in the majority, at least

in the cities and towns.

The government is republican in theory and is patterned somewhat after our own; but in practice differs materially in respect to the influence and power of the executive, which here seems to control rather than to advise or suggest legislation. Its laws conform, in the main, to the Code Napoleon. The people generally respect and obey the laws. High crimes, such as murder, arson, burglary, and the like, are seldom committed, and Judge Lynch has never held a session of his court here.

#### CLIMATE AND PRODUCTS.

The climate, though tropical and warm, is generally healthy; the soil of the mountain slopes and valleys is uniformly rich and productive. The natural resources of the country are vast and varied, and its products may be increased with scarcely any other limit than labor expended in that behalf. There is evidence of mineral wealth in various parts of the island. Iron ore is abundant and easy of access. A large quantity, recently taken from a mine near by, now lies at the wharf in this city, and from its appearance I would take it to be of the very best quality. Gold has been found in considerable quantity recently, and it is said that many years ago, the mines were extensively worked. From what I have seen of the samples recently taken from "washings," I believe that patient exploration by practical miners would yield a rich reward. Petroleum has been found near the port of Azua, and is believed by many to exist in paying quantity.

C. L. MAXWELL, Consul-General.

Santo Domingo, November 1, 1898.

#### DECLARED EXPORTS-SANTO DOMINGO.

# SOUTH AMERICA.

## ARGENTINE REPUBLIC.

#### BUENOS AYRES.

I am in receipt of a circular from the Department of State, dated August 5, 1898, instructing me to report on the commerce and industries of my consular district, and herewith transmit the following statistics and the data therewith connected:

Import and export for 1897.

	Imports.	Exporte
rmany	\$11, 114, 102	\$14, 047, 1
est Indies		296, 8
gium		8, 934, 8
Ivia		852, 5
ile		1,977,8
ited States		8, 321, 6
ain	3, 245, 646	1, 271, 1
ly	10, 943, 038	3, 964, (
ince	11, 019, 576	2, 299, 0
lland	80, 055	33, 6
aguay	1, 457, 327	159, 0
rtugal	71,588	19, 5
ited Kingdom	36, 392, 057	12, 984, 6
nguay	505, 170	2, 586, 2
rious ports	] 199, 196	7, 369, 9
pments for order		7, 165, 9
idry imports	4, 761, 505	
Total	98, 288, 948	101, 169, 2

The imports and exports for first six months of 1898 were distributed as follows:

Countries.	Imports.	Exports.
Germany	\$5, 703, 859 15, 514	\$13, 159, 97- 95, 130
Belgium	4, 700, 491 26, 325 2, 493, 410	8, 719, 56, 351, 19 3, 057, 57
Chile	33, 873 1, 719, 396	1, 096, 494 142, 68
France	4, 949, 912 4, 431, 998 6, 424, 622	15, 859, 150 2, 818, 98 2, 884, 94
Holland Portugal	50, 454 29, 805	296, 93 11, 59
Paraguay	875, 047 17, 800, 187	80, 27 11, 784, 25 2, 244, 37
Uruguay	257, 961 41, 801	3, 969, 00 14, 061, 60
Total	49, 558, 375	81, 632, 82

The foregoing figures show an increase in the export for 1898 over that of 1897, of some \$17,000,000 gold. This is accounted for, in part, by the large increase in the tonnage of wheat in 1898 over that of 1897, demonstrating that the commission appointed by the Government for the purpose of exterminating the locusts was successful in a large degree in its efforts and that the money appropriated for that purpose (some \$2,000,000) was well invested. It is the firm intention to continue the work of the commission until the dreaded locusts are exterminated.

The large increase in the value of grain exports also confirms the above, and with the locusts exterminated and the return to agricultural pursuits of those who during the last six months have been called to perform military duty in the field, the volume of grain exports may reasonably be expected to show still further and larger increase during the first six months of 1899.

Generally speaking, there is no doubt that in estimating crop results in the Argentine Republic, the weather of the particular season is much more to be considered than any differences of soil or of agriculture. Improved systems of plowing and sowing will do much to guard against total failure of crops, and it is likely that the scarcity of labor at harvest, will be every year lessened by an increased influx of Italian laborers from Brazil, after the coffee crop has been gathered.

## Value of grain exported.

First six months of year—	Gold.
1897	\$13,600,000
1898	
	20, 202, 020

## Grain exported first six months, 1897 and 1898.

Article.	1897.	1898.
Wheat. Maize Linseed	286,000	Tons. 607, 354 152, 403 150, 938

The following are the principal exports for the first six months of the years 1897 and 1898:

		897.	1898.	
Article.	Tons.	Value.	Tons.	Value.
Hides Flour Wool Live sheep Live steers Sheepskins	144, 000	\$7, 300, 000 1, 602, 127 2, 600, 000 902, 906 2, 724, 420 1, 588, 500	26, 782 13, 584 146, 190 851, 059 286, 860 15, 173	\$5, 928, 953 604, 752 2, 840, 639 1, 053, 647 4, 489, 120 1, 978, 948

The cereal exports for 1898, up to October 24, are:

	Tons.
Wheat	671, 000
Maize	
Linseed	

Calculating the flour exports as wheat, the latter would amount to about 700,000 tons, as against 100,000 tons last year, a difference of nearly \$20,000,000.

#### UNITED STATES TRADE.

Comparing official figures for the two half years, in the first half of 1897 the imports were \$4,985,746, and in the first half of 1898, \$4,431,998. In the first half of 1897, exports were \$5,227,765; in 1898, \$2,818,987.

United States manufacturers have not yet begun to realize the value of this country as a market for their goods, or to heed the suggestions made by my predecessor as to the methods to be followed in securing the trade.

In my judgment, United States manufacturers, by establishing branch houses here carrying sufficient stock and prepared to give reasonable credit, could eventually secure a large part of the trade which is now held by other countries, it being a well-known fact that they can compete with any others so far as workmanship, style, finish, durability, and prices are concerned.

The excellence of our labor-saving machines and apparatus of all kinds, their attractive finish, durability, etc., have made some impression, but still more may be made if the suggestions in this and former reports were heeded. Buying from samples has in many cases in the past proved unsatisfactory to the purchaser, as also has the custom of paying for goods before receiving. The banking facilities are deficient, but should and no doubt will be improved by the establishment of American banks here in the near future.

American manufacturers are now manifesting a willingness to manufacture certain patterns and quantities of goods to meet local peculiarities and customs, and when this is done universally, trade with this country will increase rapidly. As long, however, as the agents sent here to represent them speak English only they will not succeed. No one can do satisfactory business in this country who does not speak Spanish, English, and French. The European merchants have long since known this, and hence they do the business. This suggestion, if heeded, will materially increase our trade.

#### SHEEP AND WOOL INDUSTRIES.

The following statistics, compiled as far back as 1830, may be interesting:

_		Woo	ol.		G1	Wo	ol.
Year.	Sheep.	Aggregate.	Per sheep.	Year.	Sheep.	Aggregate.	Per sheep.
1830 1840 1850 1860 1870 1880	2, 500, 000 5, 000, 000 7, 000, 000 14, 000, 000 41, 000, 000 61, 000, 000 78, 000, 000	Pounds. 6, 000, 000 13, 000, 000 21, 000, 000 45, 000, 000 187, 000, 000 215, 000, 000 310, 000, 000	Pounds. 2.3 2.6 3.2 8.3 3.5 4	1892 1893 1894 1896 1896	81, 120, 000 83, 800, 000 85, 300, 000 91, 700, 000 97, 500, 000 105, 000, 000	Pounds. 358, 500, 000 369, 600, 000 376, 580, 000 383, 500, 000 429, 000, 000 472, 500, 000	P unds. 4.08 4.14 4.25 4.82 4.40 4.50

This shows that while the number of sheep has increased elevenfold in the last forty years, the wool clip has grown fifteenfold, three sheep now yielding more than four did in the year 1850, on account of improvement in the breeds. Argentine wool has a ready market in Europe, chiefly in France, Belgium, Germany, and United States. The manufacturers of these countries send buyers to Buenos Ayres. The merino

wools of Argentina can successfully compete in fineness, staple, and elasticity with those of any part of the world. In the annual output of the country can scarcely rival Australia, but this will be merely a matter of time. So far, a certain amount of carelessness has marred the product, so that the proportion of rubbish is still too great. Breeders in general will no doubt learn to adopt the methods of Australia. In the introduction of sires, some very fine samples of the Merino have come from the United States. At an auction some two years ago, one Californian Merino was sold for over \$2,000 in gold. Those who take care of the Merino breeds have established a reputation for fine wool.

There is a splendid cross between Lincoln and Merino to be found at present in this country. This provides such an excellent fleece that at the last Paris exhibition, Argentina took no less than 102 prizes, of which 23 were gold medals, exceeding by far any other country of the world. The medium-sized carcass of this cross is also very acceptable

in Europe.

Judicious crossing and knowledge of each separate property are gradually producing excellent results. For instance, the Romney Marsh, quite equal in size to the Lincoln and farchardier and less liable to scab, is bound to take great prominence among importers of sires as soon as the present craze for Lincolns becomes a bit modified; an event which common sense should dictate. The Romney Marsh gives a fleece almost if not quite as good as that of the Lincoln, crosses quite as well with the Merino as does the latter, with the advantage that the progeny is not so delicate, and the meat of the "capones" is even better for export. In Entre Rios, a most useful cross between the Romneys and the blackface has been arrived at, with a very fair fleece and excellent carcass. The lest of these, in point of wool, is the Shropshire Down. It has naturally a longer and better quality of wool than the Oxfords or Hampshires; and although rather inferior in size of carcass to these two latter, wethers of this cross obtain a high price for export, either alive or frozen. The same remark may be made of the original South Down, although since this is the smallest of all the Downs, and since exporters buy almost solely by weight, the South Down cross may be considered somewhat of a disadvantage. Oxfords are greatly in demand by exporters of live stock, owing to their size and the consequent price they fetch in the British Isles. The same is even more true of the Hampshire Down. The only defects this latter has are that he has the closest and shortest stapled wool of them all, and also that for crossing purposes he is dangerously large in the bone, and unless ewes are carefully selected, many deaths may occur in lambing. Nevertheless, he possesses one great advantage for the breeder, and that is the marvelous rapidity with which the lambs develop, a year-old Hampshire wether being equal or superior in size to an 18-months Lincoln. Another very useful sheep, producing a very fine cross with the Merinos, is the Leicester, the result being a fine fleece and a good carcass. Now that the export trade is assuming such large proportions, the breeder should bear in mind that nowadays it is not wool alone that brings profits, and this remark applies particularly to those situated within fairly easy reach of a railroad station.

The sheep census of the Republic was taken in the year 1893, and the following table may be interesting, as comparing the producing capabilities of each province:

State or province.	Pastoral area.	Number of sheep.	Average number per square mile.
•	Sq. miles.		
Buenos Ayres		65, 363, 000	592
Intre Rios		4, 900, 000	163
lorrientee	22, 000	610,000	28
Santa Fe (north)		2, 400, 000	104
ianta Fe (south)		520,000	19
lordoba	45,000	1, 886, 000	31
lan Luis	20,000	240,000	12
Santiago del Estero	25,000	780,000	81
Pampa Central	65,000	6, 000, 000	92
salta	36,000	160,000	) 5
Rio Negro	85,000	2, 520, 000	30
Nenquen	45,000	115,000	) s
Chabut	240	17,000	72
santa Cruz	48,000	26,500	1
Fallegos	10, 350	116,000	11
Total	591, 875	85, 153, 500	1, 194

The enormous preponderance of proportion in Buenos Ayres is chiefly due to the fact that this province has been worked much longer than the others. There are certain districts to the north of this province where conditions are now so propitious that from 20,000 to 25,000 sheep per square league can be raised and nurtured. The districts of Pergamino, San Pedro, Arrecifes, Carmen de Areco, San Antonio de Areco, and Mercedes are the principal ones; but since there is now a desire for lands in the south and west, represented by the last six names in the table, it is only natural to suppose that in course of time, they may rival the famous Buenos Ayres province in production.

Here is a return averaged on three years' working of the woolproducing properties of the various classes of sheep, on one of the first estancias of this province:

•	Pounds per head.
Negretti stud ewes	10.48
Rambouillet ewes	8. 70
Rambouillet general flocks	6.94
Leicester ewes	7.81
Leicester general flocks	6. 29
Lincoln ewes	
First-class Leicester and Rambouillet	
General return from 35,000 head	

It will be observed from this table that the little Negretti, although half the weight of the Lincoln, has surpassed the latter in weight of wool. The same comparison may be made between Rambouillet and Leicester. But this may, to some extent, be accounted for by the fact that Merino wool, owing to its greasy nature, must exceed in weight that of the longer class. All the classes have given a good result, and, comparing this table with the former one, I am bound to note the improvement that can be made by care and perseverance.

As a concluding remark it may be stated that, counting the consumption at 8½ per cent and the annual increase at something like 16 per cent, and presuming that the proportion will remain the same, the number of Argentine sheep, soon after the end of the present century, should be about 150,000,000, with every prospect of a still greater improvement in classes in general.

#### THE FROZEN-MEAT TRADE OF BUENOS AYRES.

The first company started in 1882 with British capital, the chairman being then, as now, the foremost British financier of the River Plate, George Wilkinson Drabble. It was styled the "River Plate Fresh Meat Company, Limited." Its works are still situated at Campana, where they first started. This company started freezing under the Haslam system, a most expensive one as regards consumption of coal. Subsequent inventions have considerably economized freezing cost, and

the company, which lost heavily at first, is now doing well.

The second concern started and set going with private capital was that of S. G. Sansinena & Co., which converted the greatest portion of its grease and tallow rendering establishment into a freezing one. The managers also lost some money at first, owing to their Hall machines not doing as much work as was expected. But with the energy that distinguishes the Basque people, they increased their capital, laid down more machines, extended their premises, and increased their operations to such an extent that it is now estimated that the "Compauia Sansinena de Carnes Congeladas" is the most important, as regards frozen mutton, in the whole world. Later on the Hall system, like the Haslam, proving too expensive, the Lavergne system was adopted. is a combination of forced dry air, aided by pipes containing ammonia and brine, the result of the substitution of machinery being a reduction of coal consumption from 15 tons to 3½ tons daily. In 1886, a third concern was started at San Nicolas, on the River Parana, about 25 miles below Rosario, and a fourth was started in the same year at Lima Station, close to Zarate, on the Rosario line.

In 1885, an industry had started under the auspices of the Argentine Rural Society, the shareholders being chiefly cattle farmers desirous of finding an outlet for their production. Two shipments were made, resulting in heavy loss, the carcasses being those of animals from five to six years old and unsuited to British taste. Besides, the freezing was effected on board ship, thoroughly proving the error of freezing anywhere but on shore. This concern liquidated. Another firm is now

seeking capital to operate in the province of Buenos Ayres.

The total capital of the four concerns now working is estimated at nearly \$6,000,000 gold. All are working as companies, three with English and one with native capital. The total number of machines now in use, principally of the Lavergne-Stern system, may be stated at over 60, of which the Sansinena has four main engines and a total of 35 of various classes, the combined horsepower of all four concerns being nearly 1,700.

The workmen employed number some 1,300 or over, being classified as foremen, earning \$4 to \$6 paper currency daily; slaughtermen, skinners, skin-dressers, and general workmen receiving on an average

\$3 paper currency per day.

The supply of sheep is mostly from the Province of Buenos Ayres, although a certain number comes from still farther south, and some,

also, from Entre Rios.

As to the most desired class of sheep, the first to be mentioned is the pure Hampshire Down; but all the Down classes are in demand. Lincolns are also highly esteemed. There is a mestizo, a cross between Merino and Shropshire black face, which is likewise popular in both British and French markets. Steers are obtained from the Provinces of Buenos Ayres, Cordoba, Entre Rios, and San Juan, but the trade is limited, owing to the difficulty of obtaining the necessary class of animal in sufficient numbers.

The average weight of the "wether en pie" is about 50 kilos (110 pounds), although there have been notable exceptions; for instance, one 18-month black-faced wether produced a trimmed carcass of over 120 pounds. The steer, alive, in good condition, may be reckoned at something over 700 kilos (1,543 pounds), with a carcass of 350 kilos (771 pounds). In both cases, there is about 50 per cent difference.

The cost of a wether may be reckoned at from \$6 to \$8, paper cur-

rency; that of a steer of good weight, at about \$60.

After extraction of heart, kidueys, tongue, etc., the bare carcass is subjected to the freezing process, from 15° to 20° (F.) below zero being applied. When quite hard, the carcass is sewn up in thin cotton cloth and transferred to place of deposit and thence aboard ship. At Campana and San Nicolas, the steamers receive alongside wharf; in the port of Buenos Ayres two small steamers transship, and at Zarate, trolleys or refrigerated cars are used. The system of chilling beeves, instead of freezing, is being tried. It requires far less work, but more care, and great difficulty with this system has been encountered on crossing the equator. It will take some time and experience before the Argentine Republic can successfully compete with the United States in the chilling process.

Rates of freight vary. Two of the companies ship in steamers belonging to their agents in Liverpool; the others charter from two or three lines. In the former case, 2 shillings (48 cents) per pound is paid, in the latter about 4 shillings (97 cents). Great Britain does by far the greatest amount of the carrying trade; but one French line carries a large quantity of the Sansinena meat to France and England. Stowage is an important matter, careful stevedores fitting the carcasses into one another so as to economize one-third of the space. On arrival at port of destination, if the market is slack, the meat is dispatched to the different towns in the British Isles or France, where there are freezing

deposits, and it is retailed, thus avoiding loss.

The residue is utilized as follows: Entrails are sold here to be boiled down for tallow and grease. The long gut is salted by German and Italian firms for sausage skins and strings of instruments, and sold under the name of catgut. Shinbones form knife handles, buttons, combs, and the like. Kidneys and hearts are frozen, tongues salted or frozen, sheepskins dried and baled for export, horns and piths exported, and hoofs boiled down for glue or grease.

The present rate of slaughter is set down at about 2,500,000 sheep

vearly, having greatly increased of late.

The following is a table of the exportation up to January 1, 1898:

	Frozen	wethers.	Frozen steers.	
Year.	Weight.	Value, in gold.	Weight.	Value, in gold.
1890	Rilos. 20, 500, 000 23, 500, 000 25, 500, 000 25, 040, 000 36, 500, 000 42, 000, 000 45, 000, 000 47, 000, 000	\$1, 650, 000 1, 965, 000 2, 004, 000 2, 003, 000 1, 650, 000 1, 804, 000 2, 000, 000	Kiloz. 663, 000 74, 000 284, 000 2, 800, 000 27, 000 159, 000 300, 000 373, 750	\$53, 000 6, 000 23, 000 222, 500 12, 500 63, 000 120, 000 121, 890

The profits of the industry have naturally varied greatly, according to the price paid for the meat in England, one company earning a

dividend of 13 per cent in 1895, and in 1897, nothing. It is generally supposed that 13 per cent is the highest dividend ever gained in this business, but it is known in certain circles that the Barracas establishment when a private firm gained between 25 and 28 per cent. Last year was almost without profit for all, the very best of the concerns having to content itself with a meager 5 per cent.

There is now some talk of a new company which will construct a factory in South Barracas, near the Boca. This would tend to show that the industry in general is progressing and remunerative.

The following table gives details as to the firms now working:

Locality.	forma- tion.	Ground and buildings.	Machinery.	Total.	Staff.
Campana. Barracas al Sud	1882 1884 1886 1886	\$1,500,000 1,450,000 540,000 1,075,000	\$304, 280 425, 000 420, 000 220, 000	\$1,604,280 1,875,100 1,260,000 1,195,000	846 391 110 878
Total		4, 565, 900	1, 369, 280	5, 984, 380	1, 225

During the year 1896, a marked increase took place both at Campana and Barracas, the former exporting 11,000,000 kilos (24,250,600 pounds) of frozen meat; 250,000 kilos (551,150 pounds) of preserved meat; 1,125,000 kilos (2,480,175 pounds) of tallow and grease, and 3,012,000 kilos (6,640,255 pounds) of other products, with a total value of \$1,035,000 gold; the latter (Barracas) exported 19,497,076 kilos (42,983,254 pounds) of frozen meat, produced 4,293,896 kilos (9,466,323 pounds) of tallow and grease, and 2,130,552 kilos (5,303,210 pounds) of other products, of a total value of \$2,709,000 gold.

Other articles of consumption are exported, such as ducks, turkeys, game, and fish, which go both to England and France, principally the

latter country, and find a ready sale.

There exists some difficulty in obtaining reliable information regarding the actual working results of three of the companies, as their reports and balance sheets are published in England, but considering that the industry, started fifteen years ago, is on the increase, it is natural to

suppose that it must have proved remunerative.

It is reported that the present rate of slaughter, owing to improved prices in Europe and economy of expense, has increased to the annual number of 600,000 at Zarate, 800,000 at Campana, and nearly 1,000,000 at Barracas. Although the four companies of the River Plate have not yet equaled in quantity the exportation of Australia and New Zealand, with twelve or fourteen companies in each, it is to be doubted whether either of these latter colonies can show individual concerns of such magnitude as exist on the River Plate.

In view of the pastoral area of the River Plate, the quality of grasses, cheapness of land, influx of capital, improvement of breeds, steady immigration, and extension of railways, there is every reason to believe that Argentina is destined to attain preeminence as a meat producer

for European markets.

## LUMBER.

The import of lumber for the first six months of 1897 was 135,137 cubic meters, and for the first six months of 1898, 155,953. The new duty of 10 per cent on valuation added to spruce and white and pitch

pine lumber is \$3.50 a thousand, making the duty \$9.35 a thousand. The tariff on black walnut is increased to \$56 paper a thousand, which is practically prohibitive. White ash and white oak are increased to \$10 a thousand. This duty must cause a serious reduction in the amount of lumber imported next year, and a lumber famine is among the possibilities.

It is hard to explain the motives prompting this large increase in the tariff on lumber, for large quantities are necessary to continue the

improvements projected and in progress.

This tariff, virtually a prohibitive one, will decrease rather than increase the revenue, and paralyze the importation of lumber.

#### WOOD.

The export of Quebracho wood in 1897 amounted to 114,000 tons, and for the first six months of 1898, to 81,186 tons. This trade is increasing, and a good quantity of this wood finds its way to the United States.

#### COTTON TEXTILES.

There are in the Argentine Republic four different woolen factories, making also the coarser cotton textiles. They receive the cotton prepared for the weaver's loom from the United States and England. The goods are usually woven sixty threads to the inch, 65 centimeters (25.6 inches) in width, 144 to 146 grams (5 to 5.1 ounces) per meter (1.09 yards), and sold from 48 to 50 cents paper (18 to 19 cents, gold), per meter.

A small quantity of coarser cotton textiles is imported from Italy. Dry goods and clothing are imported largely from England and

France.

## CENTRAL PRODUCE MARKET.

This market, situated in this city, is said to be the largest in the world. It is certainly the largest under one roof without partitions. It is of an irregular form, measuring at its greatest width 378 by 180 meters. It is built mostly of iron, except the flooring and stairs. The brick walls are not meant to support anything, and merely form, as it were, the shell. The building really tests on some 2,500 iron columns. The roof is of galvanized iron and of ribbed glass, which style is known as "the weaver's roof." This is so built that, while allowing plenty of light, the sun does not penetrate. The building is traversed by eight roads, four of these being for railway trucks and the others for loading and discharging carts. There are three floors, measuring a total of 119,000 square meters, with a total capacity of 160,000 tons. There are 6,800 meters of railway sidings, which give standing room sufficient for 750 trucks. The quay is 500 meters long, and is fitted with hydraulic cranes, etc. The company possesses two six-wheeled coupled engines. These are used for ordinary shunting in the yard, but all other work, such as placing trucks in berth ready to be discharged, hoisting bales of wool or bags of grain, etc., is done by hydraulic power. There are four 40-horsepower engines and accumulators, seventy-four 3 ton cranes, forty-four capstans, and forty-six hydrants, the working pressure being 750 pounds to the square inch.

For protection against fire, there is a powerful pump connected with the Riachuelo River by means of a 12-inch pipe, which throws 3 tons of water per minute. Specially chosen men are drilled once a week in

the use of the various fire apparatus, while for night service, there is a staff of twenty-four men, composed of an inspector, an engineer, two firemen, and twenty watchmen. The total area occupied by the build-

ing and railway sidings is 111,775 square meters.

It is now twelve years since the company was formed to carry on the business of a central produce market, but the first train of goods did not enter its doors till May 20, 1890. The largest number of bags of cereals in stock at one time was 856,000, or about 69,000 tons. In regard to wool, the greatest amount on hand has been 16,000 tons, average value \$11,500,000 paper currency. Since the 1st of October of last year to this date, the wool received here has amounted to 124,000 tons. The number of employees during the aforementioned period averages 514 men daily, all told.

#### NAVIGATION.

There are in this consular district eleven ports of entry, which I describe as follows:

(1) Buenos Ayres.—Ships of over 21 feet draft have often to wait many days for sufficient water to enter or leave. There are projects before the Government to improve these channels, which some day may be carried out. Dredging alone can not effect it. The deepening of the channel is much to be desired, so that full advantage of the fine docks may be obtained by the shipowners, the docks having a depth of 23 feet; the channels should have a similar depth. These docks are said to be the finest in the world.

The following table will show the arrivals and departures of steamers and sailing vessels for the year 1897 at this port:

Maria.	Arrivals.		Departures.	
Class.		Tons.	No.	Tons.
Steamers	6, 827 3, 586	5, 5 <b>22</b> , 978 541, 091	7, 283 7, 259	596, 313 5, 945, 255

The following table will show the arrivals and departures of steamers and sailing vessels for the first six months of 1898 at this port:

Class.	Arrivals.		Departures.	
Class.		Tons.	No.	Tons.
Steamers	3, <b>297</b> 1, 661	2, 845, 674 341, 519	3, 682 1, 582	3, 426, 336 3, 240, 008

(2) La Plata.—This is the port of the capital of the province of Buenos Ayres. It is in a direct line 25 miles east-southeast of Buenos Ayres, but following the channels the distance is over 30 miles. The depth of water at the entrance of the moles is about 23 feet, and in the Grand Dock, 22 feet at ordinary low river. The distance from the mole head to the entrance of the dock is 3½ miles in a direct line. The dock is without gates, and a steamer can proceed direct to her berth or to the head of the dock, where it is much wider, for the purpose of turning. Various English coal companies have their depots here.

The mail steamers now make their run here instead of to Buenos Ayres, owing to having the advantage in La Plata of 3 feet more water. Passengers embark and disembark with ease, the railway station being

on the dock side, but as the majority are bound to Buenos Ayres, much inconvenience would be avoided if the ships landed their passengers here.

The following are the trade returns of the port:

In 1897, there entered and cleared 259 steamers with 556,310 tons,

and 822 sailing vessels with 63,843 tons.

In 1896, there were 523 steamers of 965,687 tons, and 1,049 sailing vessels with 148,788 tons. Difference in favor of 1896, 264 steamers of 409,307 tons, and 227 sailers of 84,945 tons. This shows the shrinkage of trade, due to bad harvests, to have amounted to over 40 per cent in tonnage.

(3) San Nicolas.—This is a small port, at which ocean-going vessels of 20 feet draft can load or discharge. Two important industries are

a large distillery and a freezing establishment.

(4) Bahia Blanca.—This port is 515 miles from Buenos Ayres; it has a bar harbor of 10 feet at low water, at spring tides, and a rise and fall of 12 feet. It is rapidly rising in importance, and shipping facilities are short of the requirements, as two ocean steamers only can be accommodated at its wharf. Large shipments of wool and grain are made here.

(5) Mar del Plata.—This port has its custom-house. A large quantity of fish is sent to Buenos Ayres daily, and the potatoes grown in the

district are of the best to be had in this country.

(6) Port of Campana.—This port is 70 miles from Buenos Ayres. The Rosario and Buenos Ayres Railway Company has its principal shops here, and an excellent wharf for loading and discharging. The River Plate Frozen Meat Company has a large establishment for freezing, and a wharf on which it receives stores direct from England and ships its productions. Here is also a large distillery of alcohol, which has its own wharf, and is connected with the railway. The principal exports are beef and mutton, tongues, sheep, skins, and tallow. Grain is also shipped. Coal, iron, rails, and railway stores are imported.

(7) Zarate.—At this port is the only paper manufactory in the Republic; the coarser kinds of paper are made. The water is deep, but the wharf for merchant vessels is very small and inconvenient. There

is a custom-house.

(8) Las Palmas.—At this port is a large meat freezing company, which, in 1897, exported over 650,000 carcasses. The custom-house business of this port is transacted at Zarate.

(9) Baradero.—This port has a custom-house, and its exports are

principally cereals.

(10) San Pedro.—This is a beautiful little town, and large quantities of grain are shipped from here, but ocean-going vessels have to anchor outside.

(11) Villa Constitucion.—New wharfs 800 meters in length have lately been completed; there is an elevator for the clearing and classifying of grain, with an endless belt to convey the grain direct from the elevator to the ship. Depth of water at the wharves at ordinary low river is 18 feet. Principal shipments are cereals.

#### PORT DUES.

Steamers or sailing vessels pay 15 cents gold per ton, register, for tonnage; 10 cents gold per day for ton, wharfage; 7 cents gold per ton, light dues, and the sanitary charges are 1 cent gold per ton, and 3 cents if the steamer or vessel come from an unhealthy port; the half is charged if in ballast.

Pilotage is compulsory, or if the vessel arrives without pilot, one-half pilotage has to be paid to the custom-house. The rates of pilotage are from \$75 to \$100 gold, from Buenos Ayres roads to the docks.

The slingage and port laborage charges have been changed as follows:

	Storage.	Slingage.
Per 100 kilos powder and explosives	Oents. 15 5 3 25	Cents. 30 10 6 50

All these charges are per month, and no direct dispatch is permitted.

#### TARIFF.

There has been an increase in the tariff on imports into the Argentine Republic, amounting, in most cases, to an addition of 10 per cent on the custom-house valuation of the merchandise.

On exports, 4 per cent is levied on custom-house valuation of the following: Tallow, feathers, wool, hides, horse hair, bones, horns, and mare's oil. All other exports are free of duty, having only to pay a stamp tax of 1 per cent on weight declared.

## ELECTRICITY AND MACHINERY.

There is an opening here for electric appliances of all kinds and for bicycles, to which machine the natives have taken a great liking. They prefer the American machine. Hundreds of devices of United States origin, not known in this market, would undoubtedly be well received.

There are five electrical companies in this city, with a capital of

\$6,000,000, and electric tramways are being built.

#### RAILWAYS.

Buenos Ayres and Rosario Railway.—The present title of the Buenos Ayres and Rosario Railway is somewhat of a misnomer, for it has long outgrown its name, and is now the direct line from Buenos Ayres to the north of the Republic. The line has a total length of 950 miles, and employs 4,300 men; owns 109 engines, 173 passenger carriages, and has a carrying capacity of 46,263 tons and 4,409 wagons. There are 110 stations on this line, and 2,579,306 passengers and 892,030 tons of goods were carried during the year 1897.

Buenos Ayres and Pacific Railway.—This line runs in an east to west direction, the total length being 426 miles. Sleeping and restaurant coaches run from Buenos Ayres to Mendoza. The road employs 600

men.

Buenos Ayres and Transandine Railway Company, Limited.—This line is not yet finished, but when completed will be very popular, as it is the only road from this city to the Pacific, and it would be difficult to overestimate its political importance, as by providing rapid intercommunication, it tends to produce a better understanding between the countries concerned.

Buenos Ayres and Ensenada Port Railway Company.—The total length of this road is 211 kilometers. The service is excellent. This line has the reputation of running the fastest trains in the Republic. There are

Digitized by GOOGIC

several very large saladeros, or cattle-killing establishments. Their products are shipped in Spanish vessels, which in turn bring salt for local use.

There are also in my district four other railway companies, as follows: Central Argentine Railway Company.—This line has a total length of 834 miles.

Buenos Ayres Great Southern Railway Company.—Total length of line, 1,479 miles.

Bahia Blanca and South Western Railway Company.—Total length of line, 234 miles.

Argentine Great Western Railway Company.—Total length of line, 319 miles.

The increase in the number of miles of railway open over the year 1896 is 282 miles. No new lines have been constructed, but many are projected.

## TRAMWAYS.

There are 10 companies, and the lines extend 393 kilometers; 1815 cars and 10,592 horses are used, and 4,889 persons employed. There is also the Buenos Ayres Electric Tramway Company, operating from Buenos Ayres, to Belgrano, about 10 miles from this city. This line is equipped in the best and most substantial manner, and it is to be noted in this connection that this is the first line in which all of the cars are controlled by means of electric brakes. I am glad to say that all the equipment is of United States manufacture. The power is supplied by a 750-horsepower triple-expansion engine.

#### CITIZENSHIP.

Foreigners can become naturalized citizens after two years' residence in the Republic, and are exempt from military service for ten years. All public offices are open to them except those of President and Vice-President.

## AREA AND POPULATION.

The area of the Republic is the same as last year. The population of Buenos Ayres, on January 1, 1898, amounted to 730,484. The increase of population is due to immigration and the decrease in mortality, owing to improvements in sanitary regulations.

#### WAGES AND PRICES.

The usual wages paid in the port of Buenos Ayres for loading and unloading ships are as follows (paper) per day:

Wharf hands	\$4,00
Second foremen	5.00
First foremen	

After 6 o'clock p. m. the rate is doubled. The foremen are paid from the beginning to the end of the work.

The value of most commodities remains stationary, the rise or fall in gold, strange as it may seem, not affecting prices. Goods are sold, retail and wholesale, for paper money.

## POST AND TELEGRAPH.

The postal circulation for 1897 was 191,895,742, an excess over that of 1896 of 30,062,952.

The length of telegraph wire throughout the Republic on July 1, 1898, was 18,531 kilometers; 38 new offices were opened and 2 offices

closed during 1897.

The receipts at the post-office amounted to \$3,032,970 in 1897. receipts of the postal telegraph amounted to \$1,133,598 during 1897, an increase of \$214,971, or 6 per cent on the postal receipts and 31 per cent on those of the telegraph over the preceding year.

For postal rates, see annual report of last year (Commercial Relations, 1896-97, Vol. I, p. 780).

The telegraphic messages which are sent by national lines are subject

to the following tariff:

A fixed duty of 30 cents for every message which does not exceed 100 words and 3 cents for every text word, to which will be added 1 cent for the construction of new telegraphic lines.

For telegrams with acknowledgment of receipt, the fixed duty will be 70 cents. Urgent telegrams, three times the tariff for each text word.

Telegrams dictated in languages agreed upon, or letters, or secret ciphers, and which are admissible according to law of 1875, will pay a fixed duty of 20 cents for each word, or lot of five words or ciphers in the text. In legible language, as well as in secret language, double will be counted for every underlined word. When a cipher or number is followed by a letter, it will be considered as separate.

## RATES OF FREIGHT.

The rates of freight for the United States are as follows: Dry hides,  $1\frac{1}{2}$  cents per kilo (2.2046 pounds); bones, \$3.50 per ton.

For Europe: Live animals, from \$20 to \$25 per head; frozen meat, about one-half cent per kilo, according to contract; maize, \$4 per ton.

#### LICENSES.

Commercial travelers have to pay a National Government license of \$100 paper 1 a year, counting from January to December, or \$50 paper more than last year. Commercial houses pay licenses according to classification.

### REVENUE.

The gold revenue for the year 1897 was \$31,226,100, and for the first six months of 1898 was \$16,673,354.

The internal revenue for the year 1897 was \$19,650,000, and for the

first six months of 1898 was \$8,879,655.

The expenditure of the Argentine Republic in 1897 was \$156,019,899 paper; revenue, \$162,311,500 paper.

#### PATENT LAWS.

The patent laws of the Argentine Republic at present in force were

promulgated October 11, 1864.

Subjects for patents.—New discoveries and inventions of industrial application, embracing new products, new methods, and new application of any generally known means of reaching certain results or manufacturing new products.

Term.—Patents are granted for five, ten, or fifteen years, according to the merit of the invention, or as the applicant may desire. The ratifi-

¹ The value of the paper currency is stated in a subsequent report at \$2.50 paper,

cation of foreign patents is limited to ten years, but can in no case exceed the term of the original foreign patent, with which it concur-

rently lapses.

When the term of application for an ordinary patent exceeds ten years and it is considered equitable by the commissioner, the papers are forwarded to the minister of the interior, who will either accord or limit the term. From his decision there is no appeal.

Precautional patents are granted for one year, this term being

renewable.

Government fees.—For new patents, \$82.66, \$206.66, and \$361.66 (paper currency), must be paid, according to the term granted, of five, ten, or fifteen years, respectively. In the case of additions or improvements, one quarter and a half of these respective sums must be paid, the first amount if the applicant is the grantee of the original patent and the second if it is some other person.

#### TRADE-MARKS.

The trade-mark laws of the Argentine Republic bear date of August

19, 1876.

Duration.—The term accorded for the exclusive enjoyment of the rights conferred by registration is ten years, renewable indefinitely for similar terms on payment of the prescribed duty and compliance with the usual prescriptions.

Government fees.—Registration and certificate of renewal of a trademark, \$41.33; registration and transfer of a trade-mark, \$20.67; dupli-

cate copies of certificates, \$4.13 and cost of stamps employed.

#### RATES OF EXCHANGE.

During the first half of 1898, the highest rate was in the first fortnight of January, namely, 48§d. on England, and the lowest rate during the first half of May, namely, 47,6d.

Bank rates to day are as follows: On England, 48d. at 90 days; on France, 5 francs at 90 days; on New York, \$1.06 at sight; on Antwerp,

5.06 francs at 90 days; on Hamburg, 4.10 marks at 90 days.

Bank discount rates stand  $7\frac{1}{2}$  per cent for paper and  $6\frac{1}{2}$  per cent for gold.

#### MINING INDUSTRY.

Nothing new or interesting can be said in regard to mines and mining in this country. There is as yet nothing to report for the amount of money which of late years has been invested in mining machinery. The different gold-mining companies are periodically publishing exaggerated reports of what they are doing and of the prospects of soon finding the precious metal. This is done, I suppose, either to keep up the drooping spirits of stockholders, or in order that those who are carrying heavily may unload on others, who may be induced to try their fortunes in an industry which has never yet paid anything on the capital invested. I am glad to say that but few Americans have been caught in this trap.

## SANITARY CONDITION.

The sanitary conditions at this port and in all the ports in my district, as well as in this city, are excellent. No epidemic has made its appearance, and the Government spares no money in keeping the streets clean. The water supply is abundant and free from organic matter.

#### GENERAL.

It seems necessary that some reference should be made to the constantly increasing number of letters of which this consulate is the the recipient. Every mail that reaches here from the United States brings its large quota. Not infrequently, the number received by a single mail reaches 70, and is scarcely ever less than 30. A large proportion of them ask for reports about the trade, etc., of this country. A good many desire information for the purpose of coming here with their families; others are from young men who wish to find employment here. The first prerequisite for obtaining business employment here is a knowledge of the Spanish language. It is the medium of all transactions and interchange of thought, and it is money thrown away to venture here without such knowledge. I may add that if any Americans persist in coming here in the hope of bettering their condition, they should bring enough money with them to get back home again. In nine cases out of ten, as I know by actual experience, it will only require a short sojourn here, where labor is cheap and paid in depreciated currency, to impress them with the blessings they have left behind them.

There seems to be an impression in the United States that there is a large American colony in this country, composed of families permanently residing here for the purposes of trade and commerce. This is altogether a mistake. There are a few permanent merchants in Buenos Ayres who are engaged in the export or import trade with the United States, but the greater number may be said to be here only temporarily. There are not, perhaps, 150 Americans in the whole country, and these are so scattered that they can hardly be called a colony.

D. MAYER, Consul.

BUENOS AYRES, October 29, 1898.

#### FINANCES OF THE ARGENTINE REPUBLIC.

Consul Mayer writes from Buenos Ayres December 29, 1898:

The budget committee of the chamber of deputies appears to have done its work conscientiously, in preparing the budget of national revenue and expenditure for 1899. It disregarded the budget presented by the ex-minister of finance in September last, which was based upon the conversion of gold receipts at 270 per cent, while the committee has adopted the rate of 200 per cent. It is proposed to retain the impost directed by a law of September last, of 10 per cent additional upon the value of the bulk of all imported merchandise, and of 5, 4, and 2½ per cent respectively upon the remainder, the rates varying according to the existing duties. The tax is inequitable, because it varies between 20 per cent and 100 or more per cent upon the duties previously paid, but its imposition was justified last year by the necessity of providing for the defense of the country, and its continuance is defended by the necessity of covering a deficit.

The amount of the floating debt on November 5, including treasury bills, was \$15,826,539 national money and \$22,891,763 gold, against which there was a balance in cash of \$5,040,622 national money and \$1,020,432 gold, leaving a balance to be paid of \$10,185,917 national money and \$21,873,331 gold, to which has to be added the amount due by the Government, which had not then fulfilled the formalities necessary for making it demandable. The committee properly advises that this demandable debt should be got rid of, and proposes that a loan of

\$30,000,000 gold should be obtained gradually and at short dates, applying to the interest and amortization the annual sum of \$4,000,000 gold.

The estimated expenditure is \$26,920,632 gold and \$98,946,052 national money, being (if gold be converted at 200 per cent) about \$1,300,000 national money less than the revenue. The ordinary expenditure is \$1,318,350 more than that of this year, while the service for the payment of the floating debt and of the popular loan involves an addition of \$2,120,468 gold and \$4,564,247 national money. The marine department will spend \$2,169,897 more in keeping the new ships in proper condition, and the new ministry of agriculture, the new special office for the alcohol tax, and the pensions will add to the budget \$1,6.9,683.

On the other hand, the expenses of the ministry of the interior are reduced by \$503,080, principally in the post-office and department of hygiene; the minister of education spends \$700,118 less in subventions, scholarships, and the administration of the national council, which is to pay its expenses out of its funds; the ministry of war saves \$338,524 national money and \$25,000 gold, although four more corps have been created, by reducing the administrative expenses and the number of employees; the ministry of public works will save \$665,000 in public works passed to the extraordinary budget, and \$549,760 in salaries and expenses. The public debt absorbs \$21,308,331 gold and \$10,831,218 national money; salaries are about \$44,000,000 national money; general expenses, \$36,750,000 national money, and public works, \$18,050,140 national money. The committee advocates further reductions, as follows: Two million dollars in the naval department, by disarming the ships of the third and fourth classes and half disarming those of the second class; \$200,000 in the ministry of war, by reducing the army by 2,000 men; \$2,300,000 gold on Belgrano military port and the Martin Garcia canalization, by giving in payment for the works the bonds authorized by law. It is also suggested that the general expenses of the administration might be reduced by \$3,500,000 more. It is, however, quite safe to assume that congress will not agree to any reduction of expenditure which involves the dismissal of employees, the reduction of the army, the disarming of the fleet, or the suppression of subventions or of public works. Indeed, it will be surprising if the estimates are not largely increased by special laws passed during next session. The revenue is estimated at \$41,870,867 gold and \$69,822,000 national money, being \$7,111,721 gold and \$16,904,000 national money more than that of this year. The committee advocates the suppression of the additional duties on imports and of all the duties on exports, showing that this might be done by obtaining a loan for the execution of the necessary public works, estimated at \$30,000,000 gold, and by obtaining \$500,000 gold from the increase of duties on certain articles which are not prime necessaries of life.

#### CORDOBA.

There are no statistics published as to the commerce and industry of this State. I receive constantly, and have distributed, quantities of circulars from business houses, but it is hopeless to expect results from them. Nine-tenths of the wholesale houses purchase in Buenos Ayres, because the larger merchants there can control prices. Long credits are the rule. The foreign houses here (Spanish, Italian, French, and

German, in order of importance) have the business, simply because they grant credits, and are supported by parent establishments in Buenos Ayres or abroad; there is no reason why a United States house should not do equally well under the same rule. On account of the results of the war, United States stock is rising in the eyes of this people, and the opportunities for trade would seem to be good, especially in Buenos Ayres and Rosario, whence it could be rapidly extended, if conducted on principles of fair profits and good qualities. This is a favorable time, also, for the Chilean boundary question has been settled, and this country will soon develop.

JOHN M. THOME, Vice-Consul.

CORDOBA, October 2, 1898.

#### ROSARIO.1

This district comprises the provinces of Santa Fe, Entre Rios, Corrientes, and the eastern (pampas) portion of Cordoba. The port of Rosario is the one through which passes all the exports and almost all the imports for all of the Argentine Republic to the north and west, though a portion of this domain is, theoretically, in the vice-consular district of Cordoba.

Nature has done much for this port, and man but little. The volume and momentum of the Parana River are such that, with little or no help from dredging, there is the whole year round good anchorage within 20 feet of the banks for vessels drawing 22 feet of water. On these banks, bluffs of tenacious clay, 60 to 70 feet above the river, are built the barraccas or warehouses, in which the hides, wool, hair, grain, etc., are baled or bagged, and from which, through smooth covered chutes, or often in suspended troughs, the bags, bales, or cases of export material are rapidly slid directly into the holds of the vessels, which convey them to their foreign destination. In many places, the railways have switches running alongside platforms on these high banks, from which the bagged grain is shot direct from the estancias with incredible rapidity into the hulls of the waiting steamers, over the slender-looking, swaying troughs. Of the volume of this traffic, I must very reluctantly report, I am unable to give any statistical data. The officials of the port either do not keep in shape for separate compilation a record of their export trade (which I think is probable), or have an indisposition to furnish it for our official information. I have, after the most strenuous and persistent effort, failed utterly to obtain any data whatever to assist me in this report.

## PORT ACCOMMODATIONS.

There have been no recent changes in the customs rules, port regulations, quarantine regulations, or wharfage dues. The little that can be accomplished by two steam dredges that are constantly employed in loosening the rapidly accumulating sand and silt of the river bed, to allow it to be carried on by the current, is about all that is being done for the improvement of that port, many permanent improvements being projected but not accomplished, which is probably due in part to the financial condition of the country, and also to the natural disposition of the Hispano-Latin race to not do anything to-day that can be put off till to-morrow.

#### TARIFF CHANGES.

Of changes in tariff rates on imports, there have been recently made

the following:

Goods formerly paying 2½ per cent ad valorem now pay 5 per cent; goods formerly paying 4 per cent ad valorem now pay 8 per cent; goods formerly paying 5 per cent ad valorem now pay 10 per cent; goods formerly paying 10 per cent ad valorem now pay 20 per cent; goods formerly paying 25 per cent ad valorem now pay 35 per cent; goods formerly paying 50 per cent ad valorem now pay 60 per cent; and on goods paying specific duties there is an advance of 10 per cent.

#### TAXES.

For commercial travelers there is a tax of \$50 per month of national money (about \$20 of United States gold) and this same rate is charged to any commercial house, with its head in a foreign country. Insurance agents pay \$200 per annum, and what we know as curbstone brokers the same. The owners of thrashing machines pay, for the privilege of operating them, as follows:

Fer an	
10 to 12 horsepower	\$250
6 to 8 horsepower	200
4 horsepower or less.	150

In none of the imposts or taxes do I find any discrimination whatever against the United States.

#### FREIGHT RATES.

Freight rates vary here, as everywhere, according to the demand. For instance, two months ago they were firm at 22s. (\$5.35) for Liverpool; they have since dropped to 12s. (\$2.92) and are now firmer at 15s. to 17s. (\$3.65 to \$4.14).

#### TRADE.

Of the exports to the United States for the year ending June 30, 1898, I am able, from the records of this office, to report the following:

[Values in United States gold.]

# Bones \$75, 984, 68 Calfakins 21, 517, 89 Cuttings, hide 1, 441, 15 Feathers (ostrich) 64, 64 Goatskins 638, 891, 13 Hair 165, 614, 11 Hides 1, 742, 696, 24 Kid skins 2, 272, 91 Maca skins 229, 30 Nutria skins 3, 899, 87

 Nutria skins
 3, 899. 87

 Sheepskins
 1, 575. 63

 Wool
 871, 147. 91

I have also been able to compile, from unofficial sources, a statement of the principal exports of the entire Argentine Republic for the first nine months of the current year, which is hereto appended.<sup>1</sup>

<sup>&</sup>lt;sup>1</sup> Replaced by a statement of exports for the entire year, sent by Consul Ayers under date of January 23, 1899.

Of the imports into this district, I can learn nothing with positive or even approximate exactness, as even the records of this office only show what has been landed at this port from the United States, whereas much of the supply is landed at Buenos Ayres, and from there distributed through the provinces. From personal observation and persistent inquiries, I am enabled to report that the volume of trade with our country in the matter both of exports and imports, is increasing, not probably with great rapidity, but with a healthy growth. There seems to be, on every hand, an awakening to the advantage to the consumer of the nearness of the markets of the United States, no less than of the general superiority of the products it offers for sale. It is the universal verdict of traveling representatives of American firms, in all lines, that if they had a little more time to work up their trade, or fuller samples, or could give a little better terms as to time, etc., there would be scarcely a limit to the amount of goods they could sell There is no question of the fact that our goods, machinery, implements, hardware, fancy groceries; railway, telegraph, and electric supplies, and last but not least our coal, are in the front rank of popular estimation, and with a proper business attention to the wants and requirements of this peculiar people, the United States can stand forth as a stalwart competitor with the other producing nations of the world in this rich market.

Many of our dealers and exporters make the grievous mistake of sending good articles on orders for the first few shipments, until they think the trade is secured, and then allowing the quality to become deteriorated, which results not alone in the loss of trade in that article, but also in loss of confidence as to the reliability of our goods in general. In the matter of packing, also, there is frequently too much laxness. A short time since, a large shipment of railway supplies (car material). in all 327 packages, came to a railway company here so badly cased as not to stand their own weight in being lifted out of the ship, resulting in the wreck and loss, not alone of the goods, but of the reputation for care and thoroughness of American manufacturers and shippers. Such things militate against our country, and if I could only impress upon our manufacturers the absolute necessity of practical business judgment in packing for shipment to this or any other foreign country, where they are to come in competition with the careful, painstaking methods of European houses, I think this report would not have been written in vain. As to the necessity of a closer financial relation, that business transactions may be consummated with our own banks direct and not through the medium of English banking houses, as at present; of direct lines of steamers for the regular and rapid transmission of our mails and goods, with sufficient subsidies by our Government to justify perfect regularity of service; of the establishment, at a central distributive point, of warehouses for our manufactured goods, with resident agents, who would grow to learn the people, their customs, their language, and their financial standing, and with a system of credits that would enable us to compete also in that regard with the established European houses, I need not reiterate what has been often and better said before, and what is, presumably, the chronic cry of consuls in all the Latin American ports. These matters must all be met intelligently and with determination, if we really desire, as a commercial nation, to have our rightful share in the business of these our near and wealthy neighbors.

#### MAILS.

The time of transit of mail between Rosario and New York is now about thirty days by slow freight steamer direct, or thirty-five days by trans-Atlantic lines via England. With such improved service as might advantageously be inaugurated, this time could be reduced at least 40 per cent, with corresponding advantage to American trade and interests.

#### INDUSTRIES.

The principal industries of this district may be enumerated in the order of importance, as follows: Agriculture, sheep raising, cattle breeding, railways, distilleries, breweries, tobacco factories, sugar refineries, machine shops, and wood-working establishments. All but the first three are for the benefit of the country, and their products are strictly for home consumption. By reference to the tabular statements submitted herewith, it may be seen what of the products of the farm, the fold, or the pasture reach the United States, and what are sent to other Within the scope of a report of this character countries of the earth. it would not be possible to give even an approximate idea of my impressions of the possibilities of production in agriculture and its collateral branches of sheep and cattle breeding. I am moved, nevertheless, to remark that this fertile district, extending over an area from north to south of 750 miles, and from east to west of almost 200, as level as any of our Western prairies and as free from stick or stone, tree or shrub, watered by occasional streams; with a soil composed of a layer of black vegetable loam from 6 to 36 inches deep, next this being a subsoil of a sandy-clayey character, and under this still a hard clay, ordained by nature for holding the rainfall and keeping the moisture accessible to the grain roots; with a climate ranging from 57° F. in winter to 74° in summer on an average, where stock does not require housing, where there are no inclemencies to attack the comforts of man or beast the whole year round, where roads are easily made and kept and free from grades, so that the foreign buyer at the barrancas on the river bank can easily reach a market place for the crops of all kinds of grain the farmer may elect to cultivate, offers a home for many of the patient, overworked, and underfed toilers of our great cities, who, with only health, strength, and energy, and the skill of a farmer, may even without capital make for themselves homes and a competence, and help to develop this at present almost wholly uncultivated Eden. Here grow, with no care or attention after the crop is once started, four to six crops annually of the magnificent lucerne (alfalfa). The very ease with which crops are raised seems to beget a lazy lack of thrift, and the denizens seem to lapse into an indifference, which I am convinced, would not overtake American farmers in the face of such opportunities. The larger proportion by far of the farmers of the Argentines are Italians, with little practical knowledge and little real thoroughness or method in their tilling of the soil, yet with their rude appliances and slovenly tillage these fertile fields, of whose surface not a tithe has been touched, have yielded in the past year enough wheat to furnish bread for the millions of the Republic and, as the table of exports shows, shipments of nearly 700,000 tons to help feed the balance of the world. What this one industry would arrive at under careful, intelligent fostering can only be surmised. The crop now ripening is greater in acreage by fully 20 per cent in this district, and although it has been somewhat injured in the northern portions by recent frosts, yet by reason of comparative

freedom from invasion by the locust pest, the yield is variously estimated at from 25 to 35 per cent greater than that of 1897. Regarding the locusts, their genus, habits, and treatment, I have pleasure in appending hereto an article from the Standard, of Buenos Ayres, which is an intelligent and exhaustive, though brief, treatise on this interest-

ing but destructive insect.

As to the sheep-breeding industry, which is next in importance of those of this district, the table of exports shows that the Argentines are forging to the front as amongst the most extensive and successful sheep breeders in the world. Among the sheep products exported in the last year were tallow, over 21,000,000 kilos (46,296,600 pounds); wool, over 151,000,000 kilos (332,894,600 pounds); skins, over 17,000,000 kilos (37,478,200 pounds), and nearly 2,000,000 frozen wethers as mutton. But little of all this goes to the United States. The coarse Cordoba wool, which is mostly sought by our carpet manufacturers, is being rapidly bred out of the market, and is supplanted by the longer and finer wooled Lincoln and Merino, of which there are many large and very fine flocks in the Argentines. It is not possible to dilate as fully as I should like on the unparalleled progress that has been made in sheep farming here within the last twelve or fifteen years. A writer fully conversant with the subject, after an exhaustive review of all its phases of development, says in his peroration:

In a word, this vast smiling pampa is the home-elect of the sheep, and its numerous natural advantages place it far in the van of all sheep-breeding countries.

In the breeding of cattle for export, also, wonderful progress has been made. Where the wild, sinewy, and useless animals formerly roamed these plains, now, under intelligent care, herd upon herd of cattle of fine blood browse, useful for every utilitarian purpose and a mine of wealth to their owners. While constant and valuable additions are being made to the great herds of blooded stock, much is being exported, as the following exhibit will show:

Exports of live stock, first nine months of 1898.

	European continent.	England.	Brazil.	Саре.	Total.
Steers	760	77, 404	7, 089	90	85, 343
Wethers	81, 752	451, 222	902	3, 711	537, 587

An adjunct of the cattle industry is that of dairy farming, which, as may be seen by reference to Major James's paper, hereto appended, is becoming of constantly increasing importance, for reasons succinctly stated.

In Rosario, there are six railways, extending to the north, south, and west. They are owned almost entirely by English capitalists and operated by imported employees. The shops of two of these roads are located here and are important and extensive plants. One of them, that of the Central Argentine, occupies a space of about 2 square miles, and is thoroughly equipped for car and coach building and engine repairing, and has on its pay roll some 700 men. Almost all the machines are English made, though there are a few American lathes, punches, and shears, which can easily be picked out by their light build and better finish. Regarding our machinery in general, I have been told that American engines, though lighter, will do more work, making much more rapid revolutions than the English; but require, therefore,

more care in lubrication, etc., and intelligent attendance, in the absence of which the engine fails and is condemned, not through its own fault, but from lack of proper care. American thrashing machines, being but two-thirds as heavy and doing more and better work than the English, should be preferred, but for the same reason are more liable to get out of order than the more clumsy and cumbersome English machines. For this reason, they have failed as yet to supplant the English makes, notwithstanding the fact that the American machine is sold at about two-thirds the price of the English of the same thrashing capacity. If painstaking teachers were sent with our machinery to show its capabilities, exhibit it at fairs, etc. (men who can speak to these people in their own language), the demand for American machines for agricultural and all other purposes would greatly increase.

Of the other industries of this district, I will say that they are represented by many large and well-conducted establishments. In one of the cigar and cigarette manufactories, employing about 300 hands (many of them being girls), I found a large proportion of the machinery to be of American manufacture. This is a model plant. They consume a little more than 31 tons of tobacco monthly, using Bahia and Virginia leaf mostly, immense stocks of both being carried. There are several large distilleries in the district, besides many compounding and rectifying establishments; four breweries in Rosario, and many large machine shops for ship repair and such heavy work; flouring mills, with latest improved American machinery; furniture and general woodworking establishments, in all of which some of our machinery is in successful operation, with a prospect, so well is it liked, of its use increasing when business, which has had a two years' season of unprecedented dullness, begins to improve, as it now promises. There is also a very extensive sugar-refining plant here, the crude sugar being brought down the river from the northern provinces. Some 11,000 tons of Argentine sugar have been exported thus far this year.

#### COAL.

An instance of reward for persistent effort is afforded in the fact that, after many years, American coal is beginning to be used by the large consumers of the Plate and Parana rivers, and is giving such satisfaction that the handlers are establishing large places of storage and deposit and contemplate putting on a line of steamers to transport it to the various storage places on these rivers. An English railway official told me candidly a few days ago that, after a fair trial, he was convinced it was a better coal and would make steam more rapidly and economically than the best Cardiff.

#### GENERAL.

Since the inauguration of a new political administration, which seems to inspire the business community with confidence in the renewed prosperity and prolonged tranquillity of the country, the currency (paper) has very markedly and apparently permanently appreciated, and gold, which two months since was quoted at 275 to 285, has now fallen below 250, and, in fact, is to-day (October 26) quoted at 247.

Regarding the inquiries respecting cotton textiles, I will say that none are manufactured in this district, and the merchants, handlers of such as are here consumed, avow their inability to furnish the precise

technical information required by instructions.

As meager as I feel this report to be, it yet embodies all the information on the points touched that I have been able to obtain.

JAMES M. AYERS, Consul.

ROSARIO, October 26, 1898.

## Principal exports from Argentina for the calendar year 1898.

[Average weights: 1 bale wool=420 kilos (925 pounds); 1 bale sheepskins=450 kilos (992 pounds); 1 bale hair=450 kilos (992 pounds); 1 bale hair=450 kilos (992 pounds); 1 bale hay=50 kilos (110 pounds); 1 case butter=25 kilos (55 pounds); 1 pipe tallow=400 kilos (881 pounds); 1 hogshead tallow=200 kilos (440 pounds); 1 cask tallow=100 kilos (220 pounds)].

<sup>&</sup>lt;sup>1</sup> A similar statement has been received from Consul Mayer of Buenos Ayres.

#### LOCUSTS.

## [From the Buenos Ayres Standard.]

A law has been recently promulgated, defining the means to be adopted by the Government officials and citizens of the Republic for the destruction of locusts, and the entire question is of such moment in this agricultural country that it should be properly understood and not passed by with the careless mention and superficial observation that is meted out to many things.

First, let it be noted how little was thought about locusts, until some two years ago they appeared in the city and suburbs of Buenos Ayres, although they had ravaged parts of Santa Fe during several years, and must have been a periodical scourge in the country in earlier days, before agriculture was of importance.

Dwellers in town can not properly understand what destruction of crops means, and it is natural that they hear with indifference about what affects other people at a distance, but when myriads of locusts clouded the sky and alighted to disfigure local quintas, the object lesson was begun, and the newspapers were full of theories of the best methods of destruction, although most people had a sense of the impotency of human action. A few weeks previously, the leading merchants of Buenos Ayres had formed a committee and subscribed funds to obtain the best scientific advice on the subject, because it is no use to treat a disease till it has been properly diagnosed. There was at the time a prevailing idea that our locusts had some permanent breeding ground, from whence they emerged to maraud, although many people thought they came from distant lands, possibly from Mexico or Africe, and that it was useless to do anything. The best-informed people were quite at fault about the habits of locusts, until Professor Bruner's interesting and modestly written book appeared, giving the results of information gathered by the merchants, committee from many willing observers, who from all parts of the Republic answered the tabulated inquiries. Although further study is necessary, owing to the magnitude of the undertaking and the vastness of the country to be explored, Professor Bruner was able to establish on evidence some facts that are in the highest degree reassuring, and serve to save useless expenditure of money upon many impracticable methods.

The large migratory locust of the Argentine Republic was recognized as a separate species, and called "Schistocerca Paranensis" by Burmeister in 1861, and there is now no doubt that it is peculiar to the temperate regions of South America and is not a world-wide traveler. That being the case, it is of the greatest importance to know accurately its life history and to take advantage of habits that render it relatively easy of destruction, and possibly of annihilation. Most locusts of North America, like the "tucura" of the South, of this country, are, so to speak, grasshoppers and hard to catch, but the "Paranensis" species are migratory and gregarious, and from their habit of "bunching" comparatively easy to kill, especially during the earlier stages of existence. We will not attempt to define the methods of destruction, which are many, and it is very much a consideration of their most convenient and economical application; but, at any rate, we have very good authority for saying that the excellent work already done has had an appreciable effect, and that the swarms now appearing in the north of Santa Fe are fewer and smaller than last year.

The Government commission has recently published some revised "instruction" under this head, and, bearing in mind the excellent work done and the study of the question by many subcommissions, it is regrettable to find an erroneous statement to the effect that migratory locusts breed eight times or oftener every year. This statement can not have the authority of Professor d'Herculais, because it is an established entomological fact that our locust is normally single-brooded, although occasionally, there may be exceptions to this rule. Instead of inhabiting a permanent breeding ground, the Schistocerca Paranensis hibernates in the northwest and comes down in spring to lay eggs that develop into a fresh brood. This brood, after a period of continual hard eating, develops wings and ultimately flies away to remain in winter quarters about seven months and to become fully developed insects, thus completing the cycle of life in one year.

The region most frequented during winter seems to be northeast of Cordoba and Santiago del Estero and the north of Santa Fe and Entre Rios, but not the Chaco to any great extent. These regions are, so to speak, near at home, and if the energy already displayed in many quarters is continued and increased, there is little doubt that a terrible plague may be averted, or, at any rate, reduced to moderate proportions, by hard work and natural agencies, and without waiting for any heroic or sensational remedies. There is no doubt that many crops can be saved by using the methods of destruction now employed, and it will be a great pity if the work of destroying locusts is hindered by indifference or by neglect of an obvious duty, shown by people who are glad of any excuse to save themselves trouble and expense. Every locust killed may account for a possible brood of 70 to 120 in the following year, without reckoning the surprising amount of food required for its development.

#### THE DAIRY INDUSTRY.

#### [Paper by O. C. James.]

The dairy interests of the Province of Santa Fe are of very recent growth, and may be said to be in the transitory state from the purely pastoral. The incentive has not been so much an increased demand for butter, cheese, and milk, though this has been an important factor, as the more recent opening of the European markets for Argentine steers. A very little experience soon proved to the Argentine estanciero that he could not ship steers profitably to ports as distant as Liverpool, for instance, without taming the animals, and this necessitated tame dams, and the easiest mode of achieving this end was to divide the herds and allot a more or less greater number of cows to Italian or Basque families to be milked, the primary object being the speedy and healthy growth of steers for exportation. The cows were milked only in the morning and then sent to the pastures with their calves, the latter being separated from them in the evening and confined in small paddocks during the night. This system appears to attain the desired result The calves are continued on a milk diet much longer than if their dams were not milked by hand, and the mixed feed—milk and pasturage—keeps them in a thriving condition until the cows dry up, when they are prepared to continue their growth on grass alone.

At first, this milk was made up into cheese, but as the quality was not suitable for

At first, this milk was made up into cheese, but as the quality was not suitable for export the local market soon became overstocked and the attention of the producer was turned to butter making, English importing houses having their purchasing agents on the ground to instruct them in the matter of making, packing, and shipping. This system has not proved as profitable as would be supposed, on account of the isolated positions of the estancias, and the difficulty of making shipments of a uniform quality, a point of considerable importance to large dealers in England. The next step, obviously, was the establishment of great central factories, fitted with the most effective machinery and refrigerating installations known to science and mechanics, constructed and owned by the wealthy produce dealers of London. These were erected near the city of Buenos Ayres, and central skimming stations were established at various points on the railways—a great English company has seventeen of these stations on the Southern Railway alone—and from these, the cream is sent to the factory after having been reduced to the proper temperature, and is then made into butter for export. One factory is now making 4 tons of butter a day, and is establishing skimming stations wherever there promises to be a sufficient quantity of milk to justify the expense. One is now being erected in Las Rozas, in this Province, and doubtless, there will be many more springing up in every available or promising center on the railways running through the rich alfalfa districts of the province of Santa Fe.

The cows are rarely stall fed or given anything to eat besides the pasture of the rich fields of the pampas. Here, alfalfa grows more luxuriantly, perhaps, than in any part of the western continent. There are fields of alfalfa, leagues in extent—those of the Benitz Brothers, for instance, at estancia La California, near Las Rozas, which have been indiciously grazed for years, show no signs of deterioration.

which have been judiciously grazed for years, show no signs of deterioration. The establishment under my charge—the Carcaraña creamery—is rather exceptional in this country, from the fact that a high-class cheese is made, only Jersey cows and grades are kept, and they are milked morning and evening, the calves being orought up by hand. In fact, it is worked on the lines generally accepted by dairy farmers in the States, the only object being to get the greatest quantity of rich milk to be made into cheese, the raising of steers for export not being even a cellateral object. The cows are fed on ground feed—maize, bran, cured alfalfa, etc., to supplement the pasturage. Cheese is made to meet the home demand, though the export of the product has been tried and has promised success. The cheese made is that known as American cheddar.

## SUPPLEMENTARY REPORT.

Sugar.—The production of sugar in the provinces of Tucuman and Salta, from May to September of current year, amounted to 58,885 tons, of which 50,752 tons were produced in Tucuman, where sugar is the principal industry.

Freights.—Freight rates, though quiet on account of the descent of gold, are firm. The latest is now 21 shillings (\$5.10) in wheat charters

for February and March steamers.

Wool.—Wool stock accumulates quietly, with 9,000,000 kilos (19,841,400 pounds) on hand, of which 60 per cent is heavy cross. Market for all grades is steadily declining.

Cotton goods.—What are known as cotton (or canton) flannels all come from the United States. The other cotton goods of all grades

come almost exclusively from England and Germany.

Agricultural implements.—The most intelligent and thorough of the farmers of this district are the Swiss-Germans, and these obtain, as rapidly as they can afford to buy them, American agricultural implements, including threshers and engines. It needs only a season of tangible prosperity to increase this well-established demand, which our producers should be ready to meet here on the ground.

Immigration.—It is worthy of note that the Italian Steamship Company, controlling a line to the River Plate, is about to put on two additional steamers for the purpose of accommodating the increased

immigration that is expected here from Italy this year.

Outlook for crops.—Mr. H. B. Coffin, an American, and an eminent authority on agricultural matters, says, in speaking of the outlook for crops in his district (Carcaraña), "the condition of the crops is good, although late frosts would destroy from 10 to 15 per cent of wheat in flower. If locusts come now, they will be on the eve of depositing their eggs, and will do but little harm. The young take forty days to hatch and fifteen to twenty more to be able to do harm, and the wheat will then be beyond their reach. The maize in January will be more exposed." As Mr. Coffin is a member of the National Locust Commission, his statements are quite ex cathedra.

Coal.—Regarding the market for coal here, I have a note from the resident agent of the only United States coal that seems to have effected an entrance here in competition with the English (or Cardiff) coals, as

follows:

Pocahontas coal is at the disposal of our men-of-war at the following ports: Montevideo, La Plata, Buenos Ayres, Santos, and Rio de Janeiro, where a constant supply will be on hand from January 1, 1899. We have brought into the River Plate more than 15,000 tons for Argentine railways, and we now have 10,000 tons afloat for these markets.

This wedge has been inserted in the coal market by the company having sent a competent man here to travel and work up the trade. This has not been a matter of a few weeks or months, or an outlay of a few hundreds of dollars. Once in, on equal terms, the product will probably sell by its superior qualities. The same rule of striving for trade in many other lines would doubtless bring about like results.

Exchange.—The paper money of the country is rapidly appreciating in value, the fall in gold being quite sudden enough, under less favorable surroundings, to produce a financial panic. It has produced a quite

perceptible depression in business ventures.

JAMES M. AYERS, Consul.

Rosario, November 10, 1898.

## ARGENTINE AGRICULTURE IN 1898.

Consul Ayers writes from Rosario, January 23, 1899: I give below copy of a report made by Mr. William Goodwin to English correspondents, as to the relative condition of the wheat crop of this and former years. We agreed that a revised estimate of this season's crop would foot up an excess of 2,000,000 tons. Mr. Goodwin

Taken all around, 1898 has been a good year for Argentine agriculture, and there, have been no disasters. Prices of wheat and wool having been good and crops gen-

Digitized by GOOGLE

erally satisfactory, it is considered that the losses of previous lean years have been to a great extent covered, so that a fair start is now made and a cycle of good seasons may be expected, the principal assets carried forward being a splendid crop of wheat, safe in stack, unless we have heavy rains in January, and a large increase in the flocks and herds, with prospect of good maize crops, as well as plentiful grasses.

The fall in the price of gold has therefore been tempered to all concerned, and with another year, new conditions of rental and credit will be settled to suit the

improved currency.

Locusts do not cause so much alarm, now that the possibility of keeping their ravages within bounds in the cultivated districts has been demonstrated, and since it is known that their habitat is confined to the Republic, so that when they can be followed to their hibernating quarters the process of extermination will not be impossible. At any rate, the locust plague has taught individuals to do some work for public good without relying altogether on the Government. This new departure resulted from the action of a few Buenos Ayres merchants, who subscribed a large sum of money for the expenses of thoroughly studying the life history of the Argentine locust.

So many disappointments have resulted from efforts to forecast the wheat crop that we are all very shy of saying much this year, and the consequence may be low estimates, but it is now probable that the export of 1899 will be as large as in 1894 (1,600,000 tons) and may reach 2,000,000 tons, because there are no failures of crop

in any district and quality will be generally good.

The feature of the year will be the crop of Buenos Ayres province, of which the most glowing accounts are received, and if the yield is up to appearance, this item in the balance sheet will be of importance in the present export as well as in future cultivation, and will hasten the southerly trend of wheat growing.

The fall in gold cuts down the paper price received by growers very severely, but there will be a saving in the price of bags, thrashing, and railway freight that makes a considerable difference on the other side; and, after all, it is the yield that most

affects the result of a crop to a farmer.

The inclosed table, which is really calculated backward from the exports because there are no reliable statistics of acreage, works out in accordance with what was generally thought to be the yield each year, showing very great difference in various 80280DB.

It is not likely that wheat growing can increase materially, unless the improved condition of the currency or some other obvious inducement attracts a large immigration; but, on the other hand, there is no reason to expect any falling off, because the class of Italians who till the soil are not fitted for any other work, and will go on at their present occupation as long as they get the necessary food, with hope of occasional good years. Land they always get on some terms, while their requirements of living are so small that they can get along. As long as cheap land and cheap living are obtainable, this will be a wheat growing and exporting country.

Maize will always be cultivated, but the export will depend more on the condition of the cattle trade—always supposing that there is no great drought and consequent failure of crop—than on prices, because stock feeding will increase very largely with the improvement of the class of animals and the advent of mixed farming, and it is more convenient to export maize in the form of meat; but the future of wheat export is beyond doubt, because home consumption can not increase with production.

## Calculation of Argentine wheat crops.

[Copied from official report of authorized grain inspector of River Plate.]

Year.	Wheat and flour exported.	Consump- tion of flour and seed wheat.	Total crop.	Estimated acreage.	Yield per acre.
	Tons.	Tons.	Tons.		Bushels.
1890-91	405,000	440,000	845, 000	2, 700, 000	12
1891–92	495,000	485,000	980, 000	3, 300, 000	iī
1892-93	1,050,000	535, 000	1, 585, 000	4, 000, 000	144

GERARDO ZALLES, Vice-Consul.

LA PAZ, January 20, 1899.

# BRAZIL.

## REPORT FROM CONSULATE-GENERAL AT RIO DE JANEIRO.

On account of the absence of any official figures, it is impossible to give a detailed statement of the commercial movement of Rio de Janeiro for the first halt of the current year. A fairly correct approximation of the trade will demonstrate that, with the exception of one or two articles, imports have very considerably decreased in quantities. This fact is chiefly due to the severe financial crusis through which the United States of Brazil, or, more correctly, the coffee-producing States of Brazil, are now passing. The serious depreciation in the value of coffee, caused by overproduction, has reduced the purchasing power to such a degree that the utmost economy has been forced upon commerce in all its branches, and principally those which touch foreign markets.

A modification of the import duties stimulated the importation of some articles during the first quarter of the year, particularly cotton goods and Portuguese wines. But the alarming depreciation of the Brazilian currency embarrassed such of the dealers as had gold obligations maturing, and finally led to various failures, or suspensions, in which large sums were involved. In most cases these were compromised privately, and by this action, the actual amounts involved and the names of the parties interested were not allowed to be published.

Since last April, when the lowest point was touched (55d. per milreis), there has been a decided advance in the exchange value of the currency. This improvement is chiefly due to the "moratorium" obtained by the Brazilian Government in June from its (London) creditors, by which arrangement the payment of the interest on the foreign funded debt of Brazil and some other gold engagements has been postponed for three years. Speculation, ever on the alert, has further developed appreciation in the value of the milreis, which, on June 30, was quoted at 7½d. In other words, the gold value of the paper milreis advanced from 11½ to 15 cents. The injurious influence of these constant fluctuations in the currency upon commerce, and particularly upon the import trade, is self-evident, and the old experience repeats itself—the prices of the necessities of life are very slow to adapt themselves to the increased currency value. There is no change yet noticeable in the

<sup>&</sup>lt;sup>1</sup> In reply to Department circular of August 5, 1898.

prices of foodstuffs or clothing. It may be a long while before the benefits resulting from the appreciation of the currency will reach the

working classes.

It is probably due to recent bitter experiences that, notwithstanding the present advance in the gold value of the Brazilian currency, importers refrain from entering into large ventures. Many seem to fear a reaction, for which there is no lack of precedent in the later history of Brazil. While it must be acknowledged that there are earnest, and almost pathetic, efforts made on the part of Brazil's leading men to establish, or reestablish, this country on a sound economic basis, it can not be overlooked that they have to contend with grave difficulties, and the process of establishing a permanently sound and solid basis for commerce and trade must necessarily be slow.

Through an infatuation, similar to that which prevailed in our Southern States prior to the rebellion, when "cotton was king," the Brazilian planters in the great States of Rio de Janeiro, São Paulo, and Minas Geraes, intoxicated by the extreme prices that were ruling in the coffee market up to the year 1896, virtually abandoned the production of all foodstuffs, and concentrated all their efforts upon coffee culture. Hence all the ordinary articles of consumption had to be imported—imported, not, as it was the case with our Southern States before 1861, from different sections of the same country (one part of the nation buying from the other) but from abroad, which required payment in gold.

When the coffee prices were at their height, affording large profits to the producers and dealers, a great financial "boom" set in, which strongly influenced the commercial and industrial life of the whole nation. Fictitious values were created, large responsibilities and expenditures incurred by the Government, as well as by private enterprises, and when coffee, the great Brazilian staple, received its first serious check in 1896, the trade of Brazil was unprepared.

The value of coffee has steadily declined since, and the balance due foreign markets has been but slowly reduced. During the months of March and April of the current year, a general suspension of payments.

seemed unpleasantly near the import trade of Brazil.

The above-mentioned financial arrangement of the Brazilian Government averted this disaster. It is apparent that the credit of this country has suffered badly, but also that the severe experience of the past years will not be thrown away upon the Brazilian people, and will serve as a lesson for the future. Whatever they may have lost recently, the leading men have not lost their great resources, their intense love of country, and their ardent desire to rehabilitate Brazil in the eyes of the civilized world, and restore to it the confidence this country has always inspired abroad almost from the first moment it entered upon its national existence.

As a matter of necessity, the importation of some articles has been very much reduced—for instance, indian corn, which Brazil has heretofore imported in enormous quantities from the River Plate, notwithstanding the fact that two crops per annum can generally be obtained on its own soil. As to the other articles, only the quantities required for immediate consumption appear to have been imported.

The present period is certainly not very favorable for an attempt to extend the trade of the United States with Brazil. Not that I wish to discourage intelligent and energetic efforts in this direction; on the contrary. Now is the time to sow the seeds for a harvest to be reaped when the times become better. I would advise, however, for the present, the utmost prudence in new transactions. The success of our trade in

Brazil now depends less on the acknowledged superiority of the goods with which we come to this market than on the ability of the pros-

pective Brazilian buyers to pay for them.

Owing to the precarious conditions of finance and trade prevailing at present in Brazil, the realization of the cherished project of establishing an American bank here and a new steamer line between the United States and the ports of Brazil must necessarily be retarded. A much reduced import trade and a steamer freight rate of 10 cents per bag of coffee (110 lbs.) from Rio to New York, are facts not calculated to stimulate new American-Brazilian steamship enterprises.

#### TARIFF.

As to the Brazilian tariff, the financial condition of the Government has forced upon it a change nearly every year for the last eight years. In every case, the duties have been increased. During the past year a mixed commission of Government officials, merchants, and manufacturers organized the tariff that went into effect on January 1, 1898, a translation of which was transmitted to the Department of State by Minister Conger immediately after its publication.

But even this tariff has not produced the requisite revenue, and another increase will probably take place in a very short time. The present Congress will undoubtedly submit important changes, among which will be the proposition to collect a part of the import duties in

gold.2

# PATENTS, MERCHANDISE MARKS, ETC,

In reply to the circular of the Department of State, I have to report that there is no legal requirement in Brazil causing goods of foreign manufacture to be marked with a stamp of origin. Patent rights are granted upon application through the recognized agents here, and most articles manufactured in foreign countries are protected by their

registered trade-marks.

Cottons.—It is very difficult to obtain accurate information regarding the manufacture of cotton goods in Brazil, as this branch of the few home industries is almost exclusively controlled by foreigners-Englishmen, Germans, and Frenchmen-who guard the secret of their methods very jealously. The textile industry, particularly so far as the manufacture of cotton goods is concerned, has made some progress lately in Brazil. Cotton weaving is well established here, and most of the larger mills spin their own thread, or even furnish it to A large quantity of thread, some of it dyed, comes from abroad. But since 1895, the import of cotton goods into Brazil has steadily decreased, from 55,000 packages in 1895 to 26,000 packages in 1897. For 1898, the decrease is still more considerable, due partly to increased home production, partly to diminished consumption, forced by the "hard times." The import duties on cotton goods collected by the Brazilian Government were 115,186,940 milreis in 1896 and 88,187,113 in 1897, a decrease of 26,999,827 milreis. There are about \$15,000,000 invested in the Brazilian cotton industry, which employs about 200,000 operatives, mostly women and children. The wages are extremely low. Skilled and experienced men earn 5 to 6 milreis (75 cents to \$1), children 1 milreis, and women from 3 to 4 milreis a day of ten to twelve hours. As the Brazilian cotton is of a very fine quality and abundant, it will

<sup>&</sup>lt;sup>1</sup>Printed in Advance Sheets No. 64, March 18: Consular Reports No. 212, May, 1898.
<sup>2</sup> See Advance Sheets No. 267, November 7: Consular Reports No. 221, January, 1899.

be more difficult from year to year for the importers to compete with home industry. The low rate of exchange is particularly favorable to the cotton manufacturers here, and nearly all declared dividends for the first half of 1898.

Industries.—Excessive duties, stamp taxes, etc., have almost entirely banished foreign candles, matches, and beer. They gave way to the "national" product. The material, however, for those "national" products in each case comes from abroad; the chemicals, sticks, and boxes for matches all come—or until very recently have come—from Germany, whence come also the malt and the hops for the beer brewed in Rio, while nearly all the tallow used by the candle makers comes from the River Plata. This anomaly, which involves a serious loss in revenue to the Government, seems to attract but little attention.

In connection with the industries of Brazil, I desire to mention two American enterprises recently established here, each of which conveys an interesting object lesson—a branch of the Diamond Match Company and the refining works of the Standard Oil Company. In consequence of the very high duties on matches, the Diamond Match Company organized a stock company here for the purpose of establishing a branch factory. Prominent Brazilians were interested in the enterprise; machines were sent from the United States, and the manufacturing was begun on a large scale, to the satisfaction of all concerned. The Brazilians have a new national enterprise, the Diamond Match people the majority of stock, the price of matches has considerably decreased, and the profits are said to be very considerable. I have learned that similar branches have been established in the Argentine Republic and in Chile and Peru.

A gloomy contrast to this bright picture is presented by the venture of the Standard Oil Company. This company erected, in the immediate vicinity of Rio, on the Ilha do Governador, an extensive refining plant, costing about \$500,000. The works were put in operation in January, 1897, and up to January, 1898, refined 272,000 cases of crude oil sent from the United States. Their very prosperity seems to have been their misfortune. Special demands were made upon the management, and refused, when, suddenly and without warning, a tariff act passed the Brazilian Congress which brought the fine and expensive works to a standstill with a jerk. The duty on refined oil was lowered from 140 reis a kilo to 70 reis. The plant has been idle since the 1st of January. Whether it will ever resume its activity depends on the

next Congress.

# UNITED STATES TRADE.

As yet, American merchants and manufacturers are far from having their legitimate share of the Brazilian import trade, and they have to work for it with the same tenacity and thoroughness as their European competitors, who came here many years before them. In this connection, I desire to reiterate what I have said in former reports—the practice of trying to attract business by compiling comprehensive catalogues is absolutely useless here. They would serve their purpose only if an agent who speaks the Portuguese language fluently would present them.

An American trade paper published here in the Portuguese language, or judicious advertising in the local press of Rio, would far better serve the interests of American trade. Americans must remember, however, that Spanish is quite as much a foreign language as English in Brazil. So many of those that come here trying to represent Amer-

ican interests are helpless, because they speak neither Portuguese nor French. The Europeans doing business in Brazil as a rule speak English and German, besides Portuguese and French, which fact is, of course, greatly to their advantage.

I inclose a list showing the quantities of the leading articles imported in 1897 and 1898. The very remarkable decrease in the imports is partly due to diminished consumption, partly to an increased home

production.

That the justly celebrated American hams cut such a small figure here is principally due to the fact that they are not packed appropriately for the Rio market. I was assured that a great many of the so-called English hams sold here originated in Chicago packing houses. They go by way of England solely for the purpose of being repacked there to suit the Brazilian climate.

Of the 532,437 tons of coal imported here in 1897, only 14,405 came from the United States. These were imported for the gas works, and not a pound went to a dealer. As American coal need not fear a fair competition in this market, I have endeavored ever since my arrival here, last January, to help secure for it its legitimate share of the trade, and I think I will soon be able to show results.

For further details and suggestions as to trade and commerce in Brazil, I beg leave to refer to previous reports to the Department of State.<sup>1</sup>

### EXCHANGE.

The table of exchange values I give below affords an interesting study to financiers and exporters. I may add that the present rate of exchange, low as it still is, will probably not remain at its present figure very long. A downward movement is expected by many toward the end of November.

Foreign exchange at Rio in 1898	Foreign	exchange	at	Rio	in	1898

The steamship lines to and from the United States have formed a trust and adopted a uniform schedule of freight for the transportation of coffee from Santos and Rio to the United States. Until recently they charged 40 cents per bag of 60 kilos (110 pounds), then they reduced their rate to 15 cents, and since the middle of September their freight rate is 10 cents per bag of 60 kilos.

#### PORT CHARGES.

Light dues, 100 milreis (gold) or \$5.46; hospital dues, 1.920 milreis (26 cents) each man of the crew, including officers, and also 18 milreis (\$2.52) for each vessel; pass fees, 9.800 milreis (\$1.37).

Stamp duty on freight (outward), 4 and 10 per cent. These charges are all in paper currency, except light dues, as above.<sup>1</sup>

### PORT REGULATIONS.

A vessel coming in has to wait at the free port for the visit of health and customs officers, who have to examine bills of health issued by the Brazilian consuls abroad and to receive the consular manifests and all other papers referring to the ship's cargo. When all has been found in order, the captain is allowed to proceed to the final anchorage, where the discharge can begin as soon as all the custom-house papers are ready. Steamers belonging to regular lines and enjoying packet privileges can begin discharging and loading as soon as the ship's papers have been found in order, and need not wait until the custom papers are ready.

During the winter time, i. e., from April to November, vessels are allowed to discharge and load alongside the wharves and warehouses.

General cargo is almost always discharged into lighters and thence into the custom-house, or warehouses, called "trapiches."

Bulk articles are discharged on shore direct during the winter months. Coffee is received into lighters and transported to the vessels.

### RAILWAY COMPANIES.

The Estrada de Ferro Central do Brazil and the Leopoldina Railway

Company, Limited, provide means of communication by land.

The freight on goods is subject to charges according to the rise or fall in exchange. This applies to both the above lines. Printed tariffs are issued from time to time.

EUGENE SEEGER, Consul-General.

RIO DE JANEIRO, October 15, 1898.

## BRAZILIAN TRADE IN 1898.

At the beginning of the year 1898, the financial horizon of Brazil was covered with dark clouds. Everybody seemed to feel that a disaster was approaching. Political difficulties of a serious nature added to the dangers of the already critical situation, and, to cap the climax, the price of coffee, Brazil's great staple, went steadily down.

price of coffee, Brazil's great staple, went steadily down.

England, Brazil's chief creditor, became alarmed. Brazilian 4 per cent bonds were quoted at 42½ in London in the latter part of April, and, after a slight reaction, at the same price in May. The foreign banks here withdrew their funds as fast as practicable, and are said to have remitted to their European offices not less than £1,000,000 during the first four months of the year.

There was no doubt that only heroic measures could save the country's finances from utter wreck, but no agreement could be reached as to the method and direction to be adopted. Some of the rural press and a certain element in the cities were clamoring for a suspension of the interest on the foreign debt. Importers complained that the

<sup>&#</sup>x27;The value of the paper milreis may be estimated at about 14 cents; the gold milreis is valued at 54.6 cents.

national treasury was absorbing an excessive part of the exchange furnished by the exports of the country. To this, the official organs replied that the necessities of the Government abroad (the interest on the debt) were known, and the imports ought to have been curtailed. In the month of May a committee, appointed by an influential association known as the "Centro Commercial" (headquarters at Rio), visited President Moraes and handed him a memorial, in which the suspension of the payment of interest on the foreign debt was not exactly advocated, but very plainly hinted at. President Moraes answered that the Government was successfully negotiating with parties abroad for a financial arrangement which would ameliorate the financial strain under which the nation was suffering. From this declaration dates the beginning of the improvement; it terminated the acute stage of the crisis.

The result of those negotiations was the often quoted "moratorium," a contract between the Brazilian Government and its (English) creditors, signed June 16, 1898, which provides that the interest on the funded foreign loans during the next three years should be paid in five per cent bonds. The interest guaranties to railroad companies operating in Brazil with English capital were included in this arrangement. It would be an exaggeration to say this contract gave universal The optimists were disappointed; the pessimists more satisfaction. than pleased. It was certainly the best that Brazil could obtain, and the fact that the exchange market was relieved, at least for three years, of Government interference, to the extent of about £3,000,000 a year, was a decided immediate gain. It was a herculean task for the minister of finance to annually convert enough of the revenue—received in irredeemable and depreciated paper money—into gold, to meet the requirements of the foreign debt.

The arrangement with the London creditors necessitated some similar measure with the holders of gold loans in Brazil, and in June, a decree was published reconverting into bonds, earning 5 per cent paper, some 140,000,000 milreis that in 1890 had been converted from 5 per cent paper interest to 4 per cent gold interest. A premium of 22 per cent was offered the holders of this debt, and the result of the transaction was guaranteed by the banks of Rio. It was perfectly successful, for only some 500,000 milreis were presented for payment, which, in accordance with the law of 1890, were payable in currency. This reconversion left only the 1868 gold loan and the 1889 gold loan, both held in Brazil, to be treated, and authority to enter into some agreement with the respective holders was granted by Congress as an extra clause in

the budget law of 1899.

The following table shows the state of the funded debt of Brazil on December 31, 1898:

Foreign total	£35, 758, 364
Domestic, currency milreis	491, 619, 100
Domestic, gold, loan of 1868dodo	11, 584, 500
Domestic, gold, loan of 1879do	24, 679, 000
Domestic, gold, loan of 1889dodo	109, 694, 000

The 1897 loan had been largely transferred to Europe, and was included in the London contract. Of the 1889 loan, only 18,350,000 milreis are in circulation, the balance being held by the treasury, which purchased it with gold deposited by banks of issue, whose privilege was afterwards canceled.

Of course everybody understands that the "moratorium" does not

constitute a solution of Brazil's great financial problem, but merely an opportunity for solution. The next important step is economy and reform in the National Government, and President Campos Salles stands publicly pledged to it. His great administrative ability is acknowledged everywhere. If it is true, as generally rumored in business circles, that since December, negotiations have been pending in London with a syndicate backed by the Rothschilds for the sale or lease of the great Central Railroad of Brazil (a very valuable Government property, although for various reasons unproductive of late), and that these negotiations are likely to come to a satisfactory conclusion, Brazil will leap from financial misery into prosperity at once. There would be a sharp and sudden rise of exchange and Brazilian securities, the currency would reach a stage of reasonable stability, and commerce and trade would recover from their feverish condition and become normal.

At the commencement of the year of 1899, these net gains are apparent: Inauguration of governmental reforms; strongly increased confidence at home and abroad; and a fair foundation for a sound money system, through the 10 per cent gold duties collected under the new tariff law.

#### IMPORTS.

The tariff law of 1898 evidently favored some articles, particularly manufactures of cotton, and wines of a certain alcoholic degree, imports of which increased considerably during the year, even before the levying of 10 per cent in gold on foreign imports came up for discussion. In other articles, the receipts nearly all show a decrease as against the figures for last year, although, either because of the rise in exchange during the last quarter or because stocks became very much reduced, there was an increase during this period. The imports of cotton goods were particularly large in November and December.

Here are some details concerning the imports:

Beans and pease.—The receipts were 94,136 bags of foreign against

106,447 bags in 1897. No quotations are furnished.

Beer.—The light beers of native production, aided by the duties, have nearly driven foreign beer out of the market. The total receipts in 1898 vere 1,190 packages, of which 1,097 were British, against 3,045 packages in 1897. Guinness' stout was quoted from 22\$000 to 23\$000 (\$3.15 to \$3.22) per dozen.

Butter.—France supplies the greater part of this article. In 1898, the total receipts were 44,479 cases, of which 32,517 cases were French, which were quoted at 2\$600 to 3\$060 (36 to 43 cents) per half kilo. In

1897, the receipts were 51,243 cases.

Candles. — The domestic article also competes sharply with the imported. In 1898, receipts were 5,898 cases against 10,962 cases in 1897. Prices ranged from 840 to 860 reis (11.7 to 12 cents) per packet for common to 940 to 960 reis (13.1 to 13.4 cents) for the better qualities.

Cement.—Belgium is one principal source of supply. In 1898, of a total importation of 135,960 casks, 86,902 casks were Belgian. In 1897, receipts were 196,790 casks. Quotations varied from 19\$000 to 21\$000 (\$2.66 to \$2.94) per cask for British to 12\$500 to 15\$000 (\$1.75 to \$2.10) for Belgian.

<sup>&#</sup>x27;Taking the market value of the Brazilian milreis as 14 cents.

Codfish.—The receipts in 1898 were 125,870 packages, or 45,057 packages Canadian or Newfoundland; 28,871 Norwegian, and 51,942 sundries, the last being for the most part Newfoundland fish shipped via New York. In 1897, the total imports were 150,395 packages. During the year Canadian fish varied between 40\$000 to 60\$000 (\$5.60 to \$8.40) per drum, and Norwegian from 50\$000 to 65\$000 (\$7.00 to \$9.10) per case.

Flour.—The imports of foreign for 1898 were 273,137 barrels, against 336,533 barrels in 1897. The two local mills produced the equivalent of 645,250 barrels, against 584,707 barrels in the preceding year. American flour was quoted at the extremes of 35\$000 to 80\$000 (\$4.90 to \$11.20); River Plate from 28\$000 to 73\$500 (\$3.92 to \$10.29), and domestic flour from 33\$000 to 80\$000 (\$4.62 to \$11.20) per barrel.

Hay.—Receipts were 285,987 bales, against 286,033 bales in 1897, all from the River Plate. Extreme quotations were 125 to 250 reis (1.7 to

3.5 cents) per kilogram (2.2 pounds).

Indian corn.—In 1898, imports of foreign were 422,286 bags, against 1,254,097 bags in 1897. Prices for River Plate corn varied between 7\$300 (\$1.02) and 12\$000 (\$1.68) per bag of 62 kilograms (136 pounds).

Kerosene.—Receipts were 430,286 cases, against 475,767 cases in 1897, and extreme quotations were 8\$500 to 16\$000 (\$1.19 to \$2.24) per case.

Lard.—The imports reached 161,455 kegs and 16,434 cases, against 128,285 kegs and 13,735 cases in 1897; a quantity of lard in pails was also received. Prices for American ranged from 640 reis to 1\$200 (8.9 to 16.8 cents) per pound.

Pine, pitch.—In 1898, the receipts were 26,018,837 feet, against 25,940,429 feet in the preceding year. Quotations were 74\$000 to

87\$000 (\$10.36 to \$12.18) per dozen of 378 linear feet.

Pine, spruce.—The receipts were 4,575,161 feet, against 6,095,115 feet in 1897, and the extreme prices quoted were 83\$000 to 90\$000 (\$11.62 to \$12.60) per dozen of 378 linear feet.

Pine, white.—The imports amounted to 5,174,312 feet, against 5,830,964 feet in the preceding year. Extreme quotations were 180 to

320 reis (2.5 to 4.4 cents) per foot.

Pork and bacon.—Under this head are included only the supplies from the United States. A considerable quantity of English-cured bacon is received, but the custom-house appears to have included it under the class of hams. In 1898 the receipts were 18,102 barrels, 3,900 half barrels, and 1,037 cases, against 52,104 barrels, 14,207 half barrels, and 9,777 various packages in 1897. American pork comes into direct competition with the native article, and the smaller supply most probably was caused by an increased production in the country. Extreme quotations for foreign during the year were 1\$380 to 2\$100 (19.3 to 29.4 cents) per kilogram (2.2 pounds).

Rice.—The receipts were 1,118,342 bags from Rangoon and 11,982

Rice.—The receipts were 1,118,342 bags from Rangoon and 11,982 bags via Europe; total, 1,130,324 bags, against 1,237,277 bags in 1898. The extreme quotations, per bag of 60 kilos (132 pounds), were from

20\$000 to 24\$000 (\$2.80 to \$3.36).

Rosin.—In 1898, the imports were 21,289 barrels, against 21,346 in 1897. Prices varied from 21\$000 to 26\$000 (\$2.94 to \$3.64) per barrel

of 280 pounds, according to quality.

Spirits of turpentine.—In 1898, the receipts were 9,380 cases, against 7,914 cases in the preceding year. Extreme quotations were 1\$000 to 2\$500 (14 to 35 cents) per kilogram (2.2 pounds).

Wine.—The imports were received from the following countries:

	1898.			1897.		
Countries.	Quartos.	Barrels. Cases.	Cases.	Quartos.	Barrels.	Cases.
France	4, 1 <b>69</b> 6, 773	57 1, <b>46</b> 5	6, 627 4, 833	3, <b>983</b> 5, <b>477</b>	231 1, 715	6, 678 7, 295
0			18	98.	18	97.

Only the common Portuguese and Spanish wines are quoted in the market, and the extremes in 1898 were, per pipe, 250\$000 to 500\$000 (\$35 to \$70), according to quality.

The following were also imported:

Article.	From the United States.	From all countries.
Beans and pease         bags           Beer         packages           Butter         cases           Flour         barrels           Kerosene         cases           Lard         packages           Pine, all kinds         M feet           Pork and beans         packages           Rosin         barrols           Spirits of turpentine         cases           Wheat         tons           Cotton goods         packages           Coal         tons	29, 840 115 1, 300 213, 837 430, 286 180, 025 32, 186 23, 039 21, 261 9, 340 10, 159 1, 388 25, 327	94, 136 1, 190 44, 479 273, 637 490, 286 180, 025 35, 768 23, 039 21, 289 9, 390 83, 112 46, 618 575, 835

As I have reported before, an American firm (the Toms Creek Coal Company) was the lowest bidder for furnishing 120,000 tons of coal for the Central Railroad of Brazil, owned by the Government, but it somehow or other did not obtain the contract, although it offered all the security requisite for the fulfillment of the contract according to the official specifications. There is no doubt, however, that in the near future American dealers will succeed in securing a fair share of the Brazilian coal trade. Unfortunately, no reliable statistics are available here regarding the import of American manufactured goods. A steady increase in this direction is noticeable, especially in machinery, electrical goods, glassware, optical instruments, plated and metallic ware.

# COFFEE.

The year was very unsatisfactory to the dealers, or, as we would call them, the "jobbers," who serve as middlemen between the factors (who receive the coffee from the planters, and have only a slight interest in maintaining prices) and the exporters, who naturally endeavor to purchase as cheaply as possible. The dealers are therefore called upon to lock up considerable sums in the purchase of coffee from the factors, and must await the demand from the exporters, thus exposing themselves to all the vicissitudes of the market, not only that of coffee, but also the exchange market, the fluctuations in which are incessant. The monthly extremes of prices were not excessive, save in April, when, under the belief that an import duty on coffee was imminent in the United States, a sharp demand sprung up, which caused an advance to 15\$600 (\$2.18) per arroba of type No. 7, but, as the rumors of duty

proved baseless, a serious decline ensued. The extreme prices for No. 7 during the year were 9\$000 to 15\$600 (\$1.26 to \$2.18) per arroba, against 10\$800 to 16\$000 (\$1.51 to \$2.24) in 1897, and 13\$500 to 21\$700

(\$1.89 to \$3.03) in 1896.

The planters showed great uneasiness under the steady decline in prices, which has now extended over nearly three years, and raised the usual complaints that they were reduced to poverty. When, however, their attention was called to the very large amount in currency, quite 400,000,000 milreis (\$56,000,000), that the last Rio and Santos crops must have placed in their hands, and it was suggested that their cry of poverty might produce a bad effect on the foreign markets, the complaints decreased and finally ceased. What the past crop really produced as a net result to the planters it is impossible to estimate, but the average price during the calendar year, paid by exporters, was about 11\$600 (\$1.62) per arroba, which must certainly have left some profit. A long extract, published from the report of an agricultural company, shows that 55,000 arrobas of coffee in 1898 produced in milreis about the same result as 26,653 arrobas in 1896; or, in other words, the planters had produced sufficient in quantity to offset the reduction in price, and the argument that speculation, and not overproduction. was the cause of the recent decline in prices, was refuted by these figures.

The wide difference between official crop estimates and the actual output was also a serious factor. The past crop for the Rio zone was estimated at 3,600,000 bags; the quantity sent from the port was 4,721,000 bags; the Santos crop was estimated at 5,000,000 to 5,500,000

bags, and 6,053,000 bags were shipped.

The estimates for the present crop (1898-99) are given at 6,750,000 bags for Rio and Santos, and are undoubtedly too low. Information received from well-informed persons leads me to believe that the following figures will be more nearly correct:

Santos district	3, 000, 000
Total	10, 000, 000

The following figures show the movement during the past three years in bags:

#### EXCHANGE.

During the first quarter of the past year, the position of the market A deep seated feeling of distrust was apparent, was very critical. which induced everyone to convert whatever currency he possessed into gold or foreign exchange, and, as mentioned above, the banks were also large takers. In April, 1 milreis was exchanged for 57 pence sterling, and when May opened the prospect was very gloomy. seriously discussed whether debtors upon documents payable in gold were not justified in refusing payment, and many dealers did refuse, but the banks holding these obligations did not seem inclined to proceed to extremities. Discounts were not to be obtained and some rather important failures resulted, but in nearly all cases the creditors either accepted a compromise or granted "extensions." The doubt in most minds seemed to be whether the Government would suspend the service of the foreign debt, confessing its inability to pay (in which case, whatever foreign money had not already left the country would have been withdrawn) or whether the service would be continued at any cost. In this case, a further issue of paper money was inevitable. Finally, in May, the interview with President Moraes, to which I have previously referred, took place. Immediately thereafter the reports were spread regarding the negotiations in London, which terminated in the contract of June 16, and the exchange market showed signs of recovery. But the speculators for lower rates seemed incredulous until, on May 26, the terms of the contract were virtually known here, and a panic resulted that ruined many of the purchasers of bills at low rates, and considerable losses were also incurred by brokers and others who had sold to these speculators, buying bills against the sales in order to realize profits, and who found themselves with these purchased bills, which could only be disposed of at heavy losses. It was a cruel lesson, but served to clear the market of a class of speculators who had certainly exercised a baneful effect on rates.

After a period of quiet, the speculation for higher rates commenced in September and was continued all through October, in which month the milreis was sold at 8½ pence, but great distrust was manifested as to the result of this speculation, which, based on sentimental and not commercial reasons, ultimately resulted in the decline in rates that was registered in November and December, the year closing with the gold

value of the milreis very undecided.

It has to be borne in mind that the currency of Brazil is irredeemable paper, and its gold value depends entirely upon the supply and demand. When a large business is done in produce for export, the shippers have to sell their drafts on foreign centers and purchase currency. When importers have obligations to meet in foreign markets, they must sell the currency which has been obtained for their merchandise to purchase gold or its equivalent payable abroad. The value of the milreis there fore depends almost exclusively on what is known as the "balance of payments" (balance of trade), and it is upon the uncertainty of this that the greater part of the speculation in exchange here is based. Now, the depreciation in the value of coffee in consuming countries neutralized the increased quantity exported, and upon coffee, with some assistance from rubber, the settlement of Brazil's foreign indebtedness depends. The needs of the Government were estimated at about £5,000,000 per annum for meeting its foreign engagements, leaving an insufficient amount for the necessities of other remitters (merchants, holders of securities who live abroad, etc.), and the result was that there was always competition in the market between the Government and the other exchange purchasers, which naturally tended to reduce the value in gold of the paper milreis and afforded speculators opportunities of which they were not slow to avail themselves. Under the contract for suspending the cash payment of interest abroad, the Government's annual necessities are reduced to about £2,000,000, and this amount, or at least the greater part of it, it proposes to employ the importers to collect by the payment of a percentage (10 per cent) in gold on the duties on foreign goods. No increase in the actual supply of sterling is secured, it is true, but the competitors in the money market are reduced, and from this, it is generally expected that increased steadiness will be imparted to rates of exchange. It is too early to say to what extent this purpose will be reached, but already there appears to be less tendency toward the violent fluctuations which are the speculator's delight and the importer's despair.

The extreme rates for bankers' bills during the year were the following:

London, ninety days	5# to 8# pence per milreis.
Paris, ninety days	1\$075 to 1\$697 per franc.
Hamburg, ninety days	1\$327 to 2\$098 per mark.
New York, at sight	5\$650 to 9\$011 per dollar.

#### SHIPPING.

The few opportunities afforded vessels to secure outward cargoes in Rio—owing principally to the exports being restricted to coffee, an occasional cargo of salted hides, and partly to the monopoly exercised by the English steamer trust over the coffee shipments—are gradually reducing both the number and the tonnage of vessels arriving at this port. As a rule, larger steamers are displacing the small ones on the European routes, but generally, these lines only use Rio as a port of call, and terminate their voyages at the River Plate.

The following table gives a summary of the arrivals and departures of foreign vessels:

Flag.		Arr	ivals.		Flag.		Depa	rtures.

I am obliged to add a very unpleasant postscript to the foregoing report. During the last two weeks, the Brazilian currency has again

steadily decreased. Since February 17, the milreis has fallen from  $7\frac{5}{16}$  to  $6\frac{7}{4}$  pence, the quotation of to-day, February 25, and it is impossible to say when this will end.

EUGENE SEEGER, Consul-General.

RIO DE JANEIRO, February 25, 1899.

## THE STATE OF PARANÁ.

Consul-General Seeger sends from Rio de Janeiro, under date of July 25, 1898, the following description of Paraná, prepared by Mr. Emil Thon:

The area of the State of Paraná is about 280,000 square kilometers (180,119 square miles). It can be divided, topographically, into three distinct regions:

1. The coast country, low, warm, and subject to fevers.

2. The plateau of the Campos Geraes, separated from the preceding by the mountains of the Serra do Mar, and extending eastward to the headwaters of the Tibagy, the Trahy, and other tributaries of the Paraná. These table-lands have a mild and healthy climate and a very productive soil.

3. The basins of the tributaries of the Paraná: This region has an altitude varying from 200 meters (654 feet) on the margin of the Paraná, to 700 meters (2,289 feet) on its eastern borders. The climate is gen-

erally warm, the soil rich and suited to all tropical products.

Of the numerous rivers which water this great State, the Paraná is the most important; from the falls of the Sete Quedas up, it is navigable at all times. It forms, with the Tibagy, the Pieté, the Paranapanemá, the Rio Brilliante, the Toinheima, the Toahy, and the Piquiry, a large system of navigable water courses.

The Rio Iguassú, in the southern part of the State, is navigable only between Pto. Amazonas and Porto da Umaō, being interrupted in its further course by numerous falls and rapids. There are now six

steamers trading on this river.

### NATURAL PRODUCTS.

#### MINERAL KINGDOM.

It is quite impossible to give an accurate description of the mineral wealth of this State, no systematic exploration of its territory having been made until now. What is known to day may be summarized thus:

Diamonds.—These gems abound in the valleys of the Tibagy and of

the Tordao, a tributary of the Iguassú.

Gold.—This has been found in various parts of the State. The engineers José and Francisco Keller found gold as well as diamonds in the Rio Tibagy, above the Aparado Falls. Some samples of this metal have been shown in Curityba, coming from Campo Largo, Votuverava, Saō José dos Inihaes, and Rio Negro. Auriferous sands were formerly worked in the beds of the rivers flowing into the bay of Paranaguá; they seem to-day to be completely exhausted. Some silver, too, was found in the Serra da Prata, south of Paranaguá.

Iron.—This metal is very abundant in every part of the State. In the vicinity of Antonina there exists a mine (about 12 miles from the city) which would produce, if worked, over 70 per cent of pure iron, as

good as any from Sweden.

Copper.—Large quantities of copper are to be found in the valley of the Toahy, where it occurs in enormous deposits of nearly pure metal. It has also been found on the margin of the Paranapanema, and in Guarapuava, on the banks of the Rio do Cobre, a tributary of the Rio Piquiry.

Lead.—In the Serro Azul region, and in the whole valley of the Rio Ribeira de Iguape, there have been found deposits of lead, as well as of

tin and antimony.

Quicksilver.—This has been found in the immediate vicinity of Paranaguá and near the Tibagy. A mine of some importance was discov-

ered lately, near Palmeira.

Coal.—This can be seen in large deposits in Lapa, Saõ José da Boa Vista and especially in the vicinity of Ponta Grossa and at the mouth of the Toahy.

Petroleum.—On the banks of the Rio Negro, and especially on those of the Iguassú, there exists much petroleum and other substances coming from bituminous schists.

Alum.—This abounds in the vicinity of Ponta Grossa and of Tibagy. Niter.—This is to be found in large quntities near Jaguariahyva.

Mineral salt.—Dr. Joao Mauricio Fabre discovered very rich mines

of this salt on the banks of the Toahy.

Marble.—Large deposits can be seen in Paranaguá, Guarapuava, Curityba, and Serro Azul. Important quarries have been opened lately in Arraial Quemado.

Kaolin.—This is found in the suburbs of Curityba and near the villa

of Iguassú.

Granites and sandstones.—These are largely distributed all over the State.

#### VEGETABLE KINGDOM.

The State of Paraná possesses an opulent flora. The trees and plants, which could be of inestimable value to the yet undeveloped industry of

this State, are numerous.

Above all others must be noted the pinheiro (Arancaria brasiliensis), the monarch of the Paraná forests, at home on the whole extent of the plateau of Campos Geraes. Numerous sawmills have already been erected, principally in the district of Piraquará, which furnish nearly all the lumber used in the State. With some initiative, this industry could readily be enlarged and its product find a ready market.

Beside the pinheiro may be noted for the excellency of their timber, the imbuia (Bignoma paranaensis), cedro (Cedrella brasiliensis), taroman (Cytharexylon cinereum), peroba (Aspidospermum peroba), angelim (Andira anthelmintica), araribá (Araribá preciosissima), jacarandá (Machaerium incorruptibile), guarajuba (Vicentia cincinata), cannelas (Nectandra), ipé (Bignoniá Tecoma), gequitibá (Carianiána), louro (Cryptocaria amara), monjolo (Pithe colobium), angico (Acacia virginalis), cambará (Lantana camara), cabiuna (Dalvergia nigra), carvalho (Quer cus), catinguá (Trichilia catinguá), cajarana (Cabralea cajarana), figueira brava (Ficus doliaria), sassafraz (Ocotea cymbarum), guaraetá (Chrysophillum), massaranduba (Minnesops elata), guanandy (Calophyllum brasiliensis), orucuarana (Miesonyma alchernoides), aroeira (Astronium arundeuva), guarapé (Weimnannia hirta), oleo (Myrospermum ery throxylum), and cipó florao (Bauhinia paranaensis).

Among the medicinal plants may be noted: Salsaparilha (Smilex paranansis), japecanga (Smilex japecanga), ipecacuanha (Cephalis ipeca), avenca (Adianthum capillus), artemisia (Artemisia vulgaris), velame (Croton campestris), cipó mil-homens (Aristolochia cymbifera), cipó-sumo (Anchietea salutaris), cipó-timbo (Paulini aprimata), abutua (Cocculus cineraceus), açafrão (Zinziber chrysanthum), gengibre (Zinziber), herva de lagarto (Adeneropium opiferum), losna (Artimisia absinthum), herva de Santa Maria (Chonopodium ambrosidivis), poejo (Mentha pulejeum), stramonio (Datura stramonium), cidró (Verbena triphylla), alfazema (Lavandula spica), salva (Salvia officinalis), malva (Malva rotundifolia), trapoeraba (Tradescantia duiretica), herva cidreira (Melissa officinalis), herva de Santa Luzia (Euphorbia brasiliensis), tanchagem (Plantago), herva-tostaõ (Bocaharia hirsuta), baunilha (Vanilla aromatica), and espelina (Perianthopodus espelina). The last has been recommended by Dr. Mauricio Faivre as a specific against epilepsy and poisoning.

### POPULATION.

The population of the State of Paraná was given officially in 1892 as 249,700, but in all probability exceeded these figures. It can be stated, in all security, that the present population is not less than 320,000 inhabitants. Of these, 56,000 are foreigners, living in 38 different colonies and belonging to the following nationalities: 32,000 Poles, 5,000 German-Russians, 12,000 Italians, 3,000 Germans, and 4,000 others.

About 60,000 more are foreign born and live principally in the towns. The capital of the State, Curitiba, in 30,000 inhabitants, counts 4,000 Germans, as many Italians, about 2,000 Poles, and 2,000 to 3,000 others—

Portuguese, Spaniards, etc.

The immigration of European colonists, though small, tends to increase rapidly.

Immigration has been as follows:

1890	 2,811
1891	10, 8 <del>44</del>
1892	 984
1893	 273
1894	 67
1895	 6, 331
<b>189</b> 6	 13, 048

The population of the principal towns of the State is approximately the following:

Paranagua Ponta Grossa Castro	8, 000 7, 000 4, 000	Palmeira	2,000 2,000 2,000
Antonina	4,000	Lapa	2,000
Rio Negro	3,000	São Matheos	1, 500

Nearly the whole population of Paraná is to be found in the eastern part of the State. The vast and fertile regions of the west are not inhabited by more than 30,000 people, not including some tribes of savage Indians.

### AGRICULTURE.

The agriculture of the State is almost entirely in the hands of foreign colonists, who cultivate principally sugar cane, corn, beans, potatoes, wheat, oats, barley, buckwheat, alfalfa, etc.

In the Italian colonies of the vicinity of Curitiba, much progress has been made in vine culture, which promises to be one of the principal industries. On the plateau of the Campos Geraes, despite the fertility of the soil, corn and beans are the only products of importance, though it is often necessary, in order to meet the home consumption of those articles, to import from Santa Catharina and Rio Grande.

The culture of coffee has taken large proportions in the northeastern part of the State, in the zone adjoining the State of Saõ Paulo.

Tobacco grows well in all regions and gives the best results.

Some attempts have been made to acclimatize the silkworm, and the State has distributed premiums to encourage this industry. Some samples of this silk have already been sent to Europe, where its quality has received full acknowledgment.

Cattle raising, though important already, could be made one of the chief resources of the State, owing to the pasturages abounding everywhere. Some 30,000 head of cattle are annually sent to the markets of Sao Paulo from the interior of Paraná.

### EXPORTS.

The principal article of exportation of the State of Paraná is the mate or tea of Paraguay. All of it goes to the markets of Buenos Ayres, Montevideo, and Chile, where it has taken the place of ordinary

tea, to the obvious advantage of the consumers.

Mate grows naturally on the whole extent of the plateau of the Campos Geraes, as far as the Paraná River. This industry is yet a primitive one; mate is sent from the interior, somewhat dried and without any preparation, to the mills of Curitiba (about 20 in number) and Antonina. There it is subjected to different manipulations to dry it thoroughly and reduce it to powder or to very small particles. Packed in barrels, it is then sent to the La Plata markets.

The export of mate in the last few years has been:

	Pounds.
1891	40, 504, 726
1892	42, 885, 535
1893	
1894	
1895	
1896	55, 333, 101
1897	40, 768, 241
4001	10, 100, 111

The export of lumber to São Paulo has grown of late, though it is yet insignificant as compared with the home consumption. This industry has undoubtedly a bright future, owing to the vast forests of pinheiro that cover the State. Other articles, like wax, honey, hides, and bones, are beginning to be exported, and will certainly form an important item in the next few years.

### IMPORTS.

The wholesale trade of Curitiba being almost entirely in the hands of Germans, Germany takes naturally the first place as to the value of its importations. England is a good second, while France and Italy

contribute only a small proportion of the total imports.

The United States furnishes to this State only those goods of which it has the monopoly, as kerosene, lard, flour, etc. (the two last in competition with the home and La Plata products). Among manufactured articles worth mentioning are a few agricultural implements and machines (steam engines and sewing machines principally). These goods are usually not imported direct, but through the intermediary of Rio firms.

A good deal more could be done if American firms would pay attention to southern markets. Instead of doing what Germans and Englishmen do—sending travelers able to speak the language of the country, and well supplied with samples of all their goods, with full powers to sell and conclude arrangements, and giving long credits—they content

themselves with sending a few catalogues, through the agency of New

York firms, and expect thereby to obtain good results.

It is absolutely necessary to United States trade that we enter into more intimate relations with this country, and profit by the experience of other nations. Only in following this course will Americans be able to win that predominance that belongs naturally to them in the South American trade.

The value of the foreign goods imported through the port of Paranagua in the years named was:

	Gold.
1891	\$200, 755
1892	
1893	<i>2</i> 04, 008

The above figures, given by the custom-house of Paranagua, must be certainly erroneous, one firm alone importing over 1,000,000 milreis

of goods annually.

In the first nine months of 1896, the shipping of the same port was 355 vessels, of 182,314 tons, which would make, for the year, at the same rate, 475 vessels of 243,000 tons.

### INDUSTRIES.

The manufacturing industries are yet in their infancy. Only the capital of the State, Curitiba, which boasts of possessing over 20 matte mills, about 10 breweries, and several other industrial establishments driven by steam, may be able to claim some prominence in this branch of activity.

The following table refers to the year 1896:

List of commercial and industrial firms in the city of Curitiba.

Industry.	Number.	Industry.	Number.
Dry goods, hardware, and groceries	236		
Shoes	4	Attorneys at law	1 :

Digitized by

Eight miles from Curitiba there are over 20 limekilns, which supply the capital with this important building material. In the suburbs of the same town, about 24 potteries are in activity.

#### COMMUNICATION.

The Compagnie Générale des Chemins de fer Brésiliens, which owns all the railroads of this State, has the following lines in operation:

	Miles.
From Paranagua to Curitiba	68.9
From Curitiba to Ponta Grassa	118.6
From Morretes to Antonina	11.5
From Restinga Secca to Ponta Amazonas	6. 2
From Capivary to Rio Negro	45.9

The surveys for the construction of a railroad line from Curitiba to Serro Azul have already been concluded by the same company, and the

preliminary works are expected to begin soon.

The construction of a line destined to connect the States of São Paulo and Rio Grande through Parana, has already been initiated by the São Paulo and Rio Grande Railway Company. Thus far, the two following sections are open: From Ponta Grassa to Castro, 37.2 miles; Ponta Grassa to Traty, 68.3 miles.

A concession has further been granted for the construction of a road to Matto-Grosso, through the valley of the Trahy, but, owing to the lack of the necessary capital, nothing has yet been done in this direction.

There are in the State 780 kilometers (484.6 miles) of macadamized roads.

The total extension of telegraphic lines in Parana is 981 kilometers (609.5 miles), with 15 stations.

# FIELD FOR AMERICAN CAPITAL.

A glance at the map of southern Brazil will show that the coast, which from Cape Frio follows a westerly direction, begins from the Bay of Paranagua to take a southern course. At the bottom of the convexity lie the cities of Paranagua and Antonina. Both places are already in railroad communication, through Curitiba, with Ponta Grassa, 300 kilometers (186.4 miles) from the coast. If, from this place, the road would be prolonged as far as Jatahy, on the Tibagi river, 400 kilometers (248.5 miles) away, the whole of the navigable system of the

Upper Parana would be opened to the trading world.

A company with adequate capital could easily get the concession for building such a route, and put on the navigable parts of the rivers five or six steamers for trading purposes. Instead of asking for its enterprise a State guaranty of 7 per cent, it could obtain vast concessions of land on each side of the road and of the rivers explored. It could further organize, through agents in Europe, the United States, and other parts, the immigration of numerous colonists to settle on its lands on fair terms. Again, it could exploit the natural products of the region, work mines through other concessions, cultivate coffee, cotton, tobacco, vine, sugar cane, indigo, cocoa tree, etc., and begin many other enterprises.

This brief summary will suffice to show what could be done here

with capital and energy.

### TRADE IN PARANA.

Consul-General Seeger writes from Rio de Janeiro February 11, 1899: The conditions of trade in the State of Parana are in the main identical with those of other Brazilian States, more particularly with those of Sao Paulo, whose imports and exports are almost exclusively made through the port of Santos, and which has as distributing center for the whole State the city of Sao Paulo. Like its neighboring State, whose topographical features offer such a similarity to its own, Parana receives all its imported goods through one seaport, Paranagua, sending likewise its exports through the same port (Antonina, as a place of export, being but a dependency of Paranagua). Curitiba, the capital of the State, acts as its distributing center. As Sao Paulo is located on the table land just behind the Serra do Mar and connected with Santos (80 kilometers away) by railroad, so is Curitiba connected with Paranagua by a road of 111 kilometers, its topographical situation being the same.

The railroad system of Parana, which to-day reaches as far as Castro (250 kilometers from Curitiba) on one side, branching off to the Rio Negro toward the State of Santa Catharina on the other, will in its further development follow the course of the large rivers (Tibagy, Paranapanema, Ivahy, Tiquira, and Iguassu) which flow toward the Parana. It is, then, more than natural that every material progress realized in the State will be to the direct benefit of Curitiba, controlling,

as it does, the only way to the sea.

The trade of Curitiba is largely in the hands of Germans, and it can be said that of the total imports, three-fifths come from Germany, one-fifth from England, and one-fifth from other parts. Different factors contribute to the predominance of German trade: (1) Their natural trading gifts, (2) the large German colony of Curitiba, (3) German activity and initiative, (4) the direct communication afforded with Germany through the bimonthly service between Hamburg and Paranagua, by steamers of the A. C. Freitas & Co. and the Hamburg-South American Line, and (5) the great number of commercial agents visiting the State with large assortments of goods.

There came, for instance, in the last three months, five such agents, representing large German manufacturing concerns, and every one of them made satisfactory sales. On the other hand, this market seems to be entirely forgotten by American, English, or French manufac-

turers.

There is a marked difference in the trading methods of local Brazilian and German firms. While Germans receive most of the imported goods directly from the manufacturers at home, Brazilians content themselves (with a few exceptions) with giving their orders to importing firms of Rio. As a rule, it can be said that German firms have always on hand a larger and better assortment of all kinds of goods (dry goods and hardware), and sell, generally, at low prices, while their Brazilian competitors confine their activity to the sale of articles of luxury, dry goods, and specialties. The result is that the Germans have the largest patronage, while Brazilian stores are frequented by but few customers.

The trade with the small towns and settlements of the interior presents different characteristics, which it is well to note. Maté being about the only article of export of the State, plays an important rôle as a medium of exchange. The small traders who supply themselves with goods from the capital, furnish these to the colonists for remittances of maté, which they then send to Curitiba in payment of their dues. More than half of the business is done in this way.

Payments are generally made on very easy terms, credits of six to

nine months being nothing uncommon.

Efforts have been made to export different products of this State—hides, wax, hair, honey, etc.—owing to the low rate of exchange. The results thus far have been the following: The firm, Burmester, Thon & Co., exported 6,700 hides, to which can be added about 300 more shipped by another firm, giving a total of about 7,000 hides; the first firm has also sent to Europe about 9,000 kilos of wax, out of a total of nearly 15,000 kilos. Of the other articles, the quantity handled has been so small that it is not worth mentioning.

The constant fluctuations in exchange make trading in these goods

uncertain and hazardous.

The possibilities of American trade with Brazil are great, but in order to reach its natural development, methods different from those hitherto followed must be adopted. Of these, the principal are the following:

First. The establishment of a North American bank in Rio, with

branches in all larger cities.

Second. The organization of several lines of navigation, to call regularly at the different Brazilian ports, with freight tariffs permitting them to enter into competition with foreign companies, that is to say, expenses to transport American goods to Brazil should not be higher than those to which English and German goods are subjected.

Third. The location in all commercial centers of Brazil of American

firms dealing in American goods.

Moreover, United States manufacturers must make up their minds to send to this country traveling salesmen carrying large assortments of all manufactures, with liberty to deal with possible customers as the conditions of each particular case may require. These salesmen must not only be thoroughly acquainted with the conditions of Brazilian trade, but they should know the Portuguese language. A knowledge of German is also very important, principally in the three southern States (Parana, Santa Catharina, and Rio Grande do Sul), where the trade is principally in the hands of Germans.

Among United States firms showing commendable energy may be named the Singer Manufacturing Company. Besides establishing a branch house in Rio, whose manager keeps in touch with all important centers of the country, they constantly send illustrated circulars to all firms whose names they can get. A few weeks ago, one of the German firms of this place asked for circulars printed in the German language,

and they at once sent a number of them here.

I have seen, personally, a number of American articles imported from Germany. Why should the trader be obliged to go to Germany in order to obtain goods manufactured in the United States? American goods can be sold largely in Brazil, being in quality and price equal to any others. But if American manufacturers wish to open trade, they must enter into direct relations with this country and keep themselves always in touch with their customers.

### TRADE IN SAO PAULO.

Under date of February 18, 1899, Consul-General Seeger adds:
I have avoided in the following a reiteration of such facts and figures as are given in the very elaborate report of Consul Frank D. Hill, of Santos, published in Commercial Relations, 1896-97, or those supplied by Vice-Consul Haugwitz.\*

<sup>\*</sup> See advance sheets of Consular Reports No. 398, April 12, 1899.

The economic and consequently the political and social conditions of the State of São Paulo have been undergoing a very marked change during the last ten years, commencing with the abolition of slavery, and intensified three years ago by the unexpected and very material decline in the price of coffee, heretofore the exclusive product of that

great and prolific State.

From 1887 until January, 1896, the coffee prices varied from 13½ to 18¾ cents, gold, per pound. Then the following rapid decline took place: July 1, 1896, 13 cents; January 1, 1897, 10½ cents, and April 1, 1897, 7½ cents. The prices for the harvest of 1897–98 varied from 5¾ to 7 cents, and the quotation on February 1, 1899, was 6¾ cents, gold, per pound. Much of the reduction of price, however, was offset by the increased yield of the harvest.

The new era has brought healthier conditions than those that prevailed before, although it may be characterized by the motto which Tom Paine applied to the period of a man's life after 40: "Hope less

and work harder."

Until very recently, the rich, arable lands of the State of São Paulo were owned by a comparatively small number of men, who converted them into immense coffee plantations, some of them containing from 200,000 to 1,000,000 trees, which yielded almost fabulous profits. Conditions apparently extremely propitious soon degenerated. The immense riches, gained almost without exertion and without risk, caused luxurious living. The great profits earned on Brazilian soil were mostly spent abroad, in Paris. While the State had comparatively little benefit from the profits reaped from its soil, the rising generation, by living abroad, became denationalized, and their sympathies, habits, and tastes were foreign. Meanwhile, the slaves and tenants here indulged in a haphazard cultivation of the soil, only half realizing the benefits which would have resulted from more rational and intelligent systems. Of course, large capitals or large credits were required to maintain such large plantations, and as none of the original owners or their descendants were willing to dispose of part of their immense holdings, tenants or farmers of small means could not aspire to become possessors of the soil they tilled. Landlordism in a very objectionable form prevailed in the great coffee States, impeding their sound economic and ethical development.

Conditions have now changed for the better, and the strong decline in the price of coffee will prove, on the whole, a blessing in disguise. Great numbers of citizens of the State have been compelled to return from abroad to take personal care of their property, and to work. Their children will be identified with the industrial and political future

of their country.

The reduced profits will necessitate a more energetic, prudent, and rational administration of the fazendas. The fruit-bearing trees will receive the attention to which they are entitled. The gathering of the crops will be conducted with a great deal more care than heretofore. Retorms will be inaugurated in the cleaning, drying, handling, and sacking of the product of the harvest. I have been credibly informed that the productiveness of many of the fazendas may be increased in this manner more than 25 per cent, and the value of the marketable coffee to a corresponding extent.

Another fortunate feature of the new era is the fact that many of the fazendas have been either sold in their entirety to English, German, and Belgian stock companies, with ample means for a rational and modern cultivation, or divided into small sections and sold to farmers of limited means. These people make the most of their moderate

means and endeavor as a rule to raise enough by-products (cattle, hogs, cereals, beans, mandioca, sugar, fruit, and the like) to afford them a comfortable living, so that the greater part of their coffee harvests constitutes an accumulated capital. A small farmer and his family can easily take care of from 8,000 to 12,000 trees, and figuring the annual product of a tree in São Paulo at  $3\frac{1}{4}$  pounds, his profits are obvious. His expenses in maintaining a coffee farm will be relatively much less than those of the large fazendeiro. In other words, coffee culture on a 30-acre farm is relatively more profitable than on a 1,000-acre farm.

Recently it has been asserted—of course, not always by disinterested parties—that coffee planting has ceased to be a lucrative occupation, and that consequently, a great many fazendas would be abolished till the production would be diminished to a degree more in proportion to the demand, and thus a gradual increase of coffee prices would be

effected.

After a careful study of this matter, my impression is that the premises of such assertions are entirely erroneous. While I take it for granted that the coffee prices in the near future will not be any higher than they are at present, I have no hesitation in saying that despite these facts, coffee culture will continue to be, at least so far as the great coffee State of Sao Paulo is concerned, a very lucrative business, a great deal more so than wheat raising or corn planting in the United States. Although it is not probable that the Brazilian coffee planter will ever again receive from invested capital a yearly income of over 100 per cent, it is nevertheless a fact that there can hardly be found an agricultural venture anywhere which will yield so large a profit with comparatively little risk or labor, as a well-managed coffee plantation in the State of Sao Paulo, even at the prices now prevailing.

In this connection, I ought to call attention to the fact that the State of Sao Paulo has much more favorable conditions for coffee culture than any other coffee growing district known, the rich soil in the west being eminently adapted to it. Experts have told me that no recourse to artificial fertilization is necessary, and that the State of Sao Paulo alone could easily supply all the coffee required for the consumption of the world. Few people know how much of it this State supplies already. Brazil now furnishes two-thirds of the coffee consumed in the world, and Sao Paulo furnishes more than two-thirds of the product of Brazil. The assertion so frequently circulated of late, that coffee culture in Brazil is on the decline, is misleading so far as the State of Sao Paulo is concerned. The Rio district, where on the whole the soil is poorer and the climate less favorable to coffee culture, where the trees bear less and do not last so long, may be considered as declining, although this year's harvest is estimated at not less than last year's, namely, about 3,000,000 bags.

But in Sao Paulo, coffee culture is actually on the increase. In the eyes of most dealers and speculators in coffee, it is almost a crime to say that the next harvest will be favorable, and many interested parties have caused reports to be circulated that, owing to the exhaustion of the old trees, which bore such an abundant harvest last year, and owing to various climatic causes, the next crop (1898-99) will be a great deal less than that of last year. These annual statements of the prospective result of the coffee crop are very similar to the proverbial prognostications in regard to the Delaware peach crop, which has suffered by frost as long as I can remember.

The probable shortage of the yield of the old trees will be more than counterbalanced by the new plantations now commencing to bear. I am informed by competent and absolutely disinterested parties that

Digitized by GOOGLE

the Sao Paulo coffee crop of 1889-99 will be the largest ever harvested in that State, and that it will likely surpass 6,000,000 bags, which, by the way, will bring the result of the Brazilian coffee crop to about 10,000,000 bags. The estimate is as follows:

Santos district, Sao Paulo, southern Minas, and a small part of Rio, at least. Rio district	3, 000, 000
Total	10 000 000

The bags contain 60 kilos, or 132 pounds.

Dr. Horace M. Lane, president of the well-known Mackenzie College at Sao Paulo, says in the Brazilian Bulletin:

It is a grave mistake on the part of the Brazilian coffee merchant to attempt to minimize the output of coffee for the purpose of putting up the price. The enormous producing capacity can not be concealed. Climate, soil, immunity from disease, and abundant labor conspire to make Brazil the great coffee-producing country of the world. The better policy would be to stimulate production and promote consumption.

Since the abolition of slavery the gradual substitution of white (Italian) labor and the consequent change in the system of planting, the coffee production of the State of Sao Paulo has rapidly increased, as is shown by the following figures:

1 200	000
1,000	, 000
4. 326	.000
5. 919.	. 000
ə, əzi,	, ww
e non	000
0,000	, ww
	1, 800, 4, 326, 5, 919, 5, 521, 6, 000,

The Santos zone (Sao Paulo, southern Minas, and a small part of northern Rio) comprises about 500,000,000 coffee trees. The trees bear, according to variety and soil, when from 3 to 5 years old. The "Bourbon" variety, which was recently introduced into Brazil, yields on the rich soil of western Sao Paulo a good crop in the third year, "Java" in the fourth, and "Native" in the fifth year. In the rich "terra roxa" of Sao Paulo, a coffee tree, when rationally treated, will bear from twenty to thirty years and longer.

The average yield of a coffee tree in Sao Paulo is 3½ pounds; in favorable years, a great deal more. In other coffee districts—Mexico, Java,

Arabia—the yield is only a little over 1 pound per tree.

Nothing can be more erroneous than the impression prevailing abroad that the Brazilian coffee is of an inferior quality and unpalatable. In all my extensive travels through Europe and America, I have never found a better coffee than the one served in the many restaurants and

coffeehouses here, at the price of 1 cent per cup.

The Brazilian planters have spared no means to get the best varieties of coffee trees from every place where famous kinds exist, and the cultivation receives more and more attention. But they suffer from the fact that in the markets of Europe, as well as of the United States, their fine product is sold under misleading names—"Mocha," "Old Government Java," "Guatemala," "Porto Rico," etc.—while everything that is bad or damaged in the coffee market is sold under the name of "Santos" or "Rio." It is regrettable that measures can not be adopted against practices of this kind, so hurtful to a very large class of producers.

In Europe, as well as in the United States, lovers of a cup of coffee generally order "Mocha" or "Mocha and Java mixed." No writer of fiction would allow his heroine to sip "Santos" or "Rio." It is always "Mocha."

They do not seem to know that there is not enough "Mocha" grown to supply New York or Chicago with coffee for a week. Once in a while, a shipload of coffee is sent by an enterprising dealer from Santos to Aden, the seaport of the Mocha district, whence the cargo is reshipped to Europe. Whether this is done to improve the quality of the coffee or to keep up the Mocha illusion, I do not know.

The conditions of commerce and trade in Saō Paulo are far from being satisfactory at present. The want of ready cash is felt everywhere, and interests and discounts are extremely high—1 to 1½ per cent per month on good paper.

How much the import trade of the United States is at a disadvantage in European competition is shown by the following figures, cover-

ing the period of 1896, the last figures available:

	Imports.	Exports.
Total value   Smilreis   dollars	20 1	280, 000, 000 a 50, 400, 000 2 25 15

a Taking the exchange value of the milreis in 1896 at 18 cents United States currency.

The export consists exclusively of coffee, upon which the State levies

an export duty of 11 per cent.

The import trade of the United States with Sao Paulo is susceptible of great development, if rationally and energetically pushed, and if our manufacturers succeed in obtaining cheaper freights. In regard to transportation facilities and freight rates, the United States is at a decided disadvantage in the ports of Bio and Santos.

Some of the rates charged for goods from the United States by Eng-

lish steamers are almost prohibitory.

Dr. Lane, the president of the Mackenzie College in Sao Paulo, who has resided in Brazil since 1855, told me that in 1894, he imported from New York, on a Lamport & Holt steamer, school furniture valued at \$4,000, and had to pay \$2,300 freight on it. For a New Jersey cow imported from the United States, he had to pay \$100 freight, (twice as much as a steerage passenger pays), while cattle from the river Plate to England cost at that time \$15 a head.

A member of the Lidgerwood Manufacturing Company informs me he was lately prevented by high freights and the lack of shipping facilities in New York to avail himself of otherwise very advantageous offers of cast iron and steel from the United States. From dealers in American machinery, I hear similar complaints. For the following articles, among others, American exporters might find a lucrative market in Sao Paulo: Agricultural implements, bicycles, carriages and carts (dump carts and sewage carts), coal, clocks, crystal, cutlery, electric appliances, flour, furniture, glassware, kerosene, lamps, all sorts of machinery, condensed milk, paper, optical goods, plated ware, preserves, rubber goods, shoe ware, surgical instruments, watches, willow ware, and wooden ware.

In the manufacture of furniture for export to Brazil, no glue should be used, but only nails and screws, as glued furniture will not withstand the combined influence of heat and moisture prevailing here. Vehicles, for the same reason, and also on account of the bad roads, must be built much heavier, the tires to be  $1\frac{1}{4}$  to  $1\frac{3}{4}$  inches larger than those in use in the United States.

Collins's axes and Ames's shovels, great favorites all over Brazil, have lately suffered through cheap and worthless imitations (even of the package and the labels) from Belgium and Germany.

The following is a list of the Sao Paulo merchants handling American goods:

Hardware.—Zeremmer, Bülow & Co., Lidgerwood Manufacturing Company, Hasenclever & Co., Companhia Lupton, Lion & Co., Rickser, Brenner & Co., Compania Mechanica e Importadora, A. Trommelt & Co., Karl Valais & Co., King, Ferreira & Co.

Cotton goods.—D. Heydenreich & Co.

Paper.—Van Orden & Co., C. F. Hammett & Co., Camillo S. Rodriguez & Co., E. Sigueira & Co.

Provisions.—Herman Stoltz & Co., Francisco Muller & Co. Spirits.—José Weissohn & Co., Camillo S. Rodriguez & Co. Drugs.—Barnelt & Co.

The Santos coffee exporters are: Naumann Gepp & Co., Theo. Wille & Co., Goet Hayn & Co., E. Johnston & Co., Zerenner, Bülow & Co., A. Trommel & Co., J. W. Doane & Co., Julian Haugwitz, Hard, Rand & Co., Henry Waltzer & Co., Nossack & Co., Lewis Brothers., W. F. McLaughlin & Co., Arbuckle Bros., Aretz & Co., Krische & Co.

Americans in search of information of a scientific character concerning Brazil, and especially Sao Paulo, will do well to preserve the addresses of the following noted scientists:

Senhor Prof. Orvillo A. Derby, chefe da commissaô geographica and geologia, Sao Paulo; Senhor Dr. Horace M. Lane, president Mackenzie College, Caixa 14, Sao Paulo.

In revising the above, I find that I have omitted to mention a very characteristic fact, namely, that of the 839 steamships which during the last year entered Santos, the only port of the State of Saō Paulo, not one sailed under the American flag.

## ANNUAL REPORT OF BRAZILIAN MINISTER OF FINANCE.

Consul-General Seeger also sends the following, under date of July 25, 1898:

Owing to the financial crisis in Brazil, the annual report of the Brazilian minister of finance was awaited this year with more than ordinary interest.

It is a summary of the accidents and difficulties which have hampered and jeopardized the financial progress of the Brazilian Republic. The minister is exceedingly frank in his exposition of the causes which nearly reduced Brazil to a suspension of its payments, and did force it to seek an extension of time from its creditors. An abstract of this report, with some comments in explanation of points which are not readily understood abroad, will be read with interest in the United States by those who are endeavoring to extend our foreign commerce.

The minister states that the climax of the financial difficulties was reached in 1897 and during the first half of the current year, and

among a number of causes, enumerates the following:

Reduced production and excessive imports; disturbances, political and military; the serious decline in the price of coffee; defects in the system of taxation, the revenue being almost exclusively contributed by the custom-houses; want of confidence on the part of foreigners resident or having material interests in Brazil, producing a steady flow of money out of the country; remittances to foreign countries by alien artisans and laborers employed here, and to nonresidents of rents, interest, and dividends on investments in Brazil; budgets badly organized, by which insufficient appropriations were made, and in consequence of which extraordinary credits had to be opened; international misunderstandings; variations in the rates of foreign exchange, and consequent speculation; the absence of order and discipline, which has led to rioting, and culminated in the attempt on the life of President on November 5, 1897, and the murder of the secretary of war; speculation abroad in the securities of the country.

This is a sufficiently long list of causes for the condition of the Brazilian treasury, but in proceeding with the report the minister virtually concentrates his attention upon three of the above-cited points, which are: Exchange differences, budget deficits, and depreciation of the currency. He submits to the President of the Republic various ideas and plans which he thinks would materially improve the conditions

now almost unbearable to the nation.

To understand the conditions which give rise to the exchange differences in Brazil, it will be necessary to explain that the country's revenue is collected exclusively in paper money, while such of its obligations as interest on its foreign debt and interest guaranties to railway and other corporations whose capital is furnished by foreigners are payable in gold; the expenses of its diplomatic corps and its entire civil and military establishment abroad must be met by the purchase of foreign money in the home markets. In other words, the Brazilian Treasury is in direct competition for rates of foreign exchange with commercial debtors to foreign markets, and these rates of exchange are themselves regulated by the produce exported from the Republic. It has, therefore, been the practice in organizing the annual budgets, to appropriate a sum to meet any difference between the appropriations made for payments in gold and the cost of these sums in paper money. This is what the minister means by his repeated references to "exchange differences," and which he states advanced from 10,000,000 milreis (\$1,500,000) a few years ago to 110,000,000 milrois (\$16,500,000) in the last budget; and even this large amount was not sufficient to meet the difference between the real cost, in paper, of the Government's remittances abroad and the amount as appropriated in the budget.

Upon this question of "exchange differences" a large portion of the report naturally centers, for this great expense has of late years been

a constart drain on the treasury.

The report discusses the serious decline in the value of Brazil's principal export, coffee, its effect upon the value of exchange, and specula-

tive tendencies resulting therefrom.

Foreign exchange is conducted in Brazil principally through the agency of five banks, three British, one French, and one German, which have a practical monopoly of the business, and the policy of these institutions has been to furnish no drafts on foreign markets unless they had "cover," or bills against produce. The current rates of

exchange are naturally affected by the transient supply of or demand for foreign money, leading speculators to buy or sell what they can not pay for or do not possess in anticipation of a rise or fall in exchange, as the case may be. This affected the treasury also as a competitor in the same market, and the minister comments upon the practice in somewhat harsh terms.

For many years, the exchange rates here were artificially sustained by the simple process of borrowing money abroad, which relieved the Government of all necessity of entering the local markets to secure remittances, or at least reduced this necessity to such a degree that it but slightly affected the balance of trade, and made Brazil a prosperous country. But on account of grave errors committed by the first financial ministers after the Republic was declared, it was no longer possible to continue the former system, and when the demand for Government remittances was added to that for commercial purposes, it soon became evident that the exports of the country were not sufficient to meet these combined demands. The value of the currency depreciated more and more until 1895, when the treasury raised a loan in London of a nominal value of £7,300,000, producing £6,000,000 net, after having negotiated a loan for £3,600,000 for the Western Minas Railway, the interest on which is guaranteed by the Brazilian Government, and the proceeds of which were to be paid over to the company here in currency. These transactions seem to have partially met the obligations of the Government abroad, though the minister states that in January, 1897, an additional loan of £1,000,000 was obtained from the French bank here, which was repaid in the following November by a loan of £2,000,000 in exchequer bills raised in London. According to the minister's report, the foreign funded debt has been increased from £30,283,200 in 1889 to £38,006,400 at the present time.

The above will at least partially explain the manner in which the so-called "differences in exchange" have so enormously increased, until the country's foreign indebtedness threatened to absorb the whole of

its revenue.

At the beginning of the present year, speculation, ever on the alert, assumed that bankruptcy threatened the country, and a campaign was commenced that depressed exchange rates almost steadily until the value of the paper milreis on May 14 was no more than 5\(\frac{1}{3}\)d. sterling, or about 11\(\frac{1}{4}\) cents gold. The commercial body became alarmed, and a general suspension of payments was threatened, when about one week later, negotiations were set on foot in London for the relief of the treasury, and the gold value of the milreis advanced rapidly, ruining the greater part of the speculators. Since the middle of May, there have been other changes in the value of the currency, but as a rule the fluctuations have not been serious and of little importance to legitimate trade.

Budget differences are, unfortunately, frequent in the financial history of Brazil. Either the appropriations voted have been insufficient or the ministers have underestimated the necessities of various services. Whatever the cause, the result has invariably been a very substantial

expenditure in excess of the amount appropriated.

The depreciation of the currency is a subject upon which the minister publishes a contribution from an expert. He submits that from a circulation of about 211,000,000 milreis in 1889, the currency had increased to about 712,000,000 milreis in 1896. This vast amount, it must be remembered, is irredeemable paper or "token money," of no intrinsic value, and only used as a convenient means of barter, and its value is

regulated like that of any other commodity, by the laws of demand and supply. Thus, if an exporter of produce wishes to buy gold—i. e., exchange his paper currency for gold—the amount he can obtain will depend upon the relative abundance of each kind of money; the greater the quantity of irredeemable paper in circulation, the less will be its value, and the more it will require to purchase a unit of gold. So the Brazilian importer who must satisfy his foreign creditor is often compelled to pay several times the actual amount of his debt, owing to the enormous quantity and paltry value of the paper milreis. The minister seems to think that a withdrawal of a part at least of the currency is absolutely indispensable, but hesitates to effect this by means of a loan.

The minister prints the following summary of the movement in 1897, which he considers a fair exponent of preceding years:

Value of exports, excluding specie and exchange drafts, the value of	
the milreis being calculated at 7% d. (15.6 cents)	£26, 752, 224
Value of imports, at same calculation	21, 567, 660

This was in favor of Brazil; but Government remittances, and those of individuals for rents, revenue, and savings, were estimated at £9,644,614, leaving a balance of trade against the country of £4,460,050.

These figures demonstrate either that the importation must perceptibly decrease, or, as the minister hopes, exports must increase. I incline to the belief that the former is the more probable, although an increase in the price of coffee abroad would materially influence the figures.

The minister of finance proposes the following means to extinguish exchange differences, balance the budgets, and improve the value of

the currency:

First, he advises the creation of a fund abroad by the alienation of public properties, or an extension of credit, by which the treasury will be relieved of all necessity of purchasing exchange in the local markets, and by the conversion of the internal debt, bearing interest payable in gold, into one whose interest is payable in currency. This he has succeeded in doing to a very considerable extent by arranging with the foreign creditors, to have them receive their interest for three years in funding bonds, and the Messrs. Rothschild published a prospectus in London on June 15 last to this effect; and it is further proposed to convert about 124,000,000 milreis of Government stock, which was earning 4 per cent per annum in gold, into about 155,000,000 milreis of Government stock earning 5 per cent currency—a most substantial economy, for unless exchange touches 17½d. (\$0.353) per milreis, there will be a gain for the Government; at present, the milreis is valued at about 7¼d. (\$0.146).

To balance the budgets, the minister proposes to collect import duties in gold. As at present organized, the customs tariffs are specific, but are based upon an ad valorem collection in which the milreis is estimated at 12d. sterling (24 cents). The minister argues that as cost, freight, and foreign charges are payable in gold, there is no hardship in collecting duties in the same specie. He points out that the payment of duties in gold, by keeping the treasury out of the local exchange markets, must tend to improve the value of the currency. At the same time, the minister advocates an increase in direct taxation, which would partly serve to relieve the custom-houses of their present duty of collecting the greater part of the revenue of the country. Internal revenue is already col-

lected on tobacco, matches, salt, effervescent waters, and beer, but the minister considers an income tax necessary, although this was rejected by the Congress in its last session, and is likely to meet with great opposition if it is again proposed.

To enhance the value of the currency, it is proposed to apply funds to the gradual withdrawal of paper. This would certainly improve its value by creating a relative scarcity, but the scheme has many

opponents.

To summarize, I may say that the actual financial position of Brazil is far from serious. After the vicissitudes through which Brazil has passed, a period of quiet and recuperation is necessary; and if an earnest attempt is made to retrench, as the incoming government is virtually pledged to do; if the great resources of the country are adequately developed, the revenues equitably collected, and the import trade accommodated strictly to the legitimate demand, there is no reason why Brazil should not emerge from its present crisis stronger than before.

### PARA.

There is a broad and steady expansion of trade throughout the States of Para and the Amazonas. The State of Para, or, more correctly, "Gram" or "Gão-Para," takes its name from its chief town. The founders called it "Santa Maria de Belem" (St. Mary of Bethlehem). The town is still called "Belem," although Para is the more general name. When the Portuguese sought to give it a name based on a local characteristic, they found from the natives that the principal river, near which the city is located, was known as "Parana-Assu," meaning Great River. They took this to be the native name for the Amazon, but subsequently found that the Tocantins was meant.

The Para River is connected with the Amazon by a labyrinth of narrow channels. The city of Para, situated only about 100 miles from the mouth of the Amazon River, is the key to an enormous stretch of wealthy country, and indications are that it will become the Chicago of South America. It is quite true that Manaos is growing by rap'd bounds, but she has a long distance to travel before she can overcome

the lead Para has secured.

The population of the State of Para, according to the census of 1896, amounted, I believe, to 577,000 inhabitants. The city of Para is roughly estimated to have nearly 150,000. The last census also showed that the State contained 9 towns with populations of over 10,000, and 65 with populations varying from 1,000 to 9,000. The State receives its taxes in currency, and is not affected by exchange, as it has no external debt.

Over 150 steamers are employed on the Amazon and its tributaries (about one-third of these vessels belonging to a British company), and the number will be increased materially before the end of the year. These vessels numbered only 105 three years ago. Large boats go up the river as far as Iquitos, nearly 3,000 miles. The internal communication afforded by the Amazon and its branches is so complete that railroad and terrestrial means of transportation are not needed, except to connect parts of rivers obstructed by rapids. Commerce at Para has developed enormously within the past few years; the custom-house is overwhelmed with work, and there are not at present enough stores to receive the goods as they arrive, although large additions have recently been made. The result is that merchandise is generally kept in

lighters several days and even weeks, before it can be received in the custom-house. This state of affairs causes inconvenience, and exposes merchandise to deterioration. It is not, however, due to inefficiency on the part of the custom house officials. On the contrary, the officers in charge accomplish a great deal when the small force is taken into consideration.

Both lines of steamships running between Para and New York are increasing the number of their ships, as they are entirely unable to carry the heavy freight billed for this section of the country. A short time ago, the two lines made one trip each a month; later, a bimonthly service was established; now three trips are made, and I am reliably informed that on the 1st of next January, weekly trips will be made. No better evidence could be brought to show the greatly increased demand for United States goods. I learn from the captain of every vessel coming from New York that it is utterly impossible for any one of the steamers leaving that port to clear the freight billed for Para and the Amazon. This statement is gratifying in the extreme, though it is to be regretted that these goods can not be hauled in American ships.

In the absence of printed statistics, it will be impossible to furnish an absolutely correct list of imports. American trade with Brazil, however, has increased tremendously of late years, and the broad expansion

in demand can not be regarded as other than encouraging.

The majority of merchants here require from ninety to one hundred and fifty days' credit; some, of course, only ask for half of such time. Germans stand ready to meet all requirements and competition. Our salesmen must expect to encounter sharp competition. A study of conditions is absolutely necessary.

### FLOUR AND FOOD PRODUCTS.

We furnish all the flour to this community, and, I am proud to say, there is no room for improvement in this particular article. We also supply the bulk of the hams, bacon, lard, and other articles belonging to this class.

# BOOTS AND SHOES.

United States boots and shoes are recently securing quite a foothold-German-American agents have just received upward of 9,000 pairs, and one advises me that the attractive finish and superior workmanship enabled him to dispose of all of his consignment, which he had had made especially for this market by a Boston house. This same gentleman has gone to Boston to lay in a much larger line of shoes. He intends to open an American shoe house, confining himself entirely to these goods.

# MACHINERY.

There is a broad field for expansion in machinery. This line of industry has made rapid strides in the right direction during the past six months, and would increase much more if our manufacturers would take advantage of this opening. It is my opinion, after a careful canvass, that this trade could be indefinitely increased if a thoroughly competent agent were sent to the spot, one with long experience and practical knowledge, who could explain any article he represented and who knew how to exhibit his goods to advantage. A rich harvest would follow, provided the proper methods are adopted for introducing these articles. Satisfactory results, however, can not be brought about by correspond-

ence; an energetic man must be sent, one who if he fails at the beginning will not become discouraged. It is a common occurrence to receive circular letters from American firms, descriptive of their wares or goods, requesting distribution among the various merchants of this place. In three cases out of four, the circulars are printed in the English language. Everyone who has handled American machinery, of whatsoever nature, praises it in high and unmistakable terms, and if I only had the time they would seemingly never tire of telling me why they prefer it to that of any other country.

### WINES AND LIQUORS.

The recent development in the United States beer industry in this district is unprecedented, so rapid has been the growth of the sale of "Schlitz" and "Anheuser," both American manufactures, within the last nine months. Our gins, whiskies, brandies, etc., are also gaining the market. It appears that American beer is suitable for this climate, being light, and it is unquestionably gaining ground.

A good market can be created here for California wines and Kentucky whiskies and brandies, provided the agent can make prices and terms of credit that will enable him to compete with all comers. Tastes and

prevailing customs must be studied at every turn.

### HARDWARE AND CUTLERY.

There is an excellent opportunity for trade in this line. Every hardware establishment in Para carries some goods manufactured in the United States. Among other articles, I notice the famous Colt's and Winchester repeating rifles, together with many other makes of less reputation. It is to be regretted that, in the absence of statistics, I can not show exactly what proportion of exports each country sends to this corner of the world.

I am convinced that builders' materials could easily be marketed here; also, agricultural implements, such as hoes, shovels, hayforks, spades, hatchets, and axes. Yale locks, hinges, fastenings, and all kinds of cartridges find a ready sale. A general line of household utensils, in my judgment, would quickly get a foothold here, and a number of other articles which belong to this group.

# JEWELRY, WATCHES, SPECTACLES, ETC.

To surrender this rich field to our German competitors, without even a struggle, would be foolish. I have devoted considerable time to this little group of specialties, and I would make the following recommendations:

For spectacles or eyeglasses, I observe that a metal known as "alloy" is rapidly gaining favor; in fact, a majority of the jewelers here advise me that it will be difficult to market any other kind. This has also been verified by a traveling agent who handles eyeglasses exclusively.

I am certain that a market could be created here for a cheap line of clocks. Inexpensive watches would sell readily; say, for instance, one selling for from \$4.50 to \$7 or as high as \$9. Of this class, a steamship load can be sold here and up the Amazon. One would also have no difficulty in disposing of rolled-gold or cheap plated jewelry.

### HIGH-CLASS CONFECTIONERY.

An excellent market can be created here for this class of goods. There is not an establishment in Para dealing in confectionery.

choice line of fancy or mixed candies, together with a general assortment of other articles that are usually carried by similar houses, including, of course, a soda fountain and ice-cream freezer, would probably meet with success.

### SEWING AND TYPEWRITING MACHINES.

I believe that not a sewing machine can be found within the limits of this city, or up the Amazon Valley, except of United States manufacture. I have made a careful canvass, and discovered that almost every tailor and shoemaker in the city of Para, as well as a large majority of private residences, owns a sewing machine manufactured in the United States; and it is safe to say that the entire upper Amazon is amply supplied with American machines. In fact, I have not been able to trace any others.

There are very few typewriting machines in this section of country that are not of American make, and there is a rapidly increasing demand for our machines. This line of goods is slowly but surely finding its way into offices and commercial houses; there is, however, ample room for expansion in this specialty. A rich harvest might be reaped within a very short time, provided a shrewd and experienced agent promptly entered the field. German agents are scattered all over this country, and they are constantly on the lookout for openings of every nature, never allowing a chance to escape. The sooner these goods are placed on the maket, the more satisfactory the results will be.

#### BICYCLES.

The one marked development in this district within the past six months, I hear, has been in the bicycle trade. The United States

machine was brought into notice in the following way:

It appears that for some time past, the adoption of a bicycle by the entire police force has been rapidly gaining favor, and in consequence thereof, a recent special session of the board was called, with a view to putting the question to a test vote. After mature reflection, the officers of said board decided to recommend the adoption of the bicycle. A committee was appointed, consisting of three experts, with instructions to carefully canvass the Para market with a view to securing the most substantial and generally superior wheel for the least money. The committee advised, in the strongest terms, a wheel made in the United States, adding that the latter clearly outclassed any other in the market. The wheels were forthwith adopted. The gratifying result was that the public, appreciating the test, have had their faith in our bicycles greatly increased. The favorable decision of the committee will prove an exceptionally valuable card to American manufacturers in other lines, as well as in this.

The future outlook for this particular industry can not be regarded as other than encouraging.

## DRY GOODS, HOSIERY, AND NOTIONS.

As in other cases, I find it impossible to obtain exact information as to what extent we supply this line of trade; yet I feel confident that we have a fair share. In cotton goods of the coarser and heavier quality, especially in blue, the work of American mills is preferred and has almost wholly supplanted that from the Manchester mills, or from other parts of Europe; and the same is true of spool and machine thread, twine, and cordage. The trade in hosiery is very much

divided, every country in Europe, as well as the United States, having a share. A line of flashy silk handkerchiefs would sell, I believe, faster than anything I could suggest.

## COAL.

The principal importers of coal are the Amazon Steam Navigation Company, A. Bernard & Co., the Para Gas Company, Booth & Co., Silva Volhote and Co., and Companhia Urbana (Electric Light Company). There is but little coal brought here from the United States, and it is my opinion that proper steps are yet to be taken in order to create a demand. The amount of coal in port at present is roughly estimated at more than five times as much as was ever known to be in storage in Para before. The English Government bought unusually large quantities of coal during the late war. Up to this writing, our coal has failed to secure a substantial foothold. I believe exports from the United States could be developed.

### CARRIAGES AND WAGONS.

Very little, if any, progress has been made in this line. Most of the goods are of home make. From the present outlook, I should not think one would meet with much encouragement in attempting to market wagons, carriages, and other vehicles in this corner of the world. The same is true of furniture. All such goods are manufactured here, except the finest grades, which are purchased abroad, either in the United States or in Europe.

### DRUGS, MEDICINES, ETC.

The terms of credit given by European houses are so easy that drug dealers prefer to place orders there. They also claim that the packing is more satisfactory than ours. Freights being cheaper to New York than to Europe, there is no reason why, by adopting the proper methods, our manufacturers should not succeed in getting a substantial foothold here in the distribution of various drugs; for instance, cures for chills and fever, rheumatism, neuralgia, headaches, gout, and other complaints common in the tropical climates. It is positively necessary, however, to personally study the market. It is important to state that during my term of office, notwithstanding many drummers representing American houses have come here, not one could speak the Portuguese language.

### LUMBER AND DOOR SASHES.

In this specialty, the United States has the market. All the material for manufacturing boxes to hold the rubber, nuts, etc., exported, comes from the United States. I hear that a demand has recently arisen for window frames, doors, and a number of articles of this class. Whenever one branch of industry begins to develop, I find, upon investigation, that it is due in almost every instance to energy and perseverance on the part of the representative of such industry.

#### READY-MADE CLOTHING.

There is no such thing as an establishment in Para carrying readymade clothing. Everything of the kind is made to order. It would

seem, however, that such goods could easily find a market. The cheapest line of clothing, together with calicoes, domestics, and fancy goods, should be sent.

## MUSICAL INSTRUMENTS.

There is an unusually active demand in Para for musical instruments, including both those for house and street music; and there seems to me to be a golden opportunity here for some competent salesman.

#### ASPHALT PAVEMENT.

This pavement is rapidly growing in favor here, and I feel positive that this industry can easily be developed. I have studied the prospects and had interviews with those who are in a position to know, and I believe that a most highly satisfactory harvest will attend effort in this particular branch. A considerable amount of this work has already been done, but the bulk remains to be completed by contract.

### MISCELLANEOUS.

Iron fittings and oil and distemper paints are much in use for houses, and, as every house has a long glass corridor, common glass for windowpanes is in good demand. Tarpaulins and waterproof canvas can easily be marketed here, on account of the rainy climate. The ordinary waterproof can surely get a foothold, provided effort is made to introduce it in this market. Coal, machine oil, paint, rope, and twine are in demand for the largely increasing number of steamers plying up and down the Amazon and its tributaries. I observe numerous articles of United States manufacture in this market, but so distributed as to render it impossible to even approximate to what extent our goods have been introduced. Among other things, I see scales, balances, hatchets, axes, knives, oils, paints, varnishes, nails, files, and sailcloth (blue drill) from the United States. The fast-growing requirements leave ample room for improvement in the export of various lines.

Europeans furnish this market with a considerable quantity of canned provisions, but I am sure that the United States has a fair share.

When the fast-growing requirements of this flourishing district are considered, and the fact that there are no signs of any important resource becoming exhausted for a century to come, my recommendations may not seem too strong.

#### NATURAL RESOURCES.

The chief natural products of this State consist of rubber, cocoa, and nuts. The wealth of the State and the city are founded on the first article; the other two, while important, not sufficing to take the place of the important industry of rubber. Rice of excellent quality used to be grown and exported from here, but of late years has been sadly neglected. The mass of laborers subsist on manioc (or mandioca), salt fish from the Amazon, and jerked beef from Uruguayand southern Brazil. The upper classes live almost entirely on imported food. The island of Marajo contains cattle, but not sufficient for the demand here, and in consequence, large ship loads of cattle come this way monthly from the Argentine Republic. Flour, bacon, preserved fruits and food, biscuit, ham, and a general line of provisions come from the United States. Fresh vegetables, codfish, and many articles come from Portugal. Per-

nambuco supplies sugar. Cane grows well in this State, but is only cultivated for the distillation of rum for local consumption.

France always consumes the bulk of the cocoa produced; during the year under consideration, her share was something near 3,500 tons, the United States and Great Britain dividing the remaining 500 tons.

Nuts.—The center of production of nuts is along the banks of the river Tocantins. In fact, the States of Para and Amazonas produce all the Brazil nuts exported. The amounts and distribution are contained in the following table, which has been obtained from a reliable source:

Year.	United States.	Europe.	Total.
	Hectoliters.	Hectoliters. 51, 191	Hectoliters.
897 896	PTO 000	66, 912	139, 995
895		35, 269 104, 591	96, 731 216, 42
	44, 370	37, 086	81, 45
892	1	42, 741 123, 736	104, 91 243, 08
890		21,718	38, 57
889	35, 855	31, 936 69, 945	67, 79 161, 30
.888		44, 628	101, 92

NOTE.—One hectoliter is equal to 23 bushels.

Lagos, Kongo, and East Africa.

I find it impossible to obtain accurate figures for the six months ended June 30, 1898. It is the opinion of those who are in a position to receive the latest and most reliable information, that about 85,000 hectoliters were received at this port within the first six months of this year, which amount was about equally divided between the United States and Europe.

Woods.—The vegetable kingdom is well represented; the plants furnish gums, resins, nuts, oils, spices, dyes, building and cabinet woods, aromatic essences, etc. A list and description of even the chief of these would be too lengthy for this report. Besides over 200 varieties of palms, the forest contains over 25,000 different kinds of trees, all so scattered that it would be difficult to find more than two or three of the same kind in 1 square mile. It is perhaps due to the inaccessibility of the Amazonian flora, that building and cabinet woods are not exported. There are many varieties of elastic gums obtained from several orders of plants, and used for different purposes in commerce. The gums are commonly divided into two classes, viz, india rubber and gutta-percha. The principal commercial difference is that india rubber is elastic, whereas gutta-percha becomes hard when kept in a cool temperature. For this reason, the latter is used for the insulation of submarine cables. The best quality comes from the following places:

Rubber.—The first scientific description of the South American rubber tree was made by Aublet, a French botanist, who studied the plant in French Guiana. In 1775, he named the tree "hevea guyanensis." He stated that it is called "heva" by the inhabitants of the province of Esmeraldas, near Quito; "siringa" by the Garipou Indians; "pao seringa," by the Portuguese of Para, and "caoutchouc" by the Maina Indians. "Siringa" is probably of onomatopæic origin.

Upper Amazons, Lower Amazons, Madagascar, Akkra, Central America,

From the beginning of this century until about 1865, British and German botanists named the rubber trees "siphonia." In 1865, Muller reestablished the generic name given by Aublet.

Rubber was first introduced from South America into Europe in 1736 by the French astronomer, La Condamine. He reported that Peruvian Indians used it for various purposes. The Indians inhabiting the Amazonian forest were the first manufacturers of india rubber. An English artist discovered, in 1770, that the new gum was admirably adapted for rubbing out pencil marks. He wrote a paper on the subject, and informed his contemporaries that a cubic inch of this substance, costing only 3s., would last for years. It was used for no other purpose in England than effacing lead-pencil marks for about half a century after this discovery; hence the name "rubber."

The material was first manufactured into waterproof clothing in France towards the end of the eighteenth century. Later, the firm of MacIntosh, of Manchester, manufactured waterproofs on a large scale.

The "hevea" tree is not conspicuous; people have traveled thousands of miles through the rubber region and lived for years in the centers of the industry without even noticing it. The newcomer invariably expects to see the familiar glossy, dark green leaves of the Ficus. In appearance, the "hevea" resembles the English ash more than anything else. It grows to a height of upwards of 60 feet. The leaves are trifoliate. The blossoming season is in August, and the fruit ripens in December and January. The seeds should be planted as soon as

possible, as they soon lose vitality.

The localities where rubber trees thrive the best are on islands and low ground near rivers, where the banks are periodically inundated. Ground that is above water at all times or that has no drainage is not The peculiarity of this rubber tree is that it will not grow satisfactorily on cleared or opened ground. It requires the shade of other trees and still air from the time that its growth begins until it Without these conditions, the supply of milk becomes an adult tree. is very much affected. In fact, the tree has been known to die soon after the clearing of ground around it. No cultivation worth mentioning has been attempted in the region of the Amazon. It is considered useless to invest capital in cultivation, so long as the Amazonian forests show no signs of exhaustion. The "hevea" requires about fifteen years to mature. That is too long for the ordinary investor to wait. area that is known to produce para rubber amounts to at least 1,500,000 square miles. Further exploration will no doubt show that this area is far underestimated. On the River Aquiry or Acre, one of the tributaries of the River Purus, 200 trees yield as much as 3 tons of rubber per annum. Great quantities of "hevea" are known to exist on the banks of the Japura, but that district has not yet been opened up.

The Amazonas Rubber Estates Company, Limited (recently organized with headquarters at London with a capital of £300,000), will have its branch headquarters at Manaos. The director and his assistants are now on the ground, and instructions have been given to begin the collection of rubber. The company's property is situated nearly 500 miles from Manaos, on the River Teffe, and comprises 90,000 acres. The company has contracted for the construction of a steam tug to ply

between the estates and Manaos.

The State of Amazonas, like Para, has adopted a gold basis for its

budget.

The Rubber Estate of Para, Limited (also British, with headquarters in England, and branch office here), is a new concern with a capital of £350,000, owning an area of 284 square miles, or about 182,254 acres, containing 3,000 rubber roads, of 100 trees each. The output on these estates has reached in one year 322 tons, and with proper management,

I am advised by the most credible authority in Para, can easily be

increased to considerably over 500 tons.

The condition of the india-rubber market is one of exceptional activity, marked by daily and even hourly fluctuations. The past few days have developed marked signs of an upward tendency. It is impossible to calculate in advance the extent of the Para rubber crop, though, judging from the present outlook, there will probably be a very large increase over that of last year. It is certain that the rubber-producing area in this Amazon section, recently discovered and untouched, is hundreds of times larger than that now being worked. The price of crude rubber is fixed in the foreign markets, especially New York and London. The buyer, stationed here, carefully watches the market, and calculates his price in accordance with quotations received from those cities. It is very difficult to make a correct rate, so rapid is the exchange.

There entered this port during the fiscal year 1897-98, 22,257 tons of rubber, and of this amount, 11,422 tons were shipped to the United States and 10,796 to Europe. The State of Para does not produce more than two-thirds of the rubber shipped through this port, the balance coming from the State of Amazonas, as well as from Peru, Bolivia, etc. This city is a convenient shipping point, on account of its telegraphic and banking facilities. The principal bearing areas in the State of Para are the islands in the River Amazon, near the city, the principal, Marajo, having an area of 2,500 square miles; the banks of the river Tocantins; the banks of the rivers Xingu, Jary, and Tapajos. The upper and lower districts of the Amazon produce the same kind of rubber, but that coming from the upper river obtains a slightly higher price, being dryer by the time it reaches the port of shipment.

The collecting season in the Lower Amazons begins when the waters have subsided—about July—and ends in January or February. Collecting is not undertaken as a rule in the wet season, because the quantity of water that accumulates in the forest impedes the movements of the collectors, and the rain water that runs on the trunks of trees prevents the clay cups from adhering to the bark. The sap is also weaker

in this season.

The collectors employed are principally Brazilians, immigrants from the neighboring States of Ceara, Maranham, and Piauhy; also Portuguese and half-castes. The pure South American Indian is of very little use as a laborer. He has few wants, lives by fishing and hunting, and is less dependent on labor than more civilized people. There are many thousands of collectors in the rubber field, yet this number does not supply the demand. The last few years have shown a steady and rapid increase in the exports of rubber, and while labor has also gradually increased, it has failed to keep pace with the fast-growing demand. There has been a marked increase, however, in the laboring class in the last six months, on account of the droughts in the State of Ceara and the distress in the once flourishing State of Maranham, which, in former years, derived its wealth principally from cotton.

The governor of Para has recently issued an order directing that free passage be given to persons who wish to migrate hither from the drought-stricken regions of Ceara. No doubt, the effect will be an increase in the number of rubber gatherers available for the Amazon districts, which has already risen to large proportions, the last steamer from the south having brought about 1,200, making a total of 25,000 immigrants since the first of the year. Many of these, however, return to their homes as soon as they have accumulated a small competence. The

State has tried the experiment of introducing Spanish laborers, but in every instance, it failed.

Among other articles used in the india-rubber industry is a clay funnel, in shape very much like an ordinary toilet water jug, without a bottom or handle. It is made of the clay that is found in most parts of the Amazon region. The fuel used in the funnel consists generally of the nuts of the following palms: Native name—"Urucuri," "Tucuma," "Inaja;" botanical name—Attalea, Astrocaryum, and Maximiliana regia. It was at one time imagined that the excellence of Para rubber was greatly due to the kind of fuel used in curing it. The palms that furnish the fuel were accordingly transplanted to Africa, with a view to making Para rubber there. The experiment, however, has not met with success. The reason these nuts are selected in Brazil is because they emit a continuous dense smoke, and are more portable than other fuel obtainable. However, when none of the palms named are accessible, bark and twigs are used as fuel.

Everyone engaged in the forest carries a wood knife. One of its uses is to cut down fuel for the preparation of rubber; the blade is about 26 inches long and about 2 inches broad. All the knives are imported from the United States. Owing to the damp climate, the blades are electroplated, thus preventing their becoming rusty before they are marketed. The handles are made of wood, and are carved or inlaid

with brass.

The rubber collector's ax is a very small affair. It is required to chip a smooth surface on the bark preparatory to attaching a cup to the tree. The handling of the ax requires great skill in order not to injure the bark. A smooth surface is made in order to prevent impurities

from mixing with the sap.

The cups are of clay or tin. The former are attached to the bark by means of a little clay. Their weight, however, makes them inconvenient to carry when the trees to be tapped are separated by long intervals; the collector then prefers to carry tin cups, which are much lighter than the others. They easily penetrate into the bark by means of their sharp edges, and hold to the tree without the use of clay. The use of the tin cup, however, is to some extent injurious to the tree.

Part of the collector's outfit consists of a light gourd—large enough to carry the contents of from 500 to 700 cups. A clay bowl is next required in order to receive the contents of the gourd. It is of sufficient size to contain the product of several days' work before it is cured. The calabash tree provides calabashes which are employed to ladle the milk from the clay bowl into the mold. A broad bladed wooden paddle is used as a mold and is made locally. This completes the outfit for the rubber collector. All these articles are made locally with the exception of the knives. The axes and the tin cups are manufactured in the

towns and villages of the Amazon region.

The collector has to use his knite to cut his way through the undergrowth, and also to cut down a sapling occasionally to bridge a rivulet. At times he is knee-deep in ooze or up to his waist in water. On arrival at a rubber tree he chips away the rough parts of the bark, makes a more or less smooth surface, attaches a cup and makes a small gash above for the sap to fall into the cup, and repeats this process in a line round the tree until he has attached six or seven cups. Then he proceeds to the next tree and does the same. He continues this process until he has tapped from 75 to 150 trees, which can be done in a day if they are not too far apart. On the following days, the gashes in the

trees are made a trifle lower down than the first ones. Some collectors tap the trees in the morning and return to collect the sap in the evening, whereas others tap in the evening and collect in the morning. An expert gathers 7 pounds daily in the Lower Amazon; in the Upper Amazon, three times this amount is collected.

When the accumulation of rubber is sufficient—usually in three or four days—the collector lights a fire in the hut he has erected, places the funnel over the fire, pours a thin coat of milk over the paddle, and holds it over the smoke to coagulate. The process is repeated until a large cake has been formed. To release the paddle from the cake, it is necessary to make a slit on one side. The paddle mold makes a cake of uniform and even shape, and is in general use in the State of Para. In other parts, a spit is placed on two upright forked sticks, and given a rotary motion. By this means, the rubber is cured with greater ease. Paddle-smoked rubber is decidedly preferred, as it is drier and seemingly more carefully cured.

Many attempts have been made to introduce improved curing apparatus. Up to this writing, however, it has not been received with popular favor, because the common method, although very primitive, possesses the advantages of being simple and inexpensive. The process of curing rubber is extremely injurious to the eyes. Many cases

of total blindness result therefrom.

There are three grades of Para rubber, viz, fine, medium, and coarse. If rubber is not uniform and contains impurities, it is classified as medium. The coarse quality, or "Sernamby," consists of scraps that have not been cured.

Insufficient labor is the most serious difficulty in the rubber industry. It would scarcely seem advisable to invest money in rubber estates, unless the owner first can see his way clear to obtain sufficient labor with which to collect the rubber. In reality, the genuine owner of the

produce of the forest is the collector, not the laudowner.

As a rule, the landowner makes advances to the collectors for their outfit, food, etc., and in return receives the rubber collected by them. He sells the produce on the collector's account, retaining 20 per cent for himself, and continues making advances in such manner that the collector always remains in his debt and consequently in his service. It frequently happens, however, that the collector takes the advance and fraudulently disposes of the rubber to any buyer who may be on A great deal of leakage occurs in this way, and I believe no method of preventing it has been discovered. This is another of the difficulties of the landed proprietor. One of the methods in practice is to lease the trees in lots of 75, 150, or 200, at a given sum per annum, and to stipulate that the lessee shall sell the rubber and purchase all his supplies from the owner. The lessee works his lot to the utmost, and usually earns a handsome profit after paying the rent, and, although the owner does not obtain the full value of the lots rented, he makes up for it by charging commission on goods supplied, etc.

The profits of the rubber industry would seem to be large, because the employer keeps 20 per cent and makes about the same on the goods supplied the employees; but it must be considered that out of 100 employees, whose outfit and traveling expenses have been advanced, at least 75 die, desert, or return to their homes on account of illness. The expense incurred for them is accordingly a dead loss, and when this is deducted from the total income, the profit is greatly reduced.

The "aviador" is a person who advances supplies and capital to the rubber collector in exchange for rubber. The principal "aviador"

resides at the chief centers, and finances a number of smaller "aviadores," who travel about in the rubber industries. The exporters of rubber are mostly agents of United States and British importers. They buy from the "aviadores" in the principal centers.

The following table gives the monthly entries of rubber at the port

of Para, for the twelve months ended June 30, 1898:

	1	Shipments.			
, Month.	Entries at Para.	United States.	Europe.	Total.	
July	1, 130 1, 640 1, 890 2, 660	Tons. (a) 576 636 847 1, 013 1, 269 1, 566	Tons. (a) 375 372 664 624 1, 350 1, 769	Tons. (a) 95 1, 00 1, 51 1, 63 2, 616 8, 38	
Total	11, 440	5, 907	5, 154	11,06	
1898. January February March April June	2, 650 1, 750 1, 270 977	1, 428 1, 917 955 427 447 341	1,315 906 1,368 1,022 637 394	2, 743 2, 822 2, 323 1, 444 1, 08	
Total	10,817	5, 515	5, 642	11, 15	
Grand total	22, 257	11, 422	10, 796	22, 21	

a Of 2,204.6 pounds.

The following list shows the principal centers of production in the State of Para, and output during the year 1896-97 (later returns not being accessible at this writing):

Center.	Quantity.	Center.	Quantity.
Breves	667 565 507 449 477 467 439 375 339	Muana.  Mocajuba. São Sebastião Chaves Portel Bagre. Ociras Haião Aveiros Moju Abaete	15° 15' 14' 13' 13' 12' 18' 8' 7'
Almeirim	285 217	Alemquer	

The prospects for the crop of 1898-99 are promising, for the rains have not lasted as long as usual, and collectors can set to work earlier than usual. Two large steamships loaded down to their utmost with immigrants are now in this harbor, on their way to the rubber fields.

### COMMUNICATION.

There are four steamship lines that place Para in constant and rapid communication with the United States and Europe, besides several Brazilian lines that are engaged in the coasting trade. Two of the lines are British, one Italian, and the other is Portuguese. The Red

Cross Line and the Booth Steamship Line, Limited, are both of Liverpool, though each has a branch office at New York. Their combined fleets, I am advised, number something near forty cargo and passenger The steamers start from Liverpool, calling at Hamburg and Havre, Oporto, Lisbon, Madeira, Para, and Manaos, stopping at the same ports on the way back, with the exception of Oporto, Havre, and Hamburg. The call at Havre, I understand, depends on cargo, and Hamburg is not touched on the return voyage, as there is very little cargo for that port from Para and Manaos. The British companies have also established regular lines from Manaos and Para to New York and back, by way of Barbados. These two lines do all the carrying trade between the United States and northern Brazil. Both lines have been established for over thirty years. Neither is in any way subsidized, as I understand, and if they have obtained the greatest share of the carrying trade, it has been the result of untiring energy, perseverence, and excellent management.

The Ligure Brazilieira line of Italian steamers possesses three modern steamers that ply between Genoa, Lisbon, Para, and Manaos, calling at Spanish ports on the way. This line receives a subsidy from the States of Para and Amazonas. The Portuguese line belongs to the firm of Andressen & Co., of Oporto, and consists of two or three vessels.

The fare from Europe is only \$50, while that from New York to Para is \$90. The difference is due to the fact that considerable more competition is in force between here and Europe. The fare from here to Manaos is \$20, and the fare from Para to Iquitos, Peru, a distance up the Amazon of nearly 3,000 miles, is \$45.

As already stated, the New York lines are about to provide increased carrying facilities. I have it from a reliable source that five new steamers, with a capacity of 3,000 tons each, will shortly be added to the present fleet.

The French line of steamers, the Messageries Maritimes, is about to establish a line from here to the River Plate, taking in Rio, Montevideo, and Buenos Ayres. This commences to operate next month.

The Para Braganca Railway was built to encourage agriculture in the neighborhood of Para, but as Brazilians prefer to collect rubber, and immigrants follow their example, the result is that agriculture is abandoned and the railway is said not to be paying. The length of the road is seventy-odd miles.

A concession has been granted a foreign company to build a railroad between Alcobaca and Para da Rainha. The object is to establish communication on the Tocantins and Aragnaya rivers, over the stretch which is obstructed by about 100 miles of rapids.

The Amazon Cable Company has established cable communication with all the principal ports of the rivers of the State. The line to Manaos is one of great importance. The commercial development of Manaos depends upon it to a capacide cable content.

Manaos depends upon it to a considerable extent.

The steamship lines running between here and

The steamship lines running between here and New York advertise to leave Para on the 4th, 14th, and 24th of every month, but, unfortunately, they often fail to leave on scheduled time. Two hundred and fifty thousand dollars' worth of rubber and other goods were purchased for shipment to New York by the steamer which was advertised to leave on scheduled time, September 24, 1898, but, unfortunately, the boat failed to appear until four days later. There was general dissatisfaction, as there is a tremendous shrinkage in rubber every twenty-four hours, and the loss is heavy. Perhaps, if the press would take hold of this matter, it would have a tendency to stimulate the steamship lines

to either leave as advertised or furnish a substitute steamer. It appears that the steamer called at Manaos, and for some reason or other was delayed. Meanwhile, the cable, as frequently happens, was not in working order, and it was impossible to learn the cause of the delay.

The rate of freight from Para to New York is 25 cents per cubic foot, or, as I am informed by merchants, about 17 per cent less than it is

from here to Europe.

#### EXCHANGE.

The rate of exchange for the year 1898 has ranged from  $5\frac{2}{15}$  to  $8\frac{1}{16}$ . The market has been subject to extreme fluctuation the past six months. The cable not being in good working order at times, renders it all the more dangerous to rubber dealers.

### GENERAL REMARKS.

The absence of proper banking facilities is sometimes exceedingly awkward for Americans. Why can not the United States inaugurate a system something after the order of the English banks? It would greatly simplify matters. As matters now stand, we are compelled to seek relief through English banking houses, at great inconvenience and cost. This rich field is surrendered to Europeans. England is well to the front, energetically preparing to take steps to increase her lead. The amount we pay our competitors for carrying charges will aggregate, in this port alone, high up in the thousands. We are actually furnishing our opponents with the necessary tools with which to defeat our purpose. It is to be hoped that speedy steps will be taken to enable us to be on equal footing with all comers, and the sooner the better. With measures taken to remedy the prevailing evil, I feel confident that in the not far distant future Americans will be leading in the field.

If the few thousand miles of railroad necessary to connect this country with New York were completed, it would give the United States a distinct advantage, and, in fact, overcome competition. Exports are handled by the State department, and the revenues belong to the State of Para. This department is splendidly organized and most admirably

managed and issues regular annual statistics.

Through the courtesy of the administrator, I am accorded the privilege of supplying official information with regard to the amount and distribution of the principal exports. I am indebted in a measure to the various merchants through the city of Para and Manaos, for the valuable and indispensable information received at their hands, as well as to the chamber of commerce, the governor of Para, and, last though not least (one of "Uncle Sam's" stanchest and most loyal friends, yet a Brazilian), Hon. Theo. L. Chermont.

Export duties provide a trifle more than three-quarters of the revenue. Out of two million and odd dollars collected on exports, one million nine hundred and some thousand was collected on rubber alone, which is taxed to the extent of 23 per cent. During 1897-98, the public expenditure is said to have reached 18,975,853 milreis, being 2,795,367 milreis in excess of the receipts. The result is brought about by the State of Para spending a large portion of its revenues in public works. Para is not only one of the finest cities in Brazil, but will bear favorable comparison with cities of its size in most parts of the world.

There is a drummer's license law here of \$100, but I am told that it is not enforced. At least a drummer is scarcely ever called upon for a license, unless he stops over indefinitely and undertakes to locate for

the purpose of exhibiting goods. Even then I doubt whether a license would be required, especially if one can rely on the information I have obtained in reference to this subject.

The prevailing diseases are yellow fever, beri beri, malarial and other

complaints prevalent in tropical countries.

Several large syndicates have passed through here within the past six weeks, seeking both rubber and gold fields. They are composed principally of Europeans, though two are from the United States.

On every side one can see unusual activity in Para, such as erection of hotels, business houses, the fast climbing walls of the new custom-house, or exchange, as it is sometimes termed, which will be completed, it is said, before the end of 1900. This splendid building would grace any city, being made of solid stone and marble throughout. Other public works will be begun in the early future, such as the erection of markets, schoolhouses, and warehouses, street paving, drainage, opening of avenues, sewerage improvements, etc., and possibly, improvements to the port.

The iron electric posts on which the city trolley railway will be operated are already in position, yet it is difficult to predict the date on which this line will be put into operation, action having been suspended on account of insufficient funds with which to continue the work.

On the 11th instant, two additional steamships reached here loaded

with American coal.

### HOW TO EXTEND UNITED STATES TRADE.

The methods of increasing United States trade have already been dwelt upon. It is of the highest importance to establish a permanent agency to exhibit American goods for the inspection of the buyers. Broad terms of credit, such as are offered by Europeans, should be allowed customers. None except the most competent agents, speaking the language of the country, should be selected, and they should be supplied with samples and illustrated catalogues. If United States manufacturers are seeking to find a lucrative field to market goods, I do not hesitate to say that this district and surrounding country offer many opportunities; but competent men must be sent to familiarize themselves with the market, study the possibilities, the banking system, the prevailing customs, methods of payment, terms of credit, the shipping facilities, freight charges, tariffs, etc. Illustrated catalogues, circulars, pamphlets, etc., will not do the work alone. Agents must be on the spot.

Most merchants insist on seeing samples and learning the exact price an article will cost delivered here, freight, duty, and all other charges

paid.

### TEMPERATURE.

The following meteorological statistics were obtained from the museum of this city (Para) for the year 1897. While it is said that the year of 1898 has been decidedly cooler, returns for said period are not accessible.

	۰F.
Mean maximum temperature	87.6
Mean minimum temperature	71.9
Mean temperature	70 R
Maximum temperature	01 2
Minimum temperature	67 6

The rainfall during the year 1897 amounted to 115 inches. Rain fell during 291 days in the year, and the maximum during one day amounted to 3 inches.

The wet season is from January to June, when it usually rains three

times as much as from July to December.

The following table shows the quantity of produce of the State of Maranham during the calendar year 1897. Later returns are not accessible, and it is also impossible to find out the proportion each country consumed.

Articles.	Articles. Quantity. Articles.		
Balsam tons	11	Pork tons.	85
Beans do	98	Ricedo	2, 495
Beef, dried do do	104	Rumgallons	186, 705
Bricksthousands	65	Seeds:	,
Bullocksnumber	14, 140	Castor oiltons	245
Cottontons	2, 286	Groundnutdodo	104

Andirobado	1, 116	Logsdo	7,508
Pigsnumber	991		.,,,,,,,

The import duties amounted to something like 700,000 milreis on the above articles; export duties, 300,000 milreis. It seems that I will not be able to get a full report of either imports or exports from the State of Maranham.

K. K. KENNEDAY, Consul.

PARA, October 13, 1898.

#### BAHIA.

Trade in this district presents a number of peculiarities at this time. Export business is flourishing, but there is little profit in it and much risk. This is in part due to the great decrease in the prices of Brazil's staples in foreign markets, and to the fluctuations in exchange and

consequent losses.

All products exported are purchased for houses located in Bahia and having numerous agents in the interior. On account of the lack of railroads, products purchased are often four or five weeks reaching here, and, because of the lack of telegraphic communication and the great length of time taken to reach the interior by mail, it is impossible for the agents to keep in touch with the head of the house and be informed of the frequent fluctuations in exchange. As a result, goods are frequently purchased in the interior for more in milreis than the gold for which they are exported will bring, and for the past few months, the exporter has either been a loser or has had his profits cut down to almost nothing.

Digitized by Google

Import business is at a standstill, and has been in that condition for several months, importers buying only that for which they have an immediate self-section and several months.

immediate sale, and carrying as little stock as possible.

The cause of this stagnation of business is said to be due, first, to the great recent fluctuations in exchange; second, to the decline in the gold price in Brazil's staples, and third, to the drought.

### EXCHANGE.

Brazil is virtually on a paper basis, and during the first five months of the year exchange had a constant downward tendency until May 13, when the milreis reached its lowest value on record, and was worth about 11 cents of our money, or 23.3 per cent of its par value. From that date there has been a steady upward tendency until to-day (October 15) it is worth  $17\frac{1}{5}$  cents of our money, or 31.1 per cent of its face value, having increased almost 11 per cent meantime in par value. So great have been the fluctuations, that in two days the milreis increased 25 per cent in value, while in a few hours the fluctuations have been from one-eighth to  $1\frac{1}{4}$  cents, United States currency.

As a result of the rise in exchange the farmer, producer, importer, and even exporter is suffering, for what affects one affects the other. The main staples are worth less in gold and consequently bring less in milreis, having a greater gold value, while the products have frequently cost the farmer, producer, or exporter more in milreis than he can get in gold when selling. True, the milreis now has a greater gold market value, but it buys no more in the market here than it did when at a lower rate, and it has the added disadvantage of scarcity. Farmers can not purchase as much as they otherwise would, thus the demand is less

and the supply has fallen off proportionately.

I can not find that the rise in value of the milreis is based upon any firm foundation, but am told by the banks that it is due to the faith in the new financial policy which, it is rumored, the incoming administration will adopt. It is hoped that exchange will soon reach some stable rate. In the language of a prominent bank manager, "the present fluctuations not only subject firms to ordinary business risks, but make what should be legitimate business a constant game of cards, with the accompanying uncertainty as to success."

#### TRADE METHODS.

That even the little business that is being done here is worth something, is shown by the effort being made by the German and English concerns to get it. That the United States has not a greater proportion is due to its lack of effort and to its insistence that the Brazilians accept our business methods.

The chief causes of complaint against our merchants and manufacturers is their demand for cash, their faulty packing, their roundabout way of dealing, their inattention to what seems to them little things, and their refusal to cater to the market.

It is the custom of the country to get from thirty to one hundred and twenty days' credit for purchases abroad, and you can not induce the merchants to buy for cash, even if you offer large and liberal discounts. Germany and England cater to their wish, and attach time drafts to the bill of lading and invoice, and forward them to a bank here with the instructions to deliver the papers against acceptance of the draft.

The English and German firms also include 6 per cent interest for the days of sight of draft, and add two months for the time consumed in getting the draft here and in the return of the money after collection, making an allowance at same rate if the draft is met at any time prior to its falling due.

This asking for time for payment of goods has some reason. It takes from four to eight weeks for goods to arrive here after ordered; then they remain before the custom house for two or three weeks, awaiting their turn to be discharged; and, having arrived in the custom-house, it takes anywhere from two to six weeks to get them out and on the market. If paid for in advance, the merchant would be without the use of his money for all this time, and meantime, exchange might have fluctuated so much that had he paid the cash with the order he would perhaps have paid 2 milreis more to the dollar for the goods than they would have cost him on the day he put them on the shelf; while his next-door neighbor, who ordered at the same time and is to pay in the future, sells for less in milreis than the goods cost the one who paid Of course, should exchange have fallen in the meantime, the reverse would be true; but the merchant never sees it that way, and prefers to be able to set the price in milreis on the goods on the day the goods are actually received, and the price once made is seldom changed, no matter how the exchange fluctuates.

Manufacturers in the United States say that they can not do business on this long-credit system, on account of their need for cash or because they have no way to ascertain the responsibility of firms so far distant. If the first reason holds good, they should not attempt to enter the Brazilian market. As far as the second reason is concerned, it is the experience of all who do business with this place that there are fewer business failures and less money lost in trade with this district than would be the case in a similar volume of business in the United States.

It is always possible to find the business standing of a firm by having the home bank write to a bank here requesting information. In this way, full and accurate details can be obtained at the cost of the necessary postage. In the case of a salesman coming here, it would be well to bring a letter of introduction from the home bank. Upon presentation of the letter to a bank here he will be furnished with sufficient information relative to the standing of the firms with whom he expects to do business, so that he will have little risk to run so far as losses are concerned. All information will be given free, with the expectation of course that the bank giving it will have the handling of the firm's paper here. A bank, though, will give another bank more detailed information than it would give a private individual.

It is best to send all drafts, etc., through a bank and let it do the collecting, on account of its greater responsibility and its better knowledge of the business firms, as well as its punctuality and business-like principles; and whatever services it may render are a charge against the acceptors of the draft.

Buyers here want to deal direct with producers, and in this line our merchants make two mistakes; first, by imagining that they can appoint someone at some one port in Brazil either sole or distributing agent; and second, by attempting to deal from the United States by second or third hand.

Each port in Brazil is as independent, so far as trade relations with other ports of Brazil are concerned, as might be the case were they in different hemispheres. Such national products as are protected by heavy duties are obtained from home markets, but all goods imported are imported direct for each port. This is both because the merchants wish to figure as "sole importers" and insist on the lowest possible price, and because to ship from a foreign port to some one port and then reship, would make the products cost very much more in the second port than could possibly be the case with direct importation. The trans-Atlantic freight would be the same to any port, but there would be the agent's commission, extra cost of handling, perhaps repacking, the State export tax, the municipal import tax, the high coastwise freight, to say nothing of the great loss of time that would be frequently involved.

As an example of the trouble to which our firms frequently put prospective purchasers, I have but to relate an incident that recently came under my observation. An importer saw a novelty brought out from the United States, liked it very much, and thought it salable here. He wrote the makers, who referred his letter to their sole export agents, who wrote that they could not give prices, as they had put the Brazilian business for that article in the hands of a New York commission house, but that they would write the house to communicate with him. The New York house referred to does a large business here, but entirely in such staples as flour, coal oil, tallow, etc., which it can handle to a better advantage and sell with larger profits and less expenditure of energy than could be hoped for, if it devoted time and energy to this particular novelty. The firm has doubtless not had the time to write, or is still referring the letter to some subagent. Meantime, the man here is purchasing a very clever imitation of the article from a firm abroad, that was glad of a chance to deal direct.

The above is but one of a number of examples that tend to prove that while our manufacturer of small capital may deem it advantageous to deal through second or third hands, the firms here can not be led to see the advantage, and things so handled must cost more. The commission house in the United States will give attention to those things meeting with most ready sale, and the export agency should not be of such exclusive character as to prevent the manufacturer dealing direct, should the occasion arise. Such a thing could easily be done by allowing the agent a commission on such sales. If there has to be a commission agent to furnish the cash for the sales, it would be well for the manufacturer to put his own man on the road to show the goods, and take orders to be sent through the commission agents. Until something like this is done, our manufacturers can not hope to obtain a

large or profitable market in this section.

Another example: The salesman for a German make of pencils tells me that if it were not for the commission paid middlemen by the United States manufacturer, he could hardly get an order for pencils in South America, while now he supplies three-fourths of the market. He says that the greatest number of pencils sold are the cheap unvarnished variety, and as Germany has to go to Florida for her pencil wood and has the cost of transportation to pay, and also pays a royalty on American machines used in the business, the Germans could not compete with our manufacturers who are not subject to these expenses if they did not sell direct, while all sales from the United States go through two or three hands, each one making a profit. As a result, the German firm is able to sell for less than the pencils can be obtained from the United States, and still make a profit.

Packing.—Firms exporting to this market should study the tariff carefully, and such articles as pay duty by weight should be packed in

as light a case or package as possible. Some firms want goods packed in peculiar ways. For instance, some want an inner air-tight case of tin or zinc, some want cases lined with cheap mackintosh, some want cases covered on the outside with burlap, and others will give no directions. English and German firms pay a great deal of attention to packing, cater to the wishes of their customers, and charge them extra for departures from their usual methods. Our firms pack as suits their convenience, not seeing the reason for a departure from their custom, and not even making a change when requested to do so; yet it is attention to these seemingly little things that gets business. If no packing directions are given, common sense should at least be used.

As an example of our careless methods of packing, a couple of months ago one of our firms consigned two pretty, yet cheap pianos to a firm here. When the crates were opened, the pianos were found to be warped out of shape, the veneering was dropping off, the keys had swellen and were bulging in all directions, and the felts had nearly all come off. The instruments were in a very bad condition, and it cost a great deal to have them repaired so that they would be at all salable, and they could not be made as good as new. All of this trouble and expense might have been saved, if the shippers had put the instruments in airtight metal cases before putting in the wooden cases—following the

custom of German exporters.

Of late, some importers have been having their cases wrapped in burlap. There having been many losses by stealing during the transit from maker to purchaser, and, it seeming impossible to locate the theft, they have taken this precaution, thinking that any tampering could be detected and perhaps the culprit found. While I would not advise this method, yet it is absolutely necessary to securely pack cases, and bind them with wire or hoops so that they can not be opened except with a great expenditure of time and labor, and, having been opened, the fact could be easily detected. The losses by theft from careless packing are very great, and though our merchants may insure all goods against loss by fire, water, and theft, yet, to the importer who has ordered the goods only a short time before he needs them, reimbursement for stolen goods can not make up for loss of trade. In packing, as large cases should be used as possible, as they lessen freight, lighterage, and customhouse storage charges.

Marking.—Cases should be plainly marked and numbered, and the invoice should show exactly what is in each case. Our merchants pay little attention to these details, and, as a result, the importer pays duty on a heavy case, is fined because he can not state the exact contents of each case, or is delayed because he does know the weight of each article which is taxed by weight, or can not say in what proportions each article is made. As a result of negligence, some of our firms get one order and wonder why they can not get another, since their prices are

better and their terms as good as those of any European firm.

The Germans take particular pains with their invoices, and include everything that could be of service. With them, each case has its number and separate invoice. This invoice shows number, gross and net weight, name and cost of each article, together with the classification of each article in accordance with the Brazilian tariff. Then, to the total cost of the contents of case is added the itemized statement of charges as follows: Freight, if any, to port of shipment, drayage and other small expenses, maritime freight, consul's fee, fee for obtaining bill of lading and stamps for same, extra packing expenses, insurance, Brazilian impost stamps for drafts, commission (if the business is done through a commission house), and total of all expenses. Then follows "Case

marked — (No. of case), sent via — steamer and payable against our sight draft of — days at — Bank." An invoice conveying all of this information is made out for each and every case. Such information impresses the buyer with the business-like principles of the house, as all the desired information is given in detail and the invoice so impresses the custom-house authorities that they pass the articles quicker, with less trouble, and perhaps at a lower rate of duty than the same things would have cost, with just the plain statement which our firms send, leaving it to the authorities to find out the composition of the articles and classify according to their wishes.

Accompanying the invoice, which should be sent by mail, should be a small numbered sample of whatever textiles there may be in each case. The sample should give proportion and approximate weight, in accordance with tariff regulations. This is shown by the custom-house broker to the inspector when requesting the dispatch of the goods, and the convenience of examination may lower what may otherwise be a

high duty.

Accompanying a case of textiles should be a reference card labeled with the name and address of the "sole importer." This serves not only as a sample card to show prospective customers, but can be used for reference by the importer, who frequently keeps his stock stored in

the original case until there is a chance for sale.

Our manufacturers think that because we manufacture as fine goods as can be found in any market, foreign markets should be more than satisfied with them and not wish an inferior article. Yet there is a very large trade in inferior articles, and the purchasers know the quality when they buy. The Germans cater to every whim, and not long ago a salesman showed me shirts which they were sending to this market at about \$1 a dozen and which he would guarantee would fall to pieces before they were washed six times. Yet he sold a great number of those shirts and only a few of his better grades. He said he told the buyers of the worthlessness of the cheap shirt, and they replied that that was so much the better, as the shirt looked well to commence with. and the fact that it would not last would cause them to sell more. it is with the demand for cheap cutlery, the edge of which will disappear after the first use. Germany manufactures better articles. In fact, these poor articles are not in stock, but have to be manufactured after the receipt of the order. Almost all that Germany sells is by sample, and any changes the buyer wishes will be made. This, together with the fact that the articles are made within four weeks after their receipt in Germany, attracts a number of buyers. It is to be hoped that we will never manufacture such truck, yet I am convinced that it would pay us to be a little more obliging by complying with requests for assortments. For instance, a recent American salesman could have sold a number of yards of prints here, but his firm insisted on selling a whole case of one design and color instead of furnishing an assortment of designs and colors. The buyer here insisted on an assortment; indeed, he would have preferred cases made up of half pieces and each piece of different color or design. England and Germany cater to the local demand, and to such an extent is this assortment idea carried that one can not buy at any store enough of the same design and color to make more than two dresses. There may be half a dozen pieces of the same design, but they will all be of different color. Even the two large merchant tailor establishments import their trouserings in onetrouser lengths and all different, and their suitings in lengths allowing not more than enough for half a dozen suits. Of course, this does not

apply to such staples as full blacks or blues, but to combinations of colors and designs.

#### BEST WAY TO REACH MARKET.

Firms are constantly asking for the best methods of doing business here. The best would undoubtedly be for a number of firms representing various lines to combine, send a complete line of samples, rent a showroom, and employ a good man who can speak Portuguese to take charge of the exhibition. It would be well to keep a small stock of the most salable things to be drawn upon to fill orders, and thus avoid the great delay frequently occasioned by awaiting the arrival of goods.

A large showroom would not cost more than \$600 per year, and a good man could be had for \$2,000 and expenses, and the whole expenses divided among the different firms would make the cost to each very little, while the benefit could not be overestimated. This manager could either go to near by points or have prominent merchants come here from time to time, and could not only control the Bahia market in his lines, but make inroads into other markets now entirely unknown to the United States. He would be of the greatest value, if he did nothing more than keep his firms informed as to the ever changing needs of the market, and openings for new and profitable lines.

The next best method would be the employment of a good traveling salesman with as full a line of samples as possible. He should not be hampered by set instructions, but should be a man of good sense and allowed to use his judgment. He should have no time limit for any place. It takes time to do business in Brazil, and often a great deal is consumed in getting merchants to come and view samples, even after they promise to do so. The first word to learn is "patience." Business is carried on here very differently from in the United States, and the merchant at home can have no idea of the amount of trouble and worry a salesman is subjected to here. He can not go into a store with his samples as at home, but has to invite the prospective purchaser to come and view them, and the latter takes his own time about coming. A firm should not get discouraged if, in the first trip, its salesman does not even make his expenses, for the business acquaintances that he has formed and the knowledge he has gained of the needs of the market and the trade methods of the places to which he has been, will be worth much to his firm, and upon his next trip in the same locality, he will probably be able not only to make up for the losses of the first one but to return a handsome profit.

Several German and English travelers have told me that they did not make expenses on their first visit. One of these has just left after a two months' stay; this is his third trip and very little business is being done, but he has orders amounting to \$12,000 and no one order exceeds \$500. He also informed me that this is a market for an abundance of very cheap and shoddy things; that no middle grades are sold, but a

fair quantity of fine goods.

Another method is sending out catalogues, circulars, and price lists printed in Portuguese. Do not send English literature under any circumstances, and do not have some novice translate the English into Portuguese and do it so poorly that the firm will be held up to ridicule. I am firmly of the opinion that shiploads of circulars will not do as much good as one salesman knowing the language, or in lieu of that, Spanish; all the English he may know will be of no particular service.

Recently, there has come to my knowledge another method which, with a few changes, would be very good. A firm has been organized in the United States to introduce into South American markets the

products of manufacturers. The manufacturer pays this firm a stated sum per year. Such samples as are deemed best are supplied, and in some cases, trial shipments are made. The firm has an office in New York where one member attends to the correspondence, superintends shipments, etc., and the other member is constantly on the road. The traveling member goes to the chief cities in South America, where he finds stock or samples awaiting him. He appoints some importer as an agent, explains the business, and leaves the samples. The agent appointed acts as a local salesman, shows the goods, and takes whatever orders he can, forwarding them to the head firm in the United States, and the goods ordered are sent direct from the manufacturer to the intending purchaser.

Should the importer wish to buy through a commission house, the local agent so advises the firm, and the agent still draws his 5 per cent commission. All that the manufacturer wishes is to receive the order from some source, and to know that the order is the result of the agent's effort here, though it is possible to buy at a slight reduction through The charges for all this work are borne by the varithe local agent. ous manufacturers, so that there is but a slight expense for each one, and the method has the advantage of having a man on the spot familiar with local needs. There is recorded in the laws of this district a high license fee to be assessed against all commercial travelers; but there is a way that this can be avoided, which information, as well as many other facts that would be of value to one new to this market, can be obtained at the consulate.

Two of our greatest needs in trade relations with this country are the establishment of an American steamship line and branch banks. This district is dependent entirely upon one steamship line to and from the United States, and as a result, rates are what the company cares. to make them. There are a number of European lines touching here, and accommodations for passengers and freight are much better than from the United States.

Freights to and from the United States from this port are much in excess of the rates on the same line to Rio, yet Rio is three days farther distant. The chief reason for this is that there is more competition. I have known coffee to go from Rio to the United States for one-third the price charged from here, with the coffee from both places on the same steamer. The shippers here have complained against the unjust dis-

crimination, but are powerless to do anything.

In September, all the European lines advertised a reduction in freight, while the rate from the United States, always in excess of that from Europe, remains what it was. All of this operates to hurt our export trade, for even though our prices for goods may be less and terms as favorable as those of European merchants, the freight charges make the articles cost more in the long run, while the slowness of the steamers makes Europe a week nearer, to say nothing of the time lost on

account of lack of frequency of boats.

If we are to hope for foreign trade, we should have our own line of boats, as do other commercial nations, and should patronize it. I am sure that with the dissatisfaction with present transportation facilities that seems to exist, an American line would soon obtain patronage. In fact, I have been frequently told by firms who ship almost all that goes to the United States, that they would agree to ship only by the American line, should one be established. The present line has collected for freight charges alone on shipments from here, for the year ending June 30, 1898, the sum of \$137,724, to say nothing of its passenger traffic or the freight collected on goods from the United States.

## BANKS AND BANKING.

It is impossible to tell how much the United States sells to Bahia, but Bahia sold to the United States \$2,785,361.44 last year, and the paper representing all of these transactions passed through London, leaving there one half of one per cent besides what the United States lost in local bank charges. There are two English banks here—the British Bank of South America and the London and Brazilian Bank—and through them, about all of this business is done. Though these banks do an exclusively exchange business, they make enough to give an annual dividend of 14 per cent, and each year put aside a good large sum as a surplus fund.

I would not advise the establishment of a bank here to do other than exchange business and attend to collections; but with branches at Para, Pernambuco, Bahia, Rio, Santos, Buenos Ayres, and Montevideo, I am convinced that it would return a good dividend for the capital invested, and would be hailed with delight by the exporters and importers doing

business with the United States.

### IMPORTS AND EXPORTS.

It is impossible to give the value of the imports in this district, so far as the value of different articles and the origin of the same are concerned. From January 1 to June 30, I ascertain that the United States monopolized the trade in coal oil, rosin, turpentine, and barbed wire; supplied great quantities of flour, lard, butter, lubricating oil, railroad equipment, and watches; did a considerable trade in tacks, pencils, blacking, oars, pitch, cotton goods, phonographs, and numerous small articles, and could have done a much larger business along these lines.

England sold hams, canned milk, lobster, salmon, all of the coal and whisky, sewing machines, linseed oil, lead and lead pipe, iron and steel of all varieties, white lead, copper, tin, shoes, cotton goods of all descriptions, paints, varnishes, jute, hats, and much small wear.

Argentina supplied corn and hay, for which it had an exclusive

market, and immense quantities of wheat and soap material.

Uruguay sold large amounts of jerked beef, and Italy supplied candles, sweet oil, vermuth, and quantities of barreled wine, some cotton goods, preserves, and cheese.

Portugal supplies wines, beans, preserves, sweet oil, figs, potatoes, onions, and sardines. Newfoundland has a monopoly in the codfish

trade.

France sends wines, particularly claret and champagne, butter, glove leather, buttons, silks, umbrella frames and materials, corks, challies, clocks, acids, benzine, perfumes (large quantities of which are used), glassware, crockery and china, acids, and many chemicals.

Holland supplies gin, nearly all the cheese (there is an immense

amount imported), crockery, umbrella frames, etc.

Austria supplies flour, steel, manufactures of iron and steel, glass-

ware, crockery, and a little general merchandise.

Germany furnishes large numbers of fancy colored cotton shawls, hosiery, glass and its products, musical instruments, paper, hardware, shirts, knives, pencils, canned goods, collars, cuffs, and handkerchiefs, and considerable amounts of paraffin, lead in pipes and blocks, and all kinds of manufactured goods, imitations of other nations' products, mostly of a cheap variety.

Frequent application is made to this consulate for a list of United States products that might be salable here. With proper effort, we

could sell canned lobster, salmon, fruits, vegetables, and milk (large quantities of which come from Europe), bicycles, rice, cocoa, machinery for cleaning, roasting, and grinding coffee and preparing farina for market, various kinds of electrical apparatus, charcoal, gas, coal oil, wood and coal stoves, picture-frame moldings, bolts, screws, nails, wheelbarrows, cheese, corsets, suspenders, lamps, fine shoes, printing inks, type and printing machinery, lead pipe and block lead, and many American novelties. In any of these lines, with proper attention to business, large sales could be made.

There could be no better place for some one with necessary capital to establish the following industries, which are so protected as to make importation impracticable: First. A factory to make first-class furniture out of native woods. The finest of woods are easily obtainable, and that there is a positive liking for American styles has been shown by recent auctions, when second-hand furniture of that class, after four years' use, brought three times its original cost. Second. A factory to make sash, doors, blinds, and do general cabinetwork, all of which is now done by hand, with crude tools. Third. A factory to make modern shoes, all of which are now imported, with a very high duty. Fourth. A pottery, brick, and tile factory, there being an abundance of good clay and kaolin at hand and a large demand for all of these Fifth. A paper factory to manufacture coarse paper from plant pulp or finer paper from rags, there being a number of plants suitable for the former, and rags, which could be used for the latter, being now entirely thrown away or destroyed. Sixth. Print and bleached cotton There are none here, and the demand for both kinds of goods is very great. The native mills are all good paying investments and can not supply the demand for the class of goods they now make. Abundance of cotton is near at hand. Seventh. A small manufactory of modern fireworks would pay well, on account of the daily demand, to say nothing of the vast amount consumed on the many feast and saint days. The class now on sale is an inferior grade of home manufacture.

### CROPS.

Coffee, one of the chief exports, has fallen so much in price that its cultivation has ceased to be profitable, and many large planters will not even gather the crop ready for harvest, but instead, are turning their attention to sugar and the manufacture of native rum therefrom, for which there is always a good local market. Other planters are devoting their time to rubber and cocoa raising. The crop to be gathered is estimated at 300,000 bags for the country directly tributary to this port.

Cocoa, on the other hand, has so increased in price abroad that, even with the comparatively high exchange, it is worth more in milreis than was the case this time last year. The crop being harvested is estimated at 90,000 bags for the Bahia district, but will probably be con-

siderably more.

Sugar, on account of the drought in the sugar-growing region, will be a short crop. It will fall far short of the actual demand, and consequently, will bring a better local price than one could hope to get for export; in fact, sugar is being imported at present to meet local consumption.

The production of rubber will be about double that of last season. It is mostly of a poorer grade, due in great part to lack of proper preparation for the market, and consequently does not command a good

price.

Hides and skins are affected by exchange, and though the gold prices remain firm, the producer is making little. On account of the drought, great numbers of cattle and goats have perished.

Tobacco has also been affected by the drought, and there will be a shortage. That not affected is of a good quality and is commanding a

better price than heretofore.

Piassava and coquilhos are commanding good prices, but the people seem to be content with that which nature produces without any effort on their part, and as a result the supply is limited, though the demand is great.

# COTTON GOODS.

So far as can be ascertained, there is no particular width or weight of cotton sheetings and drills peculiar to this market. Standard European goods are bought on all occasions, though the purchaser always wants to know the weight per meter, as the duty is by weight. For full information along this line, this consulate is preparing a special report.

Volume of exports from Bahia from January 1 to June 30, 1898.

From the above table, it will be seen that Uruguay and the United States were the only countries not carrying their imports from here under their own flag.

H. W. FURNISS, Consul.

Bahia, November 4, 1898.

# PERNAMBUCO.

If properly handled, United States goods will constitute a large share of the imports into Brazil. There are many openings for textiles, hardware, nails, etc. My attention has been called to the necessity of making hinges of a style desired and used in this country. Agricultural machinery should be brought here and introduced by competent people. Our bicycles are being introduced, and all prefer them, though the roads are in such bad condition that there can be no extensive use in this district. Small hardware is in demand, but must be made to suit the trade, and well put up in proper packages.

This is an opportune time for the introduction of United States textiles, dealers preferring them to all others, even on thirty days' credit, as against four months from Europe. A concession in this direction would work well.

Our boots and shoes are in demand, particularly for women and children. There is a good opportunity for the introduction of our files and saws, which now come here through English houses.

The chance for American coal was never better, but it should be screened. Spruce and hard-pine lumber, suitable for packing cases and boxes, is in great demand.

The extension of a parcel-post system to this country would be a great boon, and open up new lines of trade. There should be increased care in attending to orders and having goods properly packed, so that they will not arrive damaged. The contents and weight of each package should be carefully noted and goods packed in as light a manner as possible, as duties are paid on gross weight.

Trade is best managed by having experienced commercial travelers, who can speak the Portuguese language, make trips about six months apart, and by paying strict attention to their orders and directions. Usually "something just as good or similar" will not please this people.

<sup>&</sup>lt;sup>1</sup> In reply to circular of August 5.

The lack of a very small and apparently insignificant part of a machine renders the whole thing useless, and sometimes three to six months are necessary to replace it. These things should be kept constantly in mind, and the greatest care exercised to see that each shipment is complete in itself.

Exports declared from Pernambuco and agencies for the six months ending June 30, 1898.

It is impossible at this time to obtain reliable information concerning the amount and value of imports.

### CURRENCY.

Changes in the gold value of the monetary unit, ranging between 5§ to 7½ (10.81 to 16 cents) per milreis, have occurred almost daily. Drafts are sold by the banks upon the United States, but at a higher cost than is charged for bills on London, thus emphasizing the need for an American bank, for which there is an imperative demand.

#### CUSTOMS DUTIES.

There have been no marked changes in customs duties or regulations, except that the new inspector has made a new classification in oils, classifying lubricating oils as animal oils, thus raising the tariff from 70 reis to 300 reis (4.2 cents 1) a kilo (2.2046 pounds).

### TAXES ON COMMERCIAL TRAVELERS.

Ceara, 500 milreis (\$70); Maceio, 12 per cent over custom-house charges; Pernambuco, nominally 200 milreis (\$28), but rarely collected. Passports are not required at this port.

# FREIGHTS.

Information gathered from all the agents of steamship lines running from the United States to this port, shows no change in rates during the past six months.

<sup>&</sup>lt;sup>1</sup>Taking the value of the milreis as 14 cents.

## CHILE.

### VALPARAISO.

Pursuant to the circular from the Department of State, dated August 5, 1898, I herewith transmit a report of the commerce and industry of this consular district, as well as of the Republic of Chile, for the year 1897, including the latest statistics obtainable at this time. In this report is also included a résumé published by the Chilean Times of this city, relating to the trade of Chile for the year 1897, its industries, national finances, etc.

[From the Chilean Times.]

There was a very considerable falling off in the volume of trade in 1897, as compared with 1896. Before, however, proceeding to give the figures it will be well to point out that, as usual, the values are given in dollars of 38 pence. The value, then, of the imports was \$65,502,805 (\$50,437,160), and that of the exports \$64,754,133 (\$49,860,682). The total value of imports and exports was \$130,256,938 (\$100,297,842), or \$18,185,281 (\$14,002,666) less than the total in 1896. In this decrease of \$18,185,281 (\$14,002,666), imports figure for \$8,580,000 (\$6,606,600), and exports for \$9,605,281 (\$7,396,066).

The decrease in imports was principally in articles of food, raw materials, machines, machinery, and other articles for industrial purposes and for arts and trades, house-

The equivalents in United States currency are stated throughout the article.

hold effects, railway and telegraph articles, tobacco, articles connected with arts, science and belies lettres, coal, shirtings, cotton trouserings, oils and tallow. Imports are divided into fifteen classifications, and in the following table there will be found the values of each in the year 1897:

Articles.	Values in United States currency.	Artioles.	Values in United States currency.
Foods Textiles Raw materials Clothing, jewelry, and articles of personal use Machines, machinery, instruments, and other articles for industries, arts, and trades Household effects Railway and telegraph articles Wines and liquors	10, 020, 564 7, 945, 678 2, 769, 975 7, 050, 593 3, 870, 003 826, 783	Snuff, tobseco, etc	8, 676 838, 548 857, 371 102, 675 4, 148, 510

In exports, as already stated, there was a decrease of \$9,605,281 (\$7,396,066) as compared with 1896. Agricultural products, principally wheat, barley, nuts, hay, and pease, showed a decrease of \$2,309,934 (\$1,778,649). Mineral products, principally nitrate, bar silver, borate of lime, silver ore, copper ore, and copper and silver regulus, showed a falling off to the amount of \$6,160,60 (\$4,743,662); while animal products, principally hides, wool, and hams, showed a decrease of \$549,065 (\$422,779). In the following table are given the principal articles which showed a decrease in 1897 as compared with 1896:

The shipping statistics (Movimiento de la Navegacion) show a slight increase in the tonnage in 1897 as compared with 1896. The figures are as follows:

Inward bound.	Number of vessels.	Tonnage.	Outward bound.	Number of vessels.	Tonnage.
1896	9, 035	10, 110, 448	1896		10, 077, 121
1897	8, 376	10, 374, 670	1897		10, 412, 804

The total value of the transit trade amounted to \$4,788,825 (\$3,687,395), in which Bolivia figures for \$4,583,147 (\$3,529,023), and apropos of Bolivia, the value of the mineral and other products of this country exported through Antofagasta in 1897 is given at \$16,382,143 (\$12,614,250). The items are numerous, but only three reach six figures, and only four, seven figures in value. The former are bismuth, antimony, and quinine. The latter are tin barrilla, bar tin, silver ore, and cluster and bar silver.

The customs revenue in 1897 amounted to \$61,186,315 (\$47,113,462). The duties on imports contributed to the total \$24,717,792 (19,032,700), and those on exports \$36,468,523 (\$28,080,763). The increase in import duties in 1897 as compared with 1896, notwithstanding the fact that the value of imports was smaller in the former than in the latter year, is accounted for by the circumstance that there was a greater decrease in the importation of duty-free goods in 1897, as compared with 1896.

# MINING INDUSTRY.

It is a well-known fact that in the present, as in the past, the object of the Chilean miner is the discovery and extraction of rich ores only, and in this pursuit, he frequently—it may be safely said generally—sacrifices time, labor, and money, while all around him there lie untold millions of wealth which he absolutely deepises for no better reason than the fact that they are contained in ores of low grade. He ignores the fact that the very great abundance of this class of ores would more than compensate for their low grade. This shortsightedness of the Chilean miner is one of the defects, among many others, of his inherited education, and the only remedy for it will be a practical object lesson in the way of proving to him that an abundance of low-grade ores is preferable, generally speaking, to a temptingly rich lode, which may be lost when least expected.

In an interesting communication from Mr. A. Orrego Cortes it is stated that copper ore of 4 to 6 per cent is found in abundance in the neighborhood of Santiago and also in the adjacent provinces. But the deposits are not worked, because no works exist for the reduction of the ore. The same thing happens with the numerous gold deposits existing in the same region. There is abundance of ore of "12,

15, 20, and even 30 and 40 grams per ton," but nobody looks at them, because there is no purchaser for the ore. Mr. Cortes makes special mention of gold deposits at Alhué, belonging to Mr. Mateo Fabres, of a grade of 20 to 30 grams; and of a mine at Lampa yielding 70 grams, but they are not worked, because there are no buyers for the ore. With a view of showing what might be done with a reduction works, Mr. Cortes presents the following calculations of the yield and cost of 100 metric quintals of ore containing 6 per cent of copper, six ten-thousandths of silver, and 10 grams of gold per ton:

Gold, 100 grams, at \$1.82. Silver, 6 kilograms, at 27d. or \$50 per kilogram. Copper, 600 kilograms, at £50 per ton.	\$182.00 300.00 400.00
Total	882.00
The cost of winning the ore, carriage, smelting, and separation of the n given as follows:	netals is
Mining 100 metric quintals.  Carriage to the works.  Smelting and separation.  10 per cent to the smelter.  General expenses and contingencies.	60.00 120.00 88.20
Total Daily profits to the miner	456. 40 425. 60

#### GENERAL DESCRIPTION.

The coast of Chile extends from Arica, in the north, to Cape Horn, in the south, including the semitropical regions of the north and the wet cold regions of the Magellan territory in the south.

The northern provinces are Tarapaca, Antofagasta, and Atacama. Tarapaca is immensely rich in nitrate of soda (saltpeter), borax, salt, and silver. A railroad belonging to an English company starts from Iquique, runs up a zizzag path to the table lands above, turning toward the north, connects with all the principal oficinas (or nitrate factories), and returns to the Pacific coast at Pisagua. Another railroad, starting from Caleta Buena (between Iquique and Pisagua), runs east toward the main line between Pisagua and Iquique. The latter railroad is owned by a Chilean company, and connects the Agua Santa nitrate grounds and factory (which are owned by the same company) with the coast.

The principal ports in this province are Iquique, Pisagua, Caleta Buena, and Junin; the shipments are composed almost entirely of nitrate of soda, iodine, and salt, in large quantities, and silver to a lesser extent.

The factories possess the best and most improved machinery of English and Chilean make; they consume large quantities of coal, some British, but chiefly Australian, brought from Newcastle, New South Wales, by ships of great tonnage, which take coal instead of sand or stone ballast and come to the Chilean coast seeking freights, and are occasionally chartered at Newcastle to load nitrate. When chartered, the freight ranges from 10 to 12 shillings sterling per ton for coal, and for nitrate to Europe from 20 to 33 shillings, according to demand. Very few American ships now visit this province, preference being given to iron or steel bottoms over wood; better freights are given them, marine insurance on cargoes and hulls being lower.

In the province of Antofagasta lies the port of Tocopilla, from which are shipped only nitrate of soda and copper ores. From Taltal similar produce is shipped, and in addition, small quantities of gold and silver.

..... 882.00

Antofagasta, the principal port of the province of the same name, is connected with Bolivia by a railroad belonging to an English company. From this port or open roadstead is shipped to Europe great quantities of silver, which is worked out of the Bolivian mines of Huanchaca, Potosi, Corocoro, Oruro, and Colquechaca; also lead, bismuth, tin, skins of the vicuña and llama, wool and coffee, which are produced east of the Great Cordillera of the Andes, as are quinine bark, coca leaves, etc. There are immense deposits of a fair quality of marble, borax, salt, etc., in the province itself, independent of Bolivia. After Tarapaca, Antofagasta may be classed as the richest mineral province in Chile.

In the Province of Atacama lie the ports of Caldera, Chañaral, and Huasco; from the two former are shipped copper and silver ores in quantities, but not so much as formerly. From Huasco the same class of produce is shipped, and also excellent sweet wines, raisins, delicious fruits, and algarobilla seed, which are exported for tanning purposes. Here lies the dividing line between the rich mineral districts of the north of Chile, which are generally barren deserts, rocky hills, mountains, and sandy plains, and the midland provinces, which are extremely fertile and rich for agricultural purposes and vine products. Although hilly and mountainous from here southward, there are immense broad level valleys between the mountain ranges. Caldera, the principal port of the province of Atacama, is connected with the capital of the province, Copiapo, by a railroad, which was the first constructed in Chile, and was built by an American of the name of Wheelwright, who was also the first to establish a line of steamers on the west coast of South America (1859).

Coquimbo province contains only one good port, of the same name. Exports are: Barley, wheat, hay, beans, wool, copper, hides, raisins, and silver. The business of this province has decreased to a very great extent during the past few years, due to the impossibility of working copper mines with the present low price of copper in Europe. The following are the smallest provinces in Chile, but they are also the richest in all classes of agricultural products: Aconcagua, Valparaiso, Santiago, O'Higgins, Colchagua, Ourico, Talca, Linares, Maule, Nuble, Concepcion, Biobio, Malleco, and Cautin.

A railroad, belonging to the State and recently acquired from an English company, runs from the port of Coquimbo to the capital of the province Serena, and from there in an easterly direction to Vicuña. One branch runs from Serena southward to Ovalle, Combarbala, and Illapel, where it will connect with a trunk line now in course of construction from Calera, on the Valparaiso and Santiago line. There is also a branch from Ovalle to the port of Tongoy, used almost exclusively for carrying coals and provisions to the copper mines, and for taking back copper

ores to the coast for shipment at Tongoy.

Through the provinces of Valparaiso and Aconcagua runs a railroad, starting from the port of Valparaiso, going eastward and in a slight northerly direction to San Felipe, and from there in a southeasterly direction to Los Andes, the terminus. It is there joined by Clark's Transandean Railroad, which crosses the River Aconcagua and climbs the mountains toward the summit of the Grand Cordillera, where a tunnel was begun some years ago, but never finished. The entrance of the tunnel will be in Chilean territory and the exit in the Argentine Republic. About halfway between Los Andes and Valparaiso the railroad takes a sharp turn southward and runs to Santiago, and from there through the grand central valleys, almost midway between the Pacific and the Grand Cordillera, passing southward through thirteen different

provinces, with branches running to the Pacific coast from Curico to Llico (building), from Talca to Constitucion (building), to Concepcion, and to Valdivia. From the latter city, it describes a long curve to La Union. The road from the latter town to Port Montt is surveyed and a line will soon be built. This will be the proposed terminus of the trunk or main line, which when completed will extend from latitude 19° south to about 41° 40′ south, or for a distance of 1,300 miles, without counting the length of any of the branches or small extensions and private lines.

With the exception of the nitrate railroads, nearly all of the railroads in Chile are owned by the Government. The 13 provinces through which the railroads pass are extremely fertile. About half the land is cultivated and produces heavy crops of wheat, barley, hemp seed, potatoes, maize, pumpkins, watermelons, linseed, mustard seed, beans (of 12 to 14 varieties), rich grass and hay, beet roots, and every class of cereal or fruit that can be raised in the middle and northern States

of the United States of America.

The southern province of Arauco, which borders on the Pacific, produces abundant coal, which, although of an inferior quality to American, British, or Australian, is highly combustible, and is almost the only coal consumed on board of the steamers of the South American Company (the Chilean company) and of the Pacific Steam Navigation Company on the coast, and of the Gulf and Lamport & Holt's lines (British), and also of the German line. Twenty per cent more of this Chile coal is used than would be required of Australian, British, or American, to yield a certain power, but it is from 25 to 30 per cent cheaper, and is becoming more in demand yearly. There is a line of railroad running from Lebu, through Coronel, to Concepcion. This belongs to the Arauco Company (British), and serves almost exclusively for coal traffic from the mines to Concepcion, where it is supplied to the State railroads for the southern end of the railroad track. Lines of steamers are constantly running with coal from Coronel, Lebu, and Lota to Valparaiso, to supply the northern end of the trunk and branch lines.

The most southerly provinces of Chile are Valdivia, Llanquihue, and Chiloe, and the territories of Chiloe and Magallanes. From Valdivia south to Magellan Straits are immense forests of trees, producing some very fine lumber, such as roble (Chile oak), pellin, lingue, alerce, laurel, cipres, rauli, lumas, and many other varieties of useful timber. and lingue are used for furniture. When rauli is stained walnut, it is very difficult to distinguish it from real walnut, and it is quite as durable. Cipres (a southern fir) is used for house building in damp places, as it does not decay so quickly as the other woods. Roble and pellin are used for building launches, schooners, etc. Alerce is used for shingles, which are cut 6 feet long by 6 inches and one-half inch thick. This wood resists sun and rain, and is very durable; it is similar in appearance to California redwood, but lighter, and splits clean. Alamo is a Chilean poplar-good, light, clean white wood, used for ceilings of Rauli, matched and grooved, makes excellent flooring. There is enough lumber in Chile to last for many years to come, but the cost of transportation to the ports or rivers is so great, that it is cheaper to import Oregon pine (Douglas fir) from Puget Sound.

From January 1, 1898, the Chilean Government, with a view of protecting native industry, placed a heavy customs duty on planed and matched foreign lumber, including Oregon pine, oak, ash, elm, beech, maple, etc., but fine cabinet woods, such as ebony, rosewood, box, walnut, cedar, and mahogany, come in free of duties (if simply sawed but

not worked up). If by the new duties the Government has to a certain extent protected woodcutters and lumber sawyers, the use of Oregon pine in building has almost ceased, the consequence being that what the people have gained in one way, they have lost in another. They can not purchase Oregon pine excepting at high prices, and as they find it the most convenient for making doors and sashes, few houses are built. Owing to the high price of American white pine and the heavy customs duties, little or none is imported, although formerly all doors and sashes were made of it. Now, the cheaper rauli replaces it.

#### FISH.

The coast of Chile is well provided with abundant fish, the best being lenguado (flatfish), lisa (a species of trout), robalo, eels, bastard herrings, mackerel, sierras, a species of white-fleshed salmon called corbina, and crabs; in the south, oysters, sea urchins, clams, mussels, shrimps, etc. On the coasts of the island of Juan Fernandez, lobsters or crayfish are abundant, and the waters are teeming with "bacalao" (a species of cod). There is one small canning factory at Juan Fernandez, belonging to Carlos Fonck & Co., which cans lobsters and "bacalao." There are two at Calbuco for canning mussels, sea urchins, fish, etc., but the fish canneries are scarcely worthy of the name. A good American cannery could make money with a small but good plant, and canmaking machinery for 1-pound cans. The season for catching lobsters only lasts six months in the year; there is no difficulty in selling.

### FRUIT.

There are canning factories in San Felipe, one at San Bernardo and another in the South. They all can peaches, strawberries, raspberries, grapes, apples, gooseberries, etc. The fruit is sterilized and is excellent, but imperfectly packed. Jams and jellies can not be made to pay, beause the customs duty on fine sugar is so high.

### LIVE STOCK.

This country produces excellent beef, pork, mutton, turkeys, fowls, pigeons, and partridges. The heaviest cattle are brought across the mountain passes from the Argentine Republic, rested and fattened in the rich clover and alfalfa farms at the foot of the mountains, and then slaughtered. Many of the bullocks weigh, in dead clean meat, as much as 1,200 pounds. Sheep are small in the midland provinces, but the flesh is tender, juicy, and well flavored. On the extensive sheep farms adjoining the Straits of Magellan, sheep are large and coarse in flesh, but they are chiefly raised for their wool, tallow, skins, and bones. The central provinces produce the best beef. The beef in the southern provinces is not good, probably due to the almost constant rains and to the cattle feeding on the tender branches of trees and leaves of the The heavy and constant rains may be attributed to the virgin forests and luxuriant vegetation. Hogs are plentiful in all parts of Chile, and are moderately cheap. Fair-class hams and bacon are cured in the South at Valdivia, Osorno, and other places, but they are always smoked, nearly always decay at the bone, and never have the fine flavor to be found in American or English hams and bacon.

There is room here for some expert American meat curer to establish a refrigerating chamber for curing meats. The climate is rather too

warm to cure meats perfectly unless too much salt is used, and that destroys the best flavor of the meat. There should be a canning plant attached to the curing department; with the abundance of meats of all classes produced in the country, a small factory (after the style of the Armour Packing Company, of Kansas City and Chicago, or Libby,

McNeill & Libby's, but on a lesser scale) would pay well.

There would be room for one factory, which could supply all of the northern provinces, which are destitute of grain, grass, or barley to feed animals. The numerous nitrate of soda factories employ many thousands of men, and a small factory would be kept busy curing hams, bacon, preparing canned hams, bacon, tongues, corned beef, sausage, fresh beef and mutton, butter, etc. The impossibility of importing such provisions from the United States, owing to the prohibitive customs dues levied on them since January 1, 1898, makes it practical for an American company to establish a factory which would be very profitable.

#### AGRICULTURE.

Machinery and plows of American manufacture are used by about half the farmers; 25 per cent use English and Belgian implements. The remainder use the same style of implements that were used in Egypt two thousand years ago. A pointed stick of hard wood, with a single shaft stuck in the center, serves as a plow. For harrowing, a heavy beam of hard wood, with the additional weight of the plowman standing on it, is dragged by a yoke of oxen over the rough plowed farms. The reaping is done by hand; the thrashing by forming a deep circle in the open air with straw, similar to the ring of a small circus, driving in from 30 to 50 mares, posting as many men at regular intervals on the outer part of the circle, and by means of shouting, shricking, and lashing driving the animals fast and furiously round and round the circle, thus treading out the wheat from the ears. This is called "la trilla," primitive indeed, but highly satisfactory to the simple farmers who do it, as they make this the occasion for a general feast on the farm, winding up the business of the day with numberless libations of "chicha" (sweet grape cider). On each large farm live a number of "inquilinos," or farm laborers, who are allowed a house to live in, a small piece of ground, sufficient to cultivate enough maize, pumpkins, potatoes, and onions for the use of their families, and where they can keep a few hogs and fowl, grow grapes, oranges, peaches, quinces, etc. Peaches grow almost wild, as do quinces. The valley of the Aconcagua is celebrated for its fine quality of walnuts, honey, wax, potatoes, onions, etc. About 3,000 tons of walnuts are gathered yearly in Chile, 2,000 tons of honey, and 300 tons of wax.

The "papa colorado," or red potato, is grown in quantities not only sufficient to supply all the midland and northern provinces, but to be largely exported to Peru and Ecuador, and sometimes to Panama and

intermediate ports.

The hay grown in the valley is sufficient to supply all the northern provinces and nitrate regions, and to export many thousands of bales to Peru and the Brazils. Shiploads have also been sent to England, but although the freight was comparatively low for such a distance (\$5 American gold), the business did not prove profitable and was discontinued. The same broad valley from Las Vegas to Los Andes is planted for many leagues, as far as the eye can see north and south, with the vines of the black grape, from which is made "chicha" (cider) by boiling, sieving, and fermenting grapes together with the skins. It is esti-

mated that 1,000,000 gallons of good, sound, wholesome dry claret wines could be made yearly from the grape crop of this valley. Don Guillermo Brown (the son of an American named Don Brown, who died some years ago worth \$17,000,000, acquired in Chile through sheer industry and energy) is the proprietor of a large vineyard and produces great quantities of first-class dry claret. It is called "vino escorial de Panquehue," the latter being the name of a village in the vicinity of the estate, near which is also the large estate of Errazuriz (a relative of the President), producing excellent wines similar to those of the Brown estate.

### GRAPE CULTURE.

This is also common, and extends from Huasco to Cauquenes, or about 550 miles north and south. Delicious sweet muscatel wines are made in or near Huasco (north), and semisweet wines are made in Tome and Cauquenes (south). There seems to be no limit to the producing capacity of the soil, which is greatly favored by the facilities offered for irrigation, by the numerous streams of melted snow which can be and are trained in any required direction as they rush toward the Pacific Ocean, fertilizing the lands through which they pass in a constant stream. This of course is applicable only to the central and southern provinces. The northern portion of Atacama, and all of Antofagasta and Tarapaca, are rainless regions.

### REMARKS.

The foregoing general outline, descriptive of the products of Chile, is given to enlighten those American merchants who have but a faint idea of this country, its people and products. Numerous cases have occurred during the last few years in which American merchants have sent, at a heavy loss, consignments of honey, fresh butter, peaches, apples, canned vegetables, cheese, and beans. To dispel the illusion caused through ignorance, it is here necessary to state that all of the above foods can be produced as good and much cheaper than in the United States. Flour, wheat, and barley, in fact all cereals, are in the same category, but with oats jt is different, and it would pay to establish an American plant for the manufacture of rolled oats (on a small scale).

### SUGAR REFINERIES.

There are two sugar refineries in Chile. The largest is Viña del Mar, 6 miles from Valparaiso. It is a Chilean company. The other is in Tome, province of Concepcion, owned by Mauricio Gleisner & Co. Both refine only cane sugar, most of which comes from Peru, but an occasional cargo comes from Java. Both are equipped with the most valuable modern plant known, and, when working at full capacity, could supply the whole of the requirements of Chile. A large factory for the manufacture of sugar from beet roots was erected about ten years ago at Parral (province of Linares), but as the planting of the sugar beet was undertaken by incompetent people, or through mismanagement of the concern, it proved a failure, and the factory and grounds were sold to the Viña del Mar sugar refinery, which keeps it closed, but intends to give it another trial soon.

### LABOR.

Chilean workmen are quick to pick up ideas, if taught by expert mechanics or artisans. They soon learn a trade, and are steady work-

ers, when not addicted to drinking grape cider, beer, wine, or aguardiente. Their teachers or instructors must not become too familiar with them, however, or it would be impossible to teach them. They must be treated in a friendly but firm manner; then, and then only, the average Chilean becomes an excellent workman.

### ENGINEERING AND MACHINE FACTORIES.

There are two well-appointed steam factories in Valparaiso. One is owned by Messrs. Balfour, Lyon & Co., the other by Messrs. Hardie & Co. Both are about equal in steam power and working capacity. The best equipped factory of the kind in Chile is at Caleta Abarca, about 4 miles from Valparaiso. The Baron Engine Shop, in Valparaiso, is capable of doing good and heavy work, as is the Maestranza, of Santiago (the capital); but both the latter belong to the State railroads, and are inferior to the Caleta Abarca works, which has constructed numbers of locomotives, many hundreds of cargo cars, and some passenger cars. With the exception of the wheels, many entire locomotives, including boilers, have been built by Messrs. Lever, Murphy & Co. About 90 per cent of their employees are Chileans, and the remainder foreigners. The same proportion rules in the shops of Balfour, Lyon & Co. and of Hardie & Co., whereas the State shops employ 95 per cent of Chilean workmen.

The Baldwin and Rogers American engines (locomotives) are now and have been for some years running on all the State railroads, and have given great satisfaction; but owing to the outcry of a great number of unemployed Chilean mechanics, engineers, and laborers against the payment of heavy sums of money to foreign countries for engines that could be built in Chile, the Government was compelled to call for proposals for the supply of locomotives, cars, and other engines, giving the preference to those constructed entirely in Chile (excepting the wheels), providing that they did not exceed 10 per cent of the cost of American or European locomotives of the same class and power placed finished on the rails. The probability is that the Chilean Government, in order to furnish work to such great numbers of unemployed Chilean engineers and mechanics, will be compelled to continue this policy. Although the raw material can be imported from the United States for building passenger cars, no good passenger cars have been built in Chile. All of the tram cars are now built in Valparaiso and Santiago.

Most of the raw material being brought from the United States, American passenger-car builders should interest themselves in this matter. The old English style of heavily cushioned, select side, door entrance is gradually giving way to the American cane-seated, endentrance cars, and the much-to-be-deplored hybrid car, of Chilean build, which is neither American, English, or continental pattern, but a mixture of all. Most of the cars now running on the State lines are American. Some few on the Valparaiso and Santiago and the Concepcion and Santiago lines are Pullman saloon cars. They are not owned by the State, but a certain sum over and above the rate fixed by Government is allowed to be charged for a first-class fare. This extra sum is the gross profit for the use of these cars, which were brought here by an American, Colonel Spooner, about twelve years ago. First, second, and third class passengers are carried on the State lines. This arrangement is not only popular, but necessary in this country.

In most of the northern provinces may be found copper-smelting establishments, and in many of them, silver smelters; of the latter, the most extensive and costly is the Playa Blanca establishment, situated

211

about 1 mile north of Antofagasta, and belonging to the Huanchaca Company. This company also owns the Huanchaca mines, including the famous Pulacayo mine, which has for many years produced \$6,000,000 silver yearly. The cost of production was about 50 per cent of that amount. The mine does not now produce nearly so much, because, like the San Miguel de Colquechaca, it is flooded with water. If an American company could be organized to bring out some of the most powerful pumps the world possesses, with electricity as motive power, and pump the mines dry and keep them dry, the business would prove highly remunerative. Steam power is ruinous to all Bolivian mines that are flooded.

Coal cost before the railroad was built about \$400 (Bolivian silver dollars¹) per ton, placed at the Colquechaca mine, and now the freight for hauling the coal from the Pacific coast to the mines is about twice the cost of the coal on the coast. If the electricity were generated by water power, the cable conducting the electric fluid could be run to almost any distance from some of the never-failing mountain streams to the mines. Here is an opportunity for investment that should not be overlooked by American electrical companies and engineers. The installment would, of course, be costly, but in due course of time, after prudent previous investigation by reliable men, backed with abundant capital, and with safe legal contracts with the mining companies and owners of the richest mines, no better business could be found.

#### LIGHTING.

The streets of the cities of Santiago, Valparaiso, San Felipe, Talca, Iquique, and Antofagasta are lighted by coal gas; Santiago and Valparaiso run electric-light plants, but only for private houses and public institutions. A great quantity of paraffine is imported from the United States. It is the principal illuminating material consumed in all the country and many town and city homes. Fifty per cent of the lamps used for paraffine are of American make, and notwithstanding the cheapness of the German article, the American is preferred.

#### MANUFACTORIES.

I have not space to dwell on all of the manufactories of Chile, but will mention a few. In Valparaiso are three coach, cart, and truck makers, who make good, durable vehicles, etc.; three manufacturers of macaroni; four steam planing and lumber dressing factories; about six door and sash makers; three tanneries; one linseed oil factory; one meat-curing house; ten furniture factories; five saddleries, and many small factories for different branches of trade. There are three steam and gas power factories for making boots and shoes; many cheap boots are also made by the prisoners of the city prison. In March, 1898, two English merchants (Messrs. Gibbs and Seddon) purchased a building and ordered machinery from England for the purpose of making boots and shoes on a large scale, using gas as a motive power.

In Santiago (capital) there are many factories run by steam, gas, and water power. Very handsome coaches are built there, and only the most wealthy of the citizens purchase coaches in Europe or the United States. The importation of coaches, buggies, etc., has now, with rare exceptions, ceased, customs duties being excessively high. Furniture of all classes is now made here. In this branch the United States has

<sup>&#</sup>x27;The value of the Bolivian dollar January 1, 1899, was estimated by the United States Director of the Mint at 43.9 cents.

lost a very valuable business, but the tariff affects Europe in the same manner. This Government is determined to protect native industries, by levying an ad valorem duty of 60 per cent upon all articles that can be made in the country, excepting machinery. Prison labor competes with manufacturers in the production of cheap boots and shoes, but for fine boots and shoes there is room for an American power factory (well equipped) in Chile, and the first in the field will be certain to do well. The country produces excellent sole leather, but only rough, badly cured leather for uppers; consequently, leather for uppers, laces, shoe pegs, eyelets, and hooks are imported, the first from France, Germany, and Austria, eyelets and hooks from Belgium and France, woven laces and elastic for side springs from England, and pegs from the United States.

## BREWERIES.

Breweries are numerous in all parts of Chile, and so are mineral water factories. Santiago, Valparaiso, Limache, and Valdivia produce first-class beer of all kinds and extract of malt, which is sold so cheaply that American, English, and German beer was driven out of the market before the present heavy protective duties were put on it. There is no room for foreign capital in this branch of industry.

## LOCAL TRANSPORTATION.

On state railways, the rates are exceedingly cheap; the Government suffers considerable losses every year through hauling goods over the track. The revenue never equals the expenditure; but the theory is

that if the Government loses, the nation gains.

The rivers of Chile are little better than small mountain streams. The Valdivia is navigable by small steamers of 10-foot draft from the mouth to the town of Valdivia (only a few miles). The rivers Imperial, Bueno, and Maule have dangerous bars, upon which small steamers of 10-foot draft are often lost; farther south there are rivers, such as the Palena, which are not frequented, as there is no commerce or industries of any kind in their vicinity—nothing but thick, rank, and apparently impenetrable forests.

## TRADE-MARKS AND MARKS OF ORIGIN.

These are registered at the offices of the Sociedad Fomento Fabril, in Santiago, for a small fee, but the register must be renewed every ten years to remain valid. An infringement or counterfeit of any trade-mark can be punished only by a great expenditure of money and patience. The laws are very lax in meting out punishment to the culpable person who has been denounced or detected in the act of imitating a trademark.

Merchandise of every description may be landed in Chile without being marked with the name of the country of origin.

## PASSPORTS.

Any citizen of any part of the world may travel in any part of Chile without being molested. No passport is ever required, excepting, perhaps, in time of war.

## WHALING.

There are two whaling companies in Chile; one, established at Valparaiso, owns four ships; the manager and all of the captains and

Digitized by GOOGIC

officers are Americans. All barrel provisions, equipments, and implements are brought from the United States. The other company belongs to Chileans, Sres. Fuentes & Co., and owns three ships. The ships make annual cruises to the north, catching most of their whales between Panama and Manta, in Ecuador. They are generally very fortunate; but since American mineral oils have become so cheap, Chilean whaling can not be considered a profitable business.

## SHIPBUILDING.

This does not exist, from an American point of view; a few iron launches are occasionally built at Caleta Abarca. Torpedo boats are brought from Europe and put together there and at Talcahuano. Thousands of launches or lighters ranging from 10 to 50 tons, and once in a while a schooner of from 50 to 100 tons measurement, are built at Maule. Nothing of more importance in this branch is ever done in Chile.

## DOCKS AND WHARVES.

There are two wooden floating docks in Valparaiso; one can take in a steamer of 3,000 tons and the other one of 1,800 tons. There is one mole, or wharf, built on iron cylinders, which can take two steamers of 3,000 tons each on the outside and one on the inside, leaving room inside and out for the discharge of a number of launches. The wharf is fitted with rapid-working hydraulic cranes, which discharge ships' cargoes in short time. Upon the wharf is a huge hydraulic lift, by which guns and boilers of 50 tons weight have been landed. first-class dry dock in Talcahuano, owned by the Government; it is capacious enough to easily admit an ironclad battle ship of 8,000 tons. It can be used by merchant ships in case of need, but the Valparaiso docks are preferable from an economical point of view. Iron and steel ships, boilers, and engines can be repaired or built, if required, at a moderate expenditure—even less than the cost of the same class of work in the United States. This work is done on shore, in the shops owned by the Docks Company. The reason it can be done so cheaply now is due to the depreciated paper currency.

## WAGES.

The daily wage of engineers and mechanics is from \$1.12 to \$1.68, American gold. Launchmen—those who carry cargo and ballast to and from ships and steamers—and ships' laborers are paid on an average from 65 to 80 cents, United States currency, per day; stevedores about 95 cents, United States currency. Food is supplied on board free to the latter and to laborers, but not to launchmen. Farm laborers (inquilinos), when living in free huts and with a free patch of land granted by the estate, receive 12 cents per day, and when employed outside, 25 cents, United States currency. The wages of carpenters, cabinetmakers, coach and cart builders, wheelwrights, painters, masons, bricklayers, blacksmiths, coppersmiths, turners, and saddlers are from 50 cents minimum to \$1.90 maximum, United States currency.

#### CURRENCY.

In the beginning of July, 1898, the legal currency of Chile was gold. The standard peso (or dollar) was fixed at the value of 18d. sterling, or the approximate equivalent of 36 cents American gold. By the law of

February 11, 1895, three gold coins were adopted: The condor (\$20), weighing  $11\frac{9}{20}\frac{9}{7}$  grams; the doublon (\$10), weighing  $5\frac{9}{10}\frac{9}{3}$  grams, and the escudo (\$5), weighing  $2\frac{9}{60}\frac{9}{1}$  grams. All gold coins were eleven twelfths fine. Four silver coins were also adopted: The peso, weighing 20 grams; the 20-cent coin, weighing 4 grams; the 10-cent coin, weighing 2 grams, and the 5-cent coin, weighing 1 gram. All silver coins were eight hundred and thirty-five one-thousandths fine. Gold was coined free of charge; English or Australian pounds sterling were declared legal currency, and were admitted in payment of customs duties at the rate of  $13\frac{1}{3}$  pesos.

By the laws Nos. 277 and 280, of February 11, 1895, it was declared that bank and fiscal notes should be exchanged for gold. This was done and the conversion effected by the Government with about 43,000,000 of gold pesos, each of the value of 18d., or 36½ cents American gold.

each.

The country was making marked progress, until international difficulties (the boundary-limit question with the Argentine Republic) caused bitter discussion by the press and the people of both countries. Chile prepared for war with her neighbors, purchased ships and munitions of war, drilled her national guards, and placed the fortifications defending Valparaiso and Talcahuano in a perfect state of defense, which was effected by mounting a number of the most modern Krupp guns. The total cost of her bellicose preparations has caused the nation, in round numbers, an outlay of about \$36,500,000, American gold. Such an expenditure bore very heavily on a country with 3,000,000 inhabitants more or less. This, and the false and alarming rumors published in the press, that war was inevitable, caused a panic and a consequent rush for gold on the Banco de Chile. The rush lasted two days, when the bank authorities declared to the Government that they could no longer resist the demand, and that if the Government did not assist them, the bank must close its doors. The Government decreed that all banks in Chile could legally remain closed for five days, which was afterwards extended to thirty days, during which time no debts or deposits could be legally recovered. The decree was issued about the 11th of July, 1898. It was the only means of saving the bank, which has a capital of \$40,000,000 (paper), 50 per cent of which is paid up; the balance can be called up, as the shareholders are responsible. It was an act of wisdom to issue the decree, as the bank has branches in many parts of the country, and the suspension of the first banking establishment would have brought suffering and distress to the depositors and shareholders alike. Business was suspended during the thirty days' "moratorium," and little was done in external commerce for one month afterwards. Now, all danger of war with Argentina has seemingly passed. The boundary question has been submitted to arbitration, and the Puna de Atacama limits will be settled to the satisfaction of both countries.

## BANKS.

The Chilean banks established in Valparaiso are: Banco de Chile, capital paid up 20,000,000 pesos, agents in New York, the New York Produce and Exchange Bank; Banco A. Edwards & Co., Banco Comercial, Banco Hipotecario, Banco Mobiliario, Banco Internacional, and Banco de Santiago. The paid-up capital of Edwards, Comercial, Internacional, and Santiago is about 4,000,000 pesos each; the Hipotecario, 50,000 pesos. With the exception of the Hipotecario, all have agents in the United States.

The foreign banks are: The Bank of Tarapaca and London, Limited, capital £500,000 (British), Banco de Chile y Alemania, and the Banco Aleman Transatlantico (German). The foreign banks all have agents in New York.

Thus, there are ten commercial and four mortgage banks established in Valparaiso. The principal ones have branches in the nitrate and wheat-growing districts.

#### UNITED STATES MERCHANTS.

Messrs. W. R. Grace & Co. and Beeche & Co. export, import, and

charter ships and steamers.

The following are not American, but import American goods: Rose, Innes & Co., Rattray & Co., Juan E. Clark, Gunther & Co., Balfour, Lyon & Co., Betteley & Co., Reinaldo Tillmanns, and other dealers in machinery and hardware of less importance.

Of dry goods, the following are the principal importers: W. R. Grace & Co., Beeche & Co., Huth & Co., Graham, Rowe & Co., Duncan Fox & Co., Lange & Co., Onofre, Polanco & Co., Luttersmersk, Winkelhagen

& Co., Sievers & Thiele.

Of drugs and chemicals: Daube & Co., Wiedmaier & Co., E. Eisele, and Griffiths & Co.

Of notions and general goods: Guy S. Morgan.

Any foreign merchant or person may trade in Chile or acquire property in land, buildings, or vessels on the same terms of equality as Chilean citizens; but foreigners who are owners of vessels registered in Chile, in order to enjoy all the privileges accorded to Chilean vessels, must carry the Chilean flag and be entirely subject to Chilean laws. Steamers and sailing vessels of any nation, under any flag, may trade between ports of the Chilean coast, carrying Chilean produce, provided such ports are ports of entry. To call at any by-port special permission is necessary.

## INSURANCE-MARINE, FIRE, AND LIFE.

The "New York Life" and "Equitable Life" are the only American companies; the "Sun Life" is Canadian. The majority of fire offices are British; next in number are Chilean; then come German, French, New Zealand, Swedish, Swiss, etc. Marine insurance can be effected in a dozen merchants' offices, a few of the principal ones being W. R. Grace & Co., Williamson, Balfour & Co., Duncan, Fox & Co., Huth & Co., Vorwerk & Co., Allardyce, Brett & Co.

Insurance rates for cargo to the United States or Europe range from five-eighths per cent to seven-eighths per cent (including war risk); one-

eighth per cent less if war risk is not covered.

## FREIGHTS.

Lumber from south to Valparaiso, lump sum for the ship. Coal from Lota, Coronel, or Lebu to Valparaiso, \$3 currency (\$1.09 gold) per ton of 1,000 kilos (2,204.6 pounds; to Iquique, \$4.50 (\$1.64); to Peruvian ports, \$5 to \$6 (\$1.82-\$2.19). Nitrate to the United States or Europe, in steel or iron bottoms, from 25 to 35 shillings (\$6.07-\$8.50), according to port of delivery and demand for tonnage.

## CREDITS IN BUSINESS.

The custom of some merchants has been to sell their goods payable in thirty days, allowing a discount of 6 per cent, but if cash were paid,

7 per cent; others, with the hope of effecting more sales, extended the time to sixty days and yet allowed 6 per cent discount; German competition was so keen, not only with the merchants of other nationalities but among themselves, that the term was extended to six months, and in some cases to even nine, the seller receiving a promissory note ("pagare") for the value of the goods sold. In houses with small capital, the "pagares" so received were discounted at a bank after being indorsed, money was obtained, and again used by the merchant for the payment of his obligations. By this system the purchaser always insisted on long credits, and they were generally granted. It can easily be understood that the system was vicious; many stores were established with little or no capital and were overstocked with goods on credit, and the natural result was frequent bankruptcies and an almost complete suspension of credit all around. Good buyers can now get the maximum of credit, which is thirty days, with a discount of 6 per cent.

## SHIPMENTS OF MERCHANDISE.

Shipments from the United States to Chile can not be too carefully protected. The draft for value of merchandise and shipping expenses should be drawn payable on presentation, at the bank rate of exchange, for a 90-days' bill of exchange; the invoice and bill of lading (the latter indorsed to the order of the bank) should be sent with the draft to the bank, with instructions to surrender shipping documents only upon payment of the draft. If, however, the American merchant or shipper has a knowledge, through long previous business, that his customer is a person of proved integrity, he may make his draft payable in ninety days after acceptance at the bank rate for a 90-days' bill of exchange.

All cases or packages, boxes, and barrels must be clearly marked and numbered in stenciled letters and figures; near such marks must be placed the gross weight in kilograms. Shippers and merchants must forward to the consignee, and also deliver to the ship or steamer agent at port of shipment, copies of correct consular invoices (forms are supplied at the Chilean consulate at the port of shipment), the original and duplicate being left with the Chilean consul. Such invoices must be stamped and signed by the Chilean consul, who will also stamp and sign all bills of lading and copies, recovering the legal fee for the service. If consular invoices and bills of lading are not viséed by the Chilean consul, a fine will be applied in Chile, and vexatious and costly difficulties will be raised by the authorities at the port of destination on the Chile coast.

## BALLAST.

Saud ballast can be procured at any port in the Republic where required, at a cost of from \$2 to \$3 per ton; stone ballast, \$3.50, currency paper.

## SHIP'S PROVISIONS.

These are plentiful and cheap in ports south of Caldera, but are 25 per cent dearer in Iquique and nitrate ports. Chilean barreled salt beef and pork do not keep well through the Tropics, and are much inferior to American salt provisions. Potatoes, onions, and vegetables are abundant and cheap; Chilean red potatoes have been carried to Germany in a sailing ship, some of them brought back and found to be still good. Eggs are now about 18 cents per dozen; beef, 8 cents per pound; pork, 10 cents; fowls, 47 cents each; milk, 5 cents per quart; salt butter in kits from Port Montt (south), 16 cents per pound; hard ship's crackers,

igitized by C100916

\$3.20 to \$3.80 per 100 pounds; cheese, 64 cents per pound; all the foregoing prices being in United States currency. Sugar, coffee, and tea are dear if bought on shore cleared from the custom-house, but fairly cheap in bond. American rope, tar, resin, canvas, and oil, and British, Belgian, and German wire rope, yellow metal, nails, and oakum can be procured in any size or quantity. Light, dock, mole and pilot, and hospital dues are very moderate, but mooring and tug rates are comparatively high, both in Valparaiso and Iquique.

Water costs from \$2 to \$3 per ton, pumped on board.

## WEATHER.

Ships may moor in Valparaiso with head to the north in perfect safety from August 1 to May 1. The strongest northerly gales are from the end of May to the beginning of July; before or after that time northerly gales have not sufficient force to do damage. Approaching northerly gales are distinctly marked on the day before they begin, by the falling and low barometer, the closeness and heat of the atmosphere, by the clearness of the sky at the horizon in the north, by the dense gathering clouds in the south, and by the outlines of a hill called the Silla del Gobernador, a distance of 70 miles from Valparaiso, appearing distinctly. Ships that are well moored, with two anchors out ahead with 100 fathoms of chain on each, and one anchor astern with 90 fathoms, can and do ride out the gale through a heavy mountainous sea. Storm signals are always hoisted during the norther season in Valparaiso. All the northern ports are safe, as they are not subject to the visitation of dangerous storms.

## LICENSES.

Merchants' licenses to trade are called "patentes" in Chile. Importers' licenses are divided into two classes: First class pays \$2,000, second class \$500. Wholesale dealers in any merchandise, not being importers, pay: First class \$200, second class \$100. All licenses are issued in the months of August and September of each year.

## TELEPHONE, TELEGRAPH, AND POSTAL SERVICE.

There are two telephone companies in Santiago, and the same are established in Valparaiso, the charges per year for service being as follows: \$36.50 for private houses; \$54.75 for stores or offices; and from \$50 to \$75 additional for communication (double line) with Santiago. These prices are in United States currency.

The State telegraph line runs from Iquique (north) to Port Montt and Ancud (south); messages are extremely cheap. Several private lines

run from Valparaiso to Sautiago.

The postal service is very good; newspapers can be sent from any town or place in Chile to any other place in the same country free of postage; all letters not exceeding 15 grams are charged 5 cents for the interior, and 10 cents to any part of the world where Chile has postal communication.

## STEAM COMMUNICATION WITH THE UNITED STATES.

First-class coast steamers of the South American Company (Chilean) and the Pacific Steam Navigation Company (British) carry the mails from Valparaiso to Panama weekly, connecting with steamers leaving Aspinwall for Mexico, New Orleans, Liverpool, San Francisco, Mar-

seilles, and New York. Two lines of steamers (agents, Messrs. W. R. Grace & Co. and Beeche & Co.) run to New York via the Straits of Magellan.

## CUSTOM-HOUSE AND STORES.

These consist of 12 blocks of large, capacious, and solid brick buildings, fireproof and containing all modern improvements, especially the more recently erected ones, which are four stories high, each leaving subterranean basements of great capacity; nearly 1,000,000 tons of merchandise could be packed in them. Rails go to the doors of each separate department, and hydraulic lifts raise the cargo to the different floors. None but employees are now allowed to enter, unless by a special permission. The cargo is lauded on the fiscal wharf by employees of the custom house and by them conducted to the stores. If merchandise is cleared within thirty days from the arrival and entry of the vessel which brought it, no storage is charged, but if it should remain one day beyond that time, 1 per cent is charged on the value. The charge is not increased if the merchandise remains in the stores three years; only 1 per cent is exacted. This system is convenient, as it allows the merchant to sell his goods from samples and then order the clearance of the goods sold, paying duties only upon those cleared. One per cent is but a small charge for warehousing and storage in fireproof buildings for three years. Goods that enter free of duty pay double storage.

## CUSTOM-HOUSE DUTIES.

A complete reform of the tariff took effect on January 1, 1898. In many cases prohibitive duties were applied, with the view of protecting native industries. As the legislators are, in a great majority, lawyers, doctors, and farmers, educated, intelligent, clever people, and well posted on matters connected with their professions, but having little knowledge of commerce, some great errors are apparent in the tariff. For instance, some years ago the specific duty on eigarettes was \$1, currency, per kilogram; to protect native industries, a special law was made raising the duty to \$5; on January 1, 1898, it was again raised to \$9 per kilogram of 2 pounds  $2\frac{3}{4}$  ounces. Such a duty is contra productive, as it leaves room for contraband on a large scale, on a comparatively unprotected coast as is that of Chile.

The following is an extract from the law:

Inasmuch as the National Congress has approved the following project, it will become law and take effect from January 1, 1898:

ART. 1. All products or merchandise coming from foreign countries and intended for consumption or use in Chile will pay customs duties of 25 per cent on the value, with the exception of those goods which pay 60, 35, 15, and 5 per cent, and those that pay specific duties and those that are free.

As a guide to American merchants, I give only those that pay ad valorem duty of 60 per cent and those which pay specific duties, but it must be borne in mind that the valuation on which the 60 per cent duty is applied is sometimes excessively high, being more than the real cost.

The following pay 60 per cent ad valorem: Starch, canary seed; articles of any material which is printed, lithographed, or engraved, with or without embossing (with the exception of printed books, periodicals, or daily papers); articles made of skins, cardboard, paper, tin (excepting tools); coffins, urns, burial caskets; red pepper, aniseed, oats; playing cards; walking canes; hair, human hair or articles made from it; packets of paper or cardboards for sweets, boxes or cases (put up or in pieces); boots and shoes (with the exception of those that are 15 or less

Digitized by GOOGIC

centimeters in sole, and rubber boots or shoes); baskets, coaches, buggies, carts, and wheelbarrows, put up or in pieces (with the exception of wheels and hubs); jerked meat; corsets; beds, spring mattresses; all kinds of canned meats, vegetables, and fruits (excepting salmon and sardines); all kinds of eatables and comestibles; funeral wreaths, crowns, crosses, and artificial flowers; ornaments, cravats, ties, bows of all classes; confectionery, sweets, jams, jellies (excepting medicinal), pickles; brooms, whisks, and brushes (excepting toothbrushes); tickets and labels; macaroni and vermicelli; fruits, dry. preserved in sirup or spirits; crackers and ship's hard bread, hams sirups; blank books, with or without printed impressions; lumber, planed, matched, or turned; broom handles, tool handles, picture frames, masks (except those for bee culture and for fencing); maize, malt for breweries; wood mallets, all classes of molding, furniture of all classes, put up or in pieces; raisins, perfumery, doors and sashes, entire or in pieces; cheese; iron or steel gates for gardens or fences; ready-made clothing; salts of soda, carbonate of soda; sausage and all classes of skin-covered food; sauces of all kinds; tiles, bricks, and pavement material; cornices and house

ornaments; bacon, wax candles, and vinegar.

The following pay specific duties: Oils, pure and impure (excepting pure medical, perfumed, and the oils of gasoline, naphtha, paraffin, petroleum, or kerosene), pay 14 cents (\$0.051) per kilogram; linseed oil, raw or boiled, 20 cents (\$0.073) per kilo; alcohol, spirits of wine, liquors, and spirits, sweetened or unsweetened, including American whisky, pay 15 pesos (\$5.475) per dozen; same as the last, but not bottled, \$1.50 (\$0.547) per liter (1.0567 quarts); alcoholic bitters, \$12 (\$4.38) per dozen; same as last, but not bottled, 20 cents (\$0.073) per liter; sugar, refined, whole or powdered, wet, dry, or damp, \$14.35 (\$5.237) per each 100 kilos (220.46 pounds); white sugar, granulated, ground, wet or dry, \$11.40 (\$4.16) per 100 kilos; impure sugar, concrete (chancaca), wet or dry, \$5.60 (\$2.044) per 100 kilos; coffee, 10 cents (\$0.036) per kilo; ordinary cardboard, 15 cents (\$0.054) per kilo; barley, \$1.50 (\$0.547) per 100 kilos; beer, bottled (about  $1\frac{1}{2}$  pints), \$3 (\$1.095) per dozen; not bottled, 30 cents (\$0.109) per liter; cigars, \$6 (\$2.19) per kilo; cigarettes, including weight of envelopes, but not of the wood or metal cases, \$9 (\$3.285) per kilo; flour, \$2 (\$0.73) per 100 kilos; paper, straw, blotting, and ordinary, 15 cents (\$0.054) per kilo; snuff, \$5 (\$1.825) per kilo; salt, common, or in blocks or pieces, \$2.50 (\$0.912) per 100 kilos; refined or half-refined salt, 10 cents (\$0.036) per kilo; tobacco, in leaf, \$2.60 (\$0.949) per kilo; chopped, \$4 (\$1.46) per kilo; tea, \$1 (\$0.365) per kilo; white or colored wines (including medicinal), bottled, \$12 (\$4.38) per dozen; not bottled, \$1.20 (\$0.438) per liter; mate, or Paraguay tea, 5 cents (\$0.018) per kilo.

Customs duties must all be paid in Chilean gold dollar of 18d. sterling, equivalent to 36½ cents American gold, or in British or Australian pounds sterling. The Chilean tariff is not complete as printed, as many of the valuations contained in it have since been altered by law. At the present time, the Government is contemplating giving the monopoly of tobacco culture and the exclusive right to import and sell tobacco, cigars, and cigarettes for a period of twenty years to a company represented by a Spaniard, Fernando Rioja, who already possesses a factory for the manufacture of tobacco, cigars, and cigarettes by gas power. There are several American-made cigarette machines in Valparaiso. Most of the tobacco used in Chile is grown in the country and is of very inferior quality. The cigarettes would not suit the people of any

other country.

## COMMERCIAL CONDITIONS.

The statistics published in Chile are full and complete, but are generally one year behind. I forward, however, one of the latest books of statistics published, covering 1897, and one of 1896, and also the annual report of the superintendence of customs for the year 1897. The latter embraces all of the important commercial movements in the Republic in 1897. Compared with 1896 and a part of 1898, the half year ending December 31, 1898, will not show such a good result in imports of mer-

chandise as the period of time from 1895 to June 11, 1898.

Owing to the threatened war with Argentina, imported merchandise became dearer, sales were limited, and in certain classes of goods, such as articles of luxury and those which were not absolutely necessary for the well-being of the citizens, no sales could be effected. Imports were decreased or suspended; this was followed by a corresponding diminution in revenue. The export duties on nitrate of soda and iodine, the only products subject to these duties, remained the From this source alone is derived nearly half of the revenue of Chile. The acquisition of the nitrate grounds of Tarapaca made Chile rich and Peru poor.

The prospects in the near future of doing even a moderate business in the importation of foreign merchandise are not brilliant, excepting in the common classes of cotton flannels, osnaburgs, calicoes, and prints. No special preference is given to any particular mark, pattern, weight, or quality. In normal times the dealer visits the merchant, examines his stock, and rarely if ever counts the warp and west of the material. Experience has taught him that he must select what his customer will buy. He runs his hand over the material, pulls it to test the strength, rubs it to find how much starch dressing it contains, and then

purchases what he considers the most salable.

The large importer exposes to view probably 2,000 to 3,000 samples of his wares from many different countries, including the United States. The country that can produce the cheapest and best goods will sell the American cotton flannels are preferred to any other. American twills, sheetings, and calicoes would be preferred (as they are excellent, and most of them are free from starch dressing) but for the price. The difficulty is that they are dearer in relation to quality than are European goods of similar classes. How commerce could be best fostered between the United States and Chile is a difficult problem to solve. The products of both countries are similar in all respects. The same variations in climate exist. Freights are a trifle cheaper from Great Britain and Germany to Chile than from the United States to Chile.

The manufacturers of the United States produce, by perfect laborsaving appliances and ingenious devices, a great variety of good and useful articles which could be consumed in Chile to advantage, but the power of the United States to sell such commodities at cheaper prices than Europe is neutralized by the fact that Chile has placed heavy protective duties upon the very articles that are most easily supplied by the United States and are most needed here. If a commercial treaty could be made, upon a reciprocal basis of, say, the admission by the United States of cheap wool (for carpets), nitrate of soda, iodine, borax, walnuts, and wines, in exchange for concessions on the part of Chile in the admission of furniture, stoves, ranges, paper, etc., something much better might be done.

<sup>&</sup>lt;sup>1</sup> Filed for reference in Bureau of Foreign Commerce, Department of State.

The financial situation of Chile is not bad. The country is indebted to foreign nations £20,000,000 (\$97,330,000). One-sixth of the total revenue is sufficient for the service of the debt.

#### AGRICULTURAL IMPLEMENTS.

The trade in agricultural and harvesting machinery is as yet comparatively small, the principal tools thus far used and sold consisting of plows, harrows, rakes, and cultivators. There is some business to be done in mowers and reapers, but practically no trade in self-binders. The country between Valparaiso and Santiago is largely under irrigation, rendering it difficult to use harvesting machinery. The farming being mostly done in a primitive way, great thistles and weeds are allowed to grow with the grain, which makes machine work very difficult.

Thus far, very few self-binders have been used, and then only in the south, near Concepcion. Quite a number of English thrashers have been sold, but very few of American manufacture. American machinery, however, is gradually gaining, and some manufacturers are wisely sending representatives here to introduce their goods and teach the people how to operate them, which (as I believe), is the only practical way to advance United States trade in those lines in this country. The English manufacturers have had men in the field experimenting for many years, and have built thrashers in accordance with the requirements—heavier and not of such high speed as the American manufactures, of which it is claimed that the speed is so high and the machinery so light that in operating they soon shake to pieces.

## HARDWARE.

The United States is the principal competitor with England in all kinds of mechanical tools. In cut nails, tacks, and shoe nails the Americans can do nearly the whole business, and the preference shown them is attributed by the trade to the superior quality of the materials used in the manufacture. In platform scales, the United States takes the lead, and also does a good business in shovels and articles in which wood enters to any extent.

## IRON.

If properly worked, there would seem to be a good field for the American iron trade in Chile. Almost all bridges here are constructed of iron. Galvanized iron is used to a surprising extent in the central and northern portions. In the absence of available timber, it is used in the construction of buildings, for roofing and fencing, and in a great variety of cases where light but strong and durable material is desired.

## BICYCLES.

These are as yet comparatively but little used in this consular district, except in the neighborhood of Santiago. The demand, however, is slowly increasing, and as the roads become better adapted to their operation, there will probably in the not distant future be a profitable field in Chile for this trade.

## NEED OF UNITED STATES VESSELS.

In every project for the promotion of trade between this and our own country, the question of transportation at once presents itself. As is well known, we have under our flag no seagoing vessels doing business on this

Digitized by GÖÖğle

west coast south of Panama. The opportunities for a line of American steamers between Valparaiso and Puget Sound, touching at way ports, and particularly at San Francisco, Cal., and Portland, Oreg., is worthy of attention. Some system of transportation that will put us on an even footing with the manufacturers of England and Germany, is indispensable to a successful American trade with this southwest coast. If the proposed Nicaragua or some other trans-Isthmian canal were constructed and under American control, the United States would control the commerce of South America.

## INFORMATION.

By each mail arriving from the north, this consulate receives a large number of letters from manufacturers and other business people in the United States, asking information upon a great variety of subjects, some of which require much research in order to answer them intelligently and satisfactorily.

The consul makes it a point invariably to answer all these letters within the earliest time possible, being very anxious to be of service to those manufacturers and others in the United States who desire to extend trade with or to obtain information concerning this country.

JOHN F. CAPLES, Consul.

VALPARAISO, October 26, 1898.

## ANTOFAGASTA.

The intendente of the province has kindly placed in my hands his returns to the Government for the year 1897, covering the commercial and maritime movement. These returns are published in the book Estadística Comercial for each year.

Maritime movement of the Antofagasta consular district from January 1 to December 31, 1897.

The American bark *Portland*, Lloyds, touched at Antofagasta with coals, and an American schooner of 198 tons touched at Tocopilla. These are the only American vessels that have been inside this consular district. Besides imports and exports given, the following must be taken into consideration:

	U. S. gold.
Merchandise, etc., in transit for Bolivia	\$1,750,000
Minerals and mineral products from Bolivia	4, 230, 000

C. C. GREENE, Vice-Consul.

ANTOFAGASTA, June 4, 1898.

## SUPPLEMENTARY REPORT.

No reliable data can be given for the first six months of 1898. Owing to continued depression of silver and nitrate of soda, the volume of importations for this district and in transit for Bolivia has, perhaps, hardly reached that of 1897, though the steamers of W. R. Grace & Co. and Beeche & Co. have come well filled for the coast. The demand for American domestics, worked up mainly by W. R. Grace & Co., in Bolivia, appears to be slowly increasing. The steady demand for copper has given a very considerable impetus to mining, and the possible advance in nitrate of soda has induced people to try to develop a large district about 60 miles southeast from this port.

In connection with copper, I should say that in the southern department of this district mines, formerly worked for gold have developed a

good quality of copper.

<sup>1</sup> In reply to circular of August 5.

As to the question, What can be done to develop and hold trade in this country, I would say that the only methods are those set forth in ex-Consul Connolly's report from Auckland, New Zealand, of July, 1896, and published in January, 1897, issue of Consular Reports (No. 196). I invariably refer my many correspondents to that report, and urge them to study it and learn the things needed.

C. C. GREENE, Consul.

## IQUIQUE.1

The difficulties in obtaining official statistics of imports and exports are almost insurmountable, particularly for the first six months of a year. Official compilations cover the calendar year and are not made up in this port, but in Valparaiso. Statistics of the exportation of iodine and nitrate of soda, however, can be obtained at any time from the Asociación de Propaganda, of this city, and I am indebted to the courtesy of Mr. E. Vijil, the manager of the association, for many of the details given below.

#### IODINE AND NITRATE OF SODA.

The exports of iodine and nitrate from this consular district during the first six months of 1897 and 1898 were as follows:

i	Iod	ine.	Nitrate.	
Exported to—	January to	January to	January to	January to
	June, 1897.	June, 1898.	June, 1897.	June, 1898.
United States	Pounds.	Pounds.	Tons.	Tons.
	158, 837	186, 141	39, 409	66, 079
	171, 474, 469	289, 145, 962	242, 038	284, 896
Total	171, 633, 306	289, 332, 103	281, 447	350, 978

Tons of 2,240 pounds.

These figures show that the increase in the shipments of iodine during the first six months of 1898, as compared with the corresponding period of 1897, was about 25 per cent, and of nitrate of soda, about 60

per cent.

As explained in a former report on soda nitrate, the manufacturers of nitrate in 1884 found it necessary to form a combination for the purpose of limiting the production of the article, in order to raise its price, which had fallen below the cost of production on account of the great excess of the output over the demand. The combination was absolutely necessary to save the industry from ruin. The first combination dated from August 1, 1884, and limited the production to 10,000,000 Spanish quintals (of 101.61 pounds) per annum, the production in 1883 having been nearly 13,000,000 quintals. This period was extended to March, 1886, and subsequently to December 31 of the same year. After the rupture of the combination on this date, the output during the four subsequent years was largely increased, and to such an extent as to cause well-grounded apprehension of ruin, unless efficient measures were adopted to limit the production to an amount which would again place the industry on a safe basis.

The second combination lasted from January 1, 1891, until December

In reply to circular of August 5.

<sup>&</sup>lt;sup>2</sup> See Consular Reports No. 68, September, 1886,

31, 1892; the third combination from January 1, 1893, until March 31, 1894, and after an interval of two years, the fourth and last combination was formed, which lasted from April 1, 1896, until October 16, 1897. The limit of the production during the last combination was 23,500,000 quintals, for during the interval of twelve years since the formation of the first one, many new plants had been established, and their total productive power had been immensely increased.

The necessity of forming another combination is admitted by all of the salitreros. The preliminary steps have been taken to determine an equitable quota for each manufacturer, in view of the varied conditions and capacities of different centers of production, and it is expected that within a short time, conflicting interests will be adjusted to the satisfaction of all parties concerned, and that the new combination will secure better and more durable results to the nitrate industry than former ones.

The only course open to the salitreros, they say, is an active, wellorganized propaganda, to which the Government of Chile, as a directly interested party, should contribute liberally. The present subsidy of

£20,000 yearly is inadequate to secure the desired results.

In the opinion of the general agent of the Government in Europe, the amount expended in propaganda will be recuperated one hundredfold. He is satisfied that nitrate has an immense field for its employment, even in countries where it is now consumed on a large scale; that constant and well-directed efforts should be made to find new markets for its introduction. Not only should pamphlets be written and freely distributed, setting forth in plain language the merits of nitrate and its advantages over other fertilizers, a plan already adopted with good results, but the agents of the propaganda should give practical lessons to farmers as to the mode of employing nitrate for different classes of crops and on grounds of varied composition.

The great value of nitrate as a fertilizer in the case of beet root is already recognized, as also for wheat. Experiments on a large scale show that crops of this cereal have been increased threefold by the

judicious use of nitrate.

Cotton plantations in the Southern States afford an extensive field for the application of this fertilizer.

## IMPORTATIONS FROM THE UNITED STATES.

Statistics showing the amount of imports from the United States and other countries I have not been able to obtain. There is no doubt, however, that, owing to increased facilities of transportation furnished by the Merchants' Line of steamers, which ply between New York and the west coast, importations of American goods have steadily increased. These steamers take return cargoes of sugar from Guayaquil, nitrate from this province, and hides and wool from the south of Chile.

The development of our trade with the United States via Panama is seriously hampered by the defective transportation facilities encountered on the isthmus. Complaints are made of damage to goods, in consequence of careless handling. Delay in forwarding goods after their arrival in Colon, and the heavy expenses on the isthmus, increase the

causes of discontent.

American hardware, stoves, sewing machines, and washing machines have an extensive sale, and their superior quality is justly recognized.

American furniture, on account of the good taste exhibited in its make-up, its strength, combined with lightness, and its high finish, has a ready acceptance in this market.

Some samples of gaiters and shoes for men's and women's wear were received from the United States about a year ago. In quality of material, workmanship, and finish they were superior to any goods of their

class in the market, and the price was satisfactory.

The style, as regards the height of the instep and the shape of the toe, was not adapted to this market. An order was given for a good assortment of boots and shoes, with very minute specifications as to the details referred to, so as to meet the requirements of the market. In due time the goods were received. They still remain in the merchant's warehouse, unsold and unsalable. The specific directions given in the order had been entirely disregarded. I myself saw the careful instructions as to the details of manufacture, and I have seen and examined the goods received, and am convinced that no effort was made to satisfy the terms of the order. Indifference to the clearly expressed wishes of the purchaser is unpardonable, and the policy suicidal.

## PACKING OF GOODS.

In my report on this subject in November, 1893, I referred to some instances of bad packing which had fallen under my observation, but I stated that during the previous fifteen years, the improvement in the mode of packing on the part of our shippers was worthy of note. I now regret to say that my attention has been called to so many instances of bad packing during the last five years, that my opinion as to the merits of our shippers in this respect has undergone a radical change. Typewriters, for instance, have been seriously injured by nails carelessly driven, where screws should have been employed. A number of paintings on glass recently received from New York were utterly ruined through faulty packing. In this instance, the case was made of thin boards, and was much too large for the contents. Two transverse cleats had been tacked on the inside of the case to hold the contents down, but some of the nails passed to one side of the cleat and did not hold; moreover, the vacant space was left unfilled by straw or paper. As a natural consequence, the cleats gave way when the box was turned upside down, and not a plate of glass escaped.

These are two instances out of many. Our shippers should regard packing as too important a matter to be intrusted to careless and

incompetent hands.

## CREDITS.

Local accounts are settled on the 10th of each month. In the case of merchandise ordered from the United States, it is customary to have the goods consigned to a bank here, payment being made in 90 days' sterling drafts, on receipt of bill of lading or of the goods, according to agreement. Credits of twelve months are often given by the English, French, and Germans, and this may help to explain the supremacy of the English and German trade in this country.

Theoretically, long credits are objectionable. In practice, where the system of credits prevails, the volume of trade increases. All foreign

accounts are settled by sterling bank drafts at 90 days' sight.

## HARBOR FACILITIES.

The port of Iquique is an open roadstead. The ocean currents are from the south, as are also the prevailing trade winds. Surf days may

occur at any season of the year. During the twelve months ended December 31, 1897, deducting fifty-two Sundays and thirteen feast days, there remained three hundred working days, of which thirty-five were surf days, on which work in the bay was suspended, leaving the remaining two hundred and sixty-five days free for traffic. This may be taken as a fair average of the state of the bay from year to year.

About two years ago, the Government authorized an expenditure of \$100,000 for the construction of a breakwater and darsena. The work has been completed, but at a cost of \$1,200,000, or \$800,000 more than the decree authorized. The number of surf days will doubtless be very much diminished, and traffic in the bay correspondingly ameliorated.

## TELEGRAPH AND CABLE SERVICE.

The Government land line is in operation from one extremity of the Republic to the other. Previous to the 1st of August, the rate was 2

cents currency per word; it is now 4 cents.

The Central and South American Telegraph Company (Galveston line) and the West Coast of America line have stations in this city. Both lines are well served. Their tariffs are the same, and are based on United States gold at 50 pence to the dollar.

## TRANSPORTATION FACILITIES.

Interior transportation is by rail from this city to Pisagua and the intermediate nitrate establishments.

The steamers of the South American Steamship Company run from Lota, in the south, to Panama, as also those of the Pacific Steam Navigation Company. Steamers of this last company run also from Valparaiso to Liverpool, by the Straits of Magellan.

Steamers of the Kosmos Line, from Hamburg to Guayaquil, touch at

this and other principal ports on the west coast twice each mouth.

## COMMERCIAL TRAVELERS, LAWS, ETC.

Commercial travelers are free to carry on their business without

taking out a license or paying a tax.

There are no laws or regulations of a discriminating character which affect American vessels or American trade. There is no law in Chile requiring goods to be marked so as to show the country of origin or manufacture.

No changes have been made in patent, copyright, or trade-mark laws, or in postal rates.

## CONSULAR INVOICES, MANIFESTS, AND BILLS OF LADING.

In accordance with the provisions of the law enacted on the 25th of January, 1898, it is provided:

1. Bills of lading of vessels arriving at porte of the Republic shall be viséed by the consuls of Chile in the ports of departure.

2. On their presentation at the custom-house, manifests shall be accompanied by invoices of the goods in detail, with the visés of the respective Chilean consuls, or if there be no Chilean consul, with that of the consul of a friendly nation.

3. The omission of the visé of the consul shall, in the case of either of the documents referred to, be subject to a fine of triple the amount of the consular fee for

said service.

## COTTON TEXTILES.

The demand in this market for cotton textiles covers those of all qualities from the poorest to the best, and of all widths from 60 to 85 centimeters (23.62 to 33.46 inches). Those sheetings and drills are most acceptable (other things being equal) which contain the least amount of sizing, as exhibiting more honestly the true character of the material. The duty is rated according to the count. When the number of picks to the inch (the sum of the warp and woof) is 20 or under, the duty is \$1.50 per kilo; when more than 20, it is \$3 per kilo.

The varieties are so great that it is impossible to state accurately the number of yards to the pound. I have seen a piece of white cotton of ordinary quality, 78 centimeters (30.7 inches) wide, warp 13 picks, woof 13, which gave 63 yards to the pound; another, of very superior quality, 85 centimeters (33.46 inches) wide, warp 18, woof 16, gave 4 yards to

the pound.

## DUTIES ON IMPORTS.

There have been a number of changes in the Chilean tariff this year, of a few of which only I am cognizant. I now call attention to a few articles which are more heavily taxed than under the former tariff:

The present tariff, decidedly protective, is in the case of certain lines of goods prohibitory, very heavy duties in many cases being affixed to articles which can not be manufactured in the country, either for want of the proper material or of trained labor capable of producing the article in demand.

Champagne, formerly paid \$5.25 (\$1.88) on a dozen, and now \$15

(\$5.475).

Oars for launches paid formerly 15 per cent on \$1 (\$0.385) each, and

now 15 per cent on \$2.40 (\$0.876).

Duties on cigars (Havana and others) were formerly \$3 (\$1.095) per kilo, and they are now \$6 (\$2.19). Duties on cigarettes \$1 (\$0.365) per kilo, as against \$9 (\$3.280) at present. Duties on cut leaf tobacco have risen from \$1 (\$0.365) to \$4 (\$1.46) per kilo.

Duties on meat extracts have risen from 25 per cent on \$1.50 (\$0.547) per kilo\* to 60 per cent on \$3 (\$1.095) per kilo. On ship biscuit, from 35 per cent on \$6.50 (\$2.37) per Spanish quintal to 60 per cent on \$32

(\$11.68) per Spanish quintal.

Duties on gaiters and shoes, from 35 per cent on \$48 (\$17.52) per dozen to 60 per cent on \$96 (\$35.04), and on shoes of the finest class from 35 per cent on \$96 (\$35.04) to 60 per cent on \$192 (\$69.08) per dozen.

On common top boots, from 35 per cent on \$48 (\$17.52) to 60 per cent on \$160 (\$58.40), and on the finest quality, from 35 per cent on \$96 (\$35.04) to 60 per cent on \$320 (\$116.80) per dozen.

All ready-made goods, such as shirts, suits of clothes, etc., formerly

paid 35 per cent and now 60 per cent.

All duties on imports are now paid in Chilean gold of 18 pence to the dollar, and this gold must be bought in the market. The premium at present is from 30 to 35 per cent over paper.

## CURRENCY.

Without tracing the fluctuations in exchange since the resumption of the gold standard on the 1st of June, 1895, it is sufficient for my present purpose to say that on that date, it was  $17\frac{7}{16}$  pence to the

dollar, and that during the three following years until June, 1898, it was maintained at an average of a little under 17½ pence, with but slight variations. Since the month of July of this year, exchange has fallen to between 13 and 13½ pence, having for a few days reached 12½ and 12.

The gold coined under the provisions of the redemption act has had a very limited circulation, the principal part of that actually issued having been shipped abroad or hoarded. The gold dollar is worth 18 pence; the silver dollar, originally worth 17g pence, is to-day, on account of the depreciation in the value of silver, worth less than 16 pence, and the paper currency has not risen above 17½ pence. With sterling exchange below 17¾ pence, it is more profitable to ship coin than to buy drafts. Both gold and silver, therefore, have completely disappeared from circulation.

As duties on imports must all be paid in Chilean gold, the Government, with a view of restraining the exportation of gold, orders weekly auction sales of the coin in the principal business centers of the Republic. The last sales effected in this city were at 334 per cent pre-

miūm.

In the month of July last, such was the financial condition of the country, particularly in the relation of the Government to the banks, that Congress passed a movatory law, to remain in force for a period of thirty days, by which the banks were authorized to suspend at their discretion, in whole or in part, the payment of the checks of their depositors, and were exonerated during that period from their other

financial obligations.

The law also relieved the debtor class from the execution of suits at law or demands for debts during the said period. A small percentage of deposits in account current could be withdrawn daily. Such was the stringency of the money market that business became almost completely paralyzed for want of notes of the smaller denominations, so that recurrence was had to the issue of notes of one, two, five, and ten dollars, payable to bearer on presentation, when the banks should resume their normal operations. These notes were issued by 10 or 12 of the most responsible houses of this city, without any guaranty other than the good faith of the issuers.

On the notes first issued, it was stipulated that they should be redeemed at the rate of 17½ pence to the dollar, which was the rate of exchange at the time; exchange began to fall, and these shinplasters were soon worth 4 pence more than Government bank notes, which left a handsome profit for speculators, as the notes were all redeemed on presentation. In subsequent issues, no mention was made of the rate of exchange. It is calculated that about \$500,000 were issued, of

which a large number still remain in circulation.

The establishment of American banks in this city and in other large cities on the coast would doubtless contribute largely to the extension of trade with the United States, by facilitating commercial transactions.

### MONEY-ORDER SYSTEM AND PARCEL POST.

The inauguration of an international money-order system and parcel post with this country is imperatively demanded, and it should be based, if possible, on a fixed rate of exchange, as in the case of postal rates now established between the United States and Chile. It can not be doubted that the establishment of these two systems would be enthusiastically received by the people of both countries, and that it would also promote the interests of both governments.

J. W. MERRIAM, Consul.

## DECLARED EXPORTS, CHILE.

Value of exports declared for the United States at the several consular districts in Chile during the year ended June 30, 1898.

## COLOMBIA.

## BARRANQUILLA.

In compliance with instructions contained in Department circular dated August 5, 1898, I submit the following report of the commerce and industries of this consular district for the year ended June 30, 1898.

and industries of this consular district for the year ended June 30, 1898. In the preparation of the tables showing the exports and imports and the movement of shipping in this port, I was compelled to resort to the original entries on the monthly sheets kept at the custom-house, to which records I have been granted access by the customs officials, whose courtesy I am pleased to acknowledge.

General reports of the imports and exports and of the shipping are not compiled by the Colombian Government oftener than once in two years. The last report was for the two years ended December 31,1896. It has not yet been published.

Such reports, even when recent, would not be proper subject matter for this review, as they pay no attention to the articles exported to

Colombia by the respective countries.

I believe it to be of prime importance that United States producers and manufacturers, in addition to being advised as to the articles imported here should be informed as to the countries furnishing same. In other words, American exporters should know who are their competitors in each particular line, and I have therefore prepared a report of the chief items of import, with the total value, from the respective countries, for the year covered by this report.

The commercial importance of this city and consular district is indicated by the figures given, figures which also disclose a fact greatly to be deprecated, that in the shipping and in traffic of this port, the

United States occupies so unimportant a place.

Of the 245 steamers entered during the year, with a tonnage of 463,117, bringing cargo amounting to 33,883 tons, not one carried the Stars and Stripes, and but 5 of the 21 sailing vessels, which entered during the same period, were American. Of the total imports, it will be observed that the United States is credited with 16.67 per cent, while England enjoys 35.39, France 21.62, Germany 19.02, and the remaining 7.30 per cent is distributed to Spain, Italy, Belgium, Colon, Holland, Switzerland, and Austria. While Colon is a free port, so far as national duties are concerned, nevertheless, merchandise entered there must pay a provincial duty of 10 per cent ad valorem.

In the matter of exports from this port, the tables are slightly reversed. Of the exports the United States purchased 27.56 per cent, France 22.22, Germany 14.07, and England 35.34. The remaining 0.81 per cent is distributed to Belgium, Costa Rica, Holland, Italy, Mexico, Nicaragua, Spain, and Venezuela. These figures, especially those relating to imports, become the more striking when we consider the great advantage which the United States possesses by reason of proximity to this

coast.

Compared with the report for the preceding year, made by my predecessor, the total imports show an increase of \$2,968,380.94, or 44.49 per cent. In this increase, the United States has not quite held her previous place. During the year ended June 30, 1897, the United States furnished 17.04 per cent of the total imports, and occupied the third place among the countries exporting to this market. During the year ended June 30, 1898, the United States furnished only 16.67 per cent of the imports, and yielded her former place to Germany, a keen competitor for this market.

For the six months ended June 30, 1897, the importations were as follows:

Countries.	Value.	Countries.	Value.
Great Britain	1, 004, 396, 39 789, 578, 99	Holland Belgium	\$55, 983, 50 39, 601, 00 8, 853, 00
Germany	740, 024, 32 135, 298, 40	Total	4, 463, 379. 41

For the six months ended December 31, 1897, the record of imports stands as follows:

Countries.	Packages.	Kilograms.	Value, United States gold.
England France Germany United States Spain Italy Colon (free port of Colombia) Belgium Holland Austria	44, 201 80, 775 147, 637 34, 582 10, 301 196 95	6, 228, 668 2, 229, 091 4, 935, 831 8, 213, 259 1, 148, 497 484, 497 13, 373 11, 500 2, 886 1, 137	\$2, 224, 422, 67 1, 263, 455, 43 1, 213, 320, 69 911, 590, 93 201, 296, 94 105, 043, 42 9, 642, 00 3, 404, 00 1, 300, 00 870, 00
Total	299, 356	23, 268, 709	5, 934, 845. 10

For the six months ending June 30, 1898, the record of imports is as follows:

Countries.	Packages.	Kilograms.	Value, United States gold.
England France United States Germany Spain Italy Belgium Colon Holland Switzerland	31, 234 105, 571 54, 883 22, 079 5, 002 2, 168 413 84	5, 157, 048 1, 602, 693 9, 091, 173 2, 832, 688 725, 284 261, 548 127, 508 5, 508 1, 005 1, 838	\$1, 187, 691. 40 821, 264. 91 696, 172. 87 620, 543. 14 218, 850. 43 109, 762. 29 45, 110. 50 4, 174. 70 680. 00 440. 00
Total	315, 655	19, 806, 293	3, 704, 690. 24

It will be noticed that the imports for the last six months of the year reported were only \$3,704,690.24, as against \$5,934,335.10 during the preceding six months.

The great difference in the value of imports for the two periods may be partly attributed to the high rate of exchange, due to a variety of causes, but I am told by dealers that it was largely owing to an overstocked market, the result of the heavy importations during the six months ended December 31, 1897.

The exports for the six months ended June 30, 1898, were \$4,697,616.47, as against \$4,961,519.14 for the preceding six months. This was probably due to irregularity of the coffee shipments and to the downward tendency of the foreign market for this important commodity.

## THE CITY OF BARRANQUILLA.

Barranquilla is a thriving commercial city, with a population estimated at 40,000. Its site is a slightly sloping plain, on the western bank and near the mouth of the Magdalena River, in latitude 10° 59′ north and about 74° 25′ west. This important stream is the great internal highway for Colombian commerce, rising in the borders of the departments of Tolima and Cauca, and receiving, in its course of about 1,100 miles, the waters of many noble rivers, passing seven of the nine departments of the Republic, and bearing the rich and varied products of the land. Barranquilla is the central point for Colombian exports and imports. The city is laid out in a fairly regular manner. Its

streets are somewhat wider than those of the average Spanish city. In the residence portion, known as the "Quintas," are many beautiful homes, with attractive gardens, costing from \$20,000 to \$30,000, while in the business portion of the city there are many large and substantial buildings. There are a few fine wooden houses, but most of the better class are of brick, with tile roofs. The walls of the cheaper houses are made of clay or mortar, supported by a framework of split guadua (native cane). Such houses, when well built, plastered, and whitewashed, present a neat appearance, and are cool and durable. They are thatched with rushes, a kind of roofing which, in addition to being very serviceable, is almost incombustible. During a residence of more than a year in this city, I have not known of the destruction of a single building by fire.

In the internal furnishing of many of the homes, rich and costly articles are seen. Pianos, handsome mirrors and chandeliers, principally from Germany and France, find a ready sale here, while the choice array of porcelains, glassware, dry goods, and notions exhibited in many of the stores evidences the fact that this city is a market not only for low-priced goods, an enormous quantity of which are imported, but for the better and higher-priced wares of Europe and the United The city has a street railway system with fifteen cars, drawn by mules, and the service is fairly good. The fare charged is 5 centavos, equal to about 1½ cents United States gold. During the year 1898, 1,066,000 passengers were carried. The city is supplied with water from the Magdalena River by the "acueducto de Barranquilla," with 926 subscribers, from whom the company collects monthly some 4,612 pesos, equal to about \$1,429.72 United States gold. All drinking and cooking water should be filtered, and when so treated no better could be desired. The water filter has its place in almost every house, not only here, but in the cities and towns along the river's course. Many stone filters have been imported. They are heavy, cumbersome affairs, and owing to the great percentage of loss from breakage, are rather expensive. They retail at about 17 pesos, equal to \$5.27 United States gold.

There are electric-light plants in Barranquilla and Santa Marta. The Barranquilla plant has 1,120 lights of different candlepower, from 8 to 50, in use. The rate charged is 2 pesos, or 62 cents United States gold, per month, for lights of 8 candlepower. Barranquilla and Santa Marta have public telephone exchanges. The Barranquilla exchange has 278 subscribers; charge per month, 6 pesos, equal to \$1.86 United States gold. Public coaches are licensed, and the charges are regulated by the municipality; there are 73 in the city. Each coachman is required to keep the tariff of charges posted in his carriage. It costs but 20 centavos, equal to about 63 cents United States gold, to go from one part of the city to another. There is little difference in the styles of public coaches in use. They are two-seated covered carriages, so arranged that the back can be turned to the front seat. During the year reported, most of the carriages came from the United States, some from France, a few from England, and one from Italy. the carriages used here are of American make. The two-seated ones cost in the United States from \$225 to \$400. The retail price given me by a dealer here, on a two-seated carriage costing \$307.50 in the United States, was \$1,184.30 Colombian currency, equal at the time to about \$370 United States gold. The private conveyance used is almost invariably a one-seated, four-wheeled carriage of the phaeton style, with seat arranged on dash for driver, and is drawn by one horse. These are bought in the United States at from \$200 to \$300 gold. They cost laid down here from 800 to 1,000 pesos, according to exchange. English and French makes go principally to the interior. Buggies and cabs are never seen. All freight and merchandise is transferred in the city on carts drawn by mules. An American wagon or dray would be a curiosity here. It must be remembered, however, that there are practically no country roads, and the streets in some portions of the city are quite sandy in the dry season, and perhaps, the carts with these broad tires are best adapted to conditions here. The city is policed by 86 uniformed officers. Little drunkenness is seen in the streets, although great quantities of domestic rum and imported wines, liquors, and beer are consumed. There are three Catholic churches and one Protestant mission.

## HARBOR FACILITIES.

Owing to the dangerous navigation at the mouth of the river, no ocean steamers and but few sailing vessels come to Barranquilla. Although the name of Sabanilla, the former post (now entirely abandoned), is erroneously retained on many of the charts of this coast and continues to be used by the shipping, the actual seaport is Puerto Colombia, a distance of 172 miles from this city and connected with it by railroad. At Puerto Colombia is a fine steel-pile pier, about 4,000 feet long, extending into 26 feet of water, with accommodations for five ocean steamers. The pier and railroad are operated by the Barranquilla Railway and Pier Company, which, although an English corporation, has purchased much of its rolling stock in the United States, and has recently bought there two fine new Baldwin locomotives, two passenger cars, and several freight cars, made by Jackson & Sharp, of Wilmington, Del. The road is 3-feet 6-inch gauge, and furnished with 60-pound steel rails (English and American), laid on creosoted ties from the United States. During the year ended December 31, 1898, the company handled 61,917 tons of freight and carried 59,468 passengers. Freight rates are charged by this company according to class of merchandise. The unit of measure is a "carga," which is one-eighth of a ton. In computing bulk freight, a cubic meter, 40 feet, is treated as a ton. Import freight is divided into four classes, numbered fourth, fifth, sixth, and seventh. The fourth class pays 7.04 pesos, equal to about \$2.18 United States gold, and includes hardware, boots and shoes, hats and caps, furniture, dry goods and notions, drugs and medicines, wines, liquors, and beer, groceries and canned goods, glassware, machinery, and turpentine; for the latter, 50 per cent is added. The fifth class pays 4.56 pesos, equal to about \$1.38 United States gold, per ton. and includes rice, sugar, flour and meal, onions, beans, lard, ice, apples fresh or dried, potatoes, salt, iron, steel, and lead in bars and sheets, pipe or pig, copper and tin sheets, pans and plates, steel rails, chains, wire rope, anchors, boiler tubes, and asbestus. The sixth class pays 3.36 pesos, equal to about \$1.04 United States gold, per ton, and includes stearic acid and stearin, barbed wire, tiles, tow, iron kettles, coal, cement, rosin, galvanized or corrugated iron, sheet or other iron roofing, brick, zinc in sheets, porcelain crockery, lumber, mosaics, wicks, grindstones, filters, caustic soda, raw tallow, empty bags, bagging, woven wire, and raw materials for making glass or crockery. The seventh class pays 13.60 pesos, equal to about \$3.21 United States gold, per ton, and includes acids, alcohol. loaded cartridges, gun caps, miners' fuse, dynamite, powder, and other explosives. The minimum freight charge is one peso.

Export freight is divided into sixteen classes, for which the charges are as follows:

Class.	Pesos.	Class.	Pesos.
	2. 60 3. 00 4. 00 4. 40 5. 00 5. 20 5. 60 6. 40	9per ton. 10do. 11do 12do 13do 14do 15 (eattle and horses)per head. 16 (hogs, goats, sheep, dogs, etc.) .do.	6. 43 6. 86 7. 06 8. 06 8. 44 10. 06 2. 16 1. 25

This is the paper peso, worth about 31 cents United States gold. Its value fluctuates. These freight charges include, for import cargo, the handling of freight from the vessel to the custom-house at Barranquilla, and for export freight, delivery from Barranquilla on board the vessel.

## CUSTOMS DUTIES.

By the provisions of the tariff laws now in force, imports are divided into sixteen classes. The rate of duty levied upon any article depends upon the class to which it belongs. There are no ad valorem duties. In the following table, the several classes are given, with rate levied for each, together with some of the more important articles included in the respective classes.

These rates are charged upon the gross weight of the package, and, like all other Government charges, are payable in Colombian paper currency at its face value.

No.	Articles included in the respective classes.	Rate per kilo a in Colombian currency.	Equiva- lent in United States gold.
1	Railway materials, bridges, tiles, bricks, and paving stones, buildings in pieces.	Free	Cents.
2	Potatoes, rice, corn, barbed wire, etc	1 centavo plus 20 per cent plus 25 per cent.	0. <b>46</b>
3	Wine, crockery, bottles, agricultural implements, etc	2½ centavos plus 20 per cent plus 25 per cent.	1. 16
4	Flour, sugar, beer, cornstarch, tapioca, blasting powder and dynamite, carriages.	5 centavos plus 20 per cent plus 25 per cent.	2. 32
5	Kerosene oil, wicks, ink, harness, scales, pianos, chemi- cal supplies.	10 centavos plus 20 per cent plus 25 per cent.	4. 49
6	Hams, confectionery, pickles, canned goods, tools, tallow candles, butter.	20 centavos plus 20 per cent plus 25 per cent.	8. 99
7	Medicines, ciunamon, hemp cloth, leather, furniture	30 centavos plus 20 per cent plus 25 per cent.	12. <b>4</b> 8
8	Spirits, brandy, whisky, linen cloth, cutlery	40 centavos plus 20 per cent plus 25 per cent.	17. 98
9	Cotton linings, wool blankets	50 centavos plus 20 per cent plus 25 per cent.	22.47
10	Wool thread, sporting powder, wax matches, drills	60 centavos plus 20 per cent plus 25 per cent.	26. 35
11	Tea, cotton bedspreads, wool carpets, fireworks	70 centavos plus 20 per cent plus 25 per cent.	31.46
12	Cotton handkerchiefs, ribbons, rubber shoes	80 centavos plus 20 per cent plus 25 per cent.	35, 96
13	Underwear, cotton ready-made clothing	90 centavos plus 20 per cent plus 25 per cent.	40.45
14	Linen ready-made clothing, wool cloth, shoes	1 peso plus 50 per cent plus 25 per cent.	54. 25
15	Embroideries, lace, wool clothing, saffron	1.20 percent. 1.20 percent plus 25 per cent.	65. 10
16	Silks, perfumery, gold or silver brocade, firearms (except shotguns), jewelry and precious stones.	3 pesos plus 25 per cent.	\$1.16

#### SPECIAL DUTIES.

On salt, 1.20 pesos (53.8 cents) each 124 kilos (26.45 pounds). On cigars, 4 pesos (\$1.79) each kilo, plus 25 per cent.

Cigarettes, and material for making same, can only be imported by the Government or under concession.

Rifles, and cartridges for same, can only be imported by the Government.

On tobacco leaf, snuff tobacco, chewing tobacco, 2 pesos (89.9 cents) per kilo, plus 25 per cent.

On coal, one-half of 1 centavo (0.23 cent) per kilo, plus 25 per cent.

## PORT REGULATIONS.

Upon the arrival of a vessel in port, the jefe del resguardo (chief of the custom-house guards) at once pays the "visit" and the master must produce for his inspection the following papers:

The ship's register. (2) The ship's crew list.

(3) The ship's passenger list.

(4) The ship's manifest, duly certified by the Colombian consul in the port from which cargo has been brought for this port.

(5) Documents addressed by Colombian consular officers to the collector of customs at this port and to other Colombian officials.

(6) Copies of bills of lading.

- (7) List of articles on board belonging to master and crew and not included in the manifest.
  - (8) List of ship's stores.

(9) Bill of health.

An application must then be made to the collector of customs, by the master or his consignee, to discharge cargo. The manifest is retained by the jefe del resguardo and the other papers are returned, except the bills of health of sailing vessels, which are retained at the custom-house until vessel clears. When ready to load, the master or agent presents to the collector of customs a statement containing the names of shippers, marks, numbers, contents, weight in kilos, value in gold of country to which exported, and destination of each package, and at the same time makes application to same officer for permit to load. If the vessel carries mail, notice of day and hour of departure and names of ports at which she will touch must be given to the post-office department twelve hours before date of leaving. Permission to leave must be obtained from the collector of customs and also from the prefect of the province, the former in duplicate. When these permits are obtained, they are presented to the jefe del resguardo, who retains same and grants permission for vessel to leave.

## PORT CHARGES.

Light-house dues.—For "Puerto Belillo" and "Nisperal" lights, vessels pay 5 centavos (2.3 cents) per ton (net) for first 100 tons, and for each additional net ton, 3 centavos, payable to an officer appointed by the collector of customs. Fifteen per cent of this goes to the Government, 1 per cent to officer collecting, and 84 per cent to the owners of light-houses. Vessels from Cartagena, in addition to above charges, pay 11 centavos (0.69 cent) per gross ton to collector of customs for the "Galera Zamba" light. Five per cent of this goes to the Government, and remaining 95 per cent to owners of light-house.

Cargo dues.—For each ton of 1,000 kilos (2,204.6 pounds) landed, 1.50

pesos (67 cents). Brick and tiles are excepted from this charge.

Permits.—These must have Colombian revenue stamps attached, as follows: To unload, from collector of customs, 2 pesos (89 cents); to load, from collector of customs, 2 pesos; to leave, from collector of customs, in duplicate, 4 pesos (\$1.79); to leave, from prefect, 2 pesos; to clear, from jefe del resguardo, 2 pesos. If a vessel works at night, on Sundays, or on holidays, a special permit must first be obtained from collector, for which an additional charge of 2 pesos is made.

Pier dues at Puerto Columbia (Sabanilla).—These are payable in English gold, or its equivalent, to the Barranquilla Railway and Pier Com-

pany, Limited, and are as follows:

For steamships, first twenty-four hours or fraction thereof, £7 12s. (\$36.99) per hour for each working hour thereafter; for sailing vessels of 50 tons or less, 10s. (\$2.43) per day, and for each additional 50 tons or fraction thereof, 5s. (\$1.22). Sailing vessels, while at the pier, must use the steam crane, for which £1 (\$4.87) per day is charged. Vessels at the pier on Sundays or holidays, and not working, are not charged for such days.

#### BALLAST.

Permits to take ballast from shore must be obtained from collector of customs, or jefe del resguardo, for which 50 centavos (22 cents) per ton is charged.

### FRESH-WATER SUPPLY.

Vessels taking water at Puerto Colombia pay 2 centavos per gallon at vessel's side, to the Barranquilla Railway and Pier Company, Limited.

## PILOTAGE.

For vessels entering river there are two official pilots, whose charges are fixed by law as follows: For schooners, from seaport to Barranquilla, 2 pesos (89 cents); for brigs, from seaport to Barranquilla, 3 pesos (\$1.35); for three-masted barks, from seaport to Barranquilla, 4 pesos (\$1.79); for steamers, from seaport to Barranquilla, 5 pesos (\$2.46). Same charges from Barranquilla to seaport. Vessels requiring pilotage outside of seaport must pay double charges. Such are the legal provisions regarding pilotage, but as a matter of fact, Government pilots can seldom be had to take vessels over the bar at the mouth of the river, and vessels have been compelled to secure other pilotage. A tariff of pilotage charges has recently been promulgated by an unofficial pilot here. It is printed in both Spanish and English, and as some of its provisions are uncertain, I quote it without comment:

## TARIFF OF PILOTAGE VIA BOCAS DE CENIZA.

Sir: I have the honor to inform you that from this date I will charge for a round trip of each vessel as follows: Ship up to 12 feet, \$60 gold; ship over 12 feet, \$10

gold per foot or fraction extra.

NOTE.—The pilotage will be collected immediately after the entrance of each ship, and this tariff holds good taking ships from and to Puerto Colombia. Expenses caused by a vessel to or from Santa Marta or Cartagena, shall be to the agent's account. In every case the agents or consignees shall be responsible for the pilotage. The captain who detains the pilot on board, after fulfilling his duty, shall pay \$4 gold per day.

PUERTO COLOMBIA, January 20, 1899.

As there is occasionally some misunderstanding between masters of vessels and consignees, as to the items included under the terms "port charges," "pilotage," etc., when used in a charter party for this port, it is suggested that attention be given to these matters.

## COASTING TRADE.

Foreign vessels are prohibited from engaging in the coasting trade. Such vessels discharging or taking cargo at points at which there is no custom-house will carry a Colombian custom-house officer. Colombian vessels are exempt from all Government charges, except light-house dues. There are many small sailing vessels of 60 tons and less, engaged in native trade along the coast. These are engaged in considerable traffic between Barranquilla, Santa Marta, and Rio Hacha. The principal coasting trade is, however, carried on from Cartagena, many small sailing vessels plying between that port, the Sinu and Atrato rivers, and Isla Fuerte.

#### QUARANTINE.

In the existing laws is found a very comprehensive system for sanitation and the regulation of quarantines at all ports of Colombia. Owing, however, to the fact that no quarantine station, lazaretto, or receiving station of any kind is maintained at Sabanilla (Puerto Colombia), and to the entire lack of appliances for disinfection and fumigation, it is impossible for the local authorities to enforce the provisions of these laws, and vessels known to come directly from infected ports, as well as those having or suspected of having a contagious disease on board, are not permitted to come to the pier without permission from the health officer, whose duty it is to inspect each vessel entering at the port. I know of no case of detention of a vessel in the port since 1894.

Movement of shipping in the ports of Sabanilla (Puerto Colombia) and Barranquilla, Colombia, during the year ended June 30, 1898.

#### OCEAN STEAMSHIP LINES.

Nine lines of steamers, all carrying mail, passengers, and freight,

touch regularly at Sabanilla (Puerto Colombia).

The Hamburg-American Packet Company (German): Three steamers each month from Hamburg; these touch at Havre, St. Thomas, La Guayra, Puerto Cabello, and Curação. Two also touch at Cartagena and one at Colon.

Compagnie Générale Transatlantique (French): Three steamers each mouth; one of these from St. Nazaire, one from Havre and Bordeaux, and one from Marseilles. These boats touch at several points in the West Indies and at Central and South American ports.

Royal Mail Steamship Packet Company (English): Two regular steamers each month from Southampton, touching at Cartagena, Colon, Kingston, Jacmel, and Barbados, returning via Cherbourg and Ply-

mouth.

Atlas Steamship Company (English): One regular steamer each week from New York via Kingston, returning via Cartagena, Port Limon, and Kingston. Boats of this line also touch every two weeks

at Greytown.

Prince Line, Limited (English): Two regular steamers each month, one from Genoa via Marseilles, Barcelona, Cadiz, and Trinidad, returning via Colon, Progreso, Vera Cruz, Tampico, and New Orleans, and another from Glasgow via Barbados, Trinidad, La Guayra, Puerto Cabello, and Kingston, returning via Port Limon, Vera Cruz, and New Orleans.

Transatlantica Española (Spanish): One regular steamer each month from New York via Havana, Santiago de Cuba, La Guayra, and Puerto Cabello, returning to New York via Cartagena, Colon, Santiago de

Cuba, and Havana.

The Veloce (Italian): One regular steamer each month from Genoa via Barcelona, Santa Cruz de Teneriffe, Ponce, St. Thomas, La Guayra, Puerto Cabello, and Curaçao, returning via Cartagena, Sabanilla, and same ports as on outward trip, except Barcelona.

Harrison Line (English): One regular steamer each month from Liverpool via Barbados, Trinidad, La Guayra, Puerto Cabello, and Curaçao, returning via Cartagena, Galveston, or New Orleans.

West India and Pacific Steamship Company (English): Two regular steamers each month from Liverpool via Barbados, Trinidad, La Guayra, Puerto Cabello, and Curação, returning via Cartagena, Colon, and New Orleans

Ocean freight and passenger rates between Sabanilla (Puerto Colombia) and European and American ports.

#### INTERNAL TRANSPORTATION FACILITIES.

## RAILWAYS.

At present, there are about 389 miles of railroad in operation in Colombia.

The Santa Marta Railroad Company (English), from Santa Marta to Sevilla, 46 miles; proposed extension to Heredia, a town on the Magdalena River, 80 miles from Barranquilla.

The Barranquilla Bailway and Pier Company (English), from Barranquilla to Puerto Colombia, 17½ miles, connected with steel pier 4,000 feet long, extending into 26 feet of water.

The Cartagena and Magdalena River Railway (American), 65 miles,

from Calamar to Cartagena.

The Panama Railway Company (American), 47 miles, from Panama to Colon.

The Antioquia Railway Company, owned by the State of Antioquia, built from Puerto Berrio, on the Magdalena River, to Caracoli, a distance of 50 miles; proposed extension of 75 miles to Medellin.

La Dorada Railway Company (English), built from La Dorada to Honda and "Arranca Plumas," a distance of 22 miles; proposed exten-

sion of 35 miles to Cambao.

The Girardot Railway Company (Colombian), built from Girardot to Juntas de Apulo, a distance of 24 miles; proposed extension of 48 miles to Madrid, to connect with the Facatativa and Bogota Railway.

The Sabana Railway (Colombian), from Facatativa to Bogota, a dis-

tance of 24 miles.

The Cucuta Railway Company (Colombian), built from Cucuta to Puerto Villamizar, on the river Zulia, a distance of 34 miles; extension to Venezuelan frontier now in process of construction, with 2 miles already built.

The Northern Railway Company (Colombian), from Bogota to Zipa-

quira, a distance of 31 miles.

The Cauca Railway Company, now controlled by the State of Cauca, from Buenaventura to Apula, a distance of about 28½ miles; proposed extension to Cali.

During the last two years, a number of new railroads have been projected and concessions obtained from the Government, but only about 32 miles of road have been built. I am informed that no work has been done on the proposed railroad from the Magdalena River to Bucaramanga, referred to in report of my predecessor made October 1, 1897.

#### RIVER STEAMBOATS.

The Magdalena River is navigable for steamboats for 779 miles. Steamboats from Barranquilla ascend to La Dorada, a distance of 5921 miles. The altitude of La Dorada is about 600 feet above that of Barranquilla. Yeguas was formerly the head of navigation on the lower river, but steamers now go no higher than La Dorada. Here, dangerous rapids are encountered, and passengers and freight for points on the upper river must be transferred by railroad a distance of 20 miles, to Arranca Plumas, a point about 1 mile above Honda. Above Arranca Plumas, the river is navigable for small boats to Neiva, a distance of about 187 miles. The Cauca, Nechi, and Lebrija rivers, tributaries of the Magdalena, afford an additional 215 miles of navigation. On these rivers there are 42 steamboats, with a total tonuage of 7,331. They vary in size from 313 to 30 tons, and are operated by seven different companies. Broad, stern-wheel boats are used. The largest boats do not draw much over 3 feet when loaded. The fuel used is wood. Rate of travel up river, about 2 leagues per hour; down river, about 4 leagues per hour. A number of the best and most satisfactory boats in use have been built in the United States. They were brought out in pieces and put up at Barranquilla. During the year 1898, these steamers carried passengers and freight to and from this port as follows:

Up river:	tons	
Freight	tons	28,850
Passengers		8, 119
Down river:		
Freight	tons	25, 817
Passengers		8, 410

Compared with the year 1897, the tonnage was 7,852 tons less for 1898. This tonnage does not include considerable river cargo destined for Cartagena, which is taken from steamers at Calamar, a point above Barranquilla, and transferred thence by rail 65 miles to the sea board.

River steamboats leave Barranquilla on the 3d, 6th, 9th, 12th, 15th, 18th, 21st, 24th, 27th, and 30th of each month. Other boats also depart at irregular dates. Boats arrive regularly on the 3d, 9th, 15th, 21st, and 27th of each month.

Passage from Barranquilla to La Dorada—first class, 75 pesos (\$23,25); second class, 37.50 pesos (\$11.62); third class, 25 pesos (\$7.75). From La Dorada to Barranquilla—first class, 50 pesos (\$15.50).

Passengers are allowed baggage as follows: First class, 150 kilos (330 pounds); second class, 75 kilos (165 pounds); third class, 50 kilos

(110 pounds).

Freight up river, Barranquilla to La Dorada, 47 pesos (\$14.57) per ton of 1,000 kilos, or 1 cubic meter of bulk, at the option of the company. Rebates of from 60 to 20 per cent are allowed on certain classes of freight. As will be noted, passenger rates down river are much less than those charged going up. The down-river freight charges are also less.

## PACK MULES.

Upon leaving the rivers, freight and passengers are transferred on the backs of mules. There are practically no wagon roads. The load "carga" for a mule is, for most of the routes, 250 pounds. Mules in the Medellin route take 300 pounds. In order that this may be properly balanced on the animal, it must be capable of an almost equal division into two parts. Passengers and freight for Bogota leave the river at Honda, and thence are carried by mules to Facatativa, a distance of 45 miles. The trip is made by passenger mules in two and one-half to three days. The charge for a passenger mule-for this trip is 20 pesos (\$6.20). Passengers and freight for Medellin leave the river at Puerto Berrio. Bogota and Medellin, the principal interior cities, are reached from this coast as follows:

## BOGOTA.-(ALTITUDE 8,985 FEET ABOVE SEA LEVEL.)

Route.	Miles.	Fare in Colombian currency.	Equivalent in United States gold.	Time.
Barranquilla to La Dorada	22 by rail 45 by mule	3. 10 20. 00	\$23. 25 . 96 1% 6. 20 . 37 1%	8 to 9 days. 2 hours. 2 to 3 days. 14 hours.
Total	683	99. 30	30. 78 30	12 days, 31 hours.

### MEDELLIN.

Barranquilla to Puerto Berrio Puerto Berrio to Caracoli Caracoli to Medellin	486 by steamer 50 by rail 84 by mule	Pesos. 62.50 4.00 12.00	1. 24	6 to 7 days. 3 hours. 14 to 2 days.
Total	520	78. 50	24. 83	9 days, 8j hours.
1			Digitized by	<del>POPPLE -</del>

Rates for transportation to other points are, with slight variation, in proportion to those for places given. Transportation of freight requires a much longer time.

#### POSTAL RATES AND PARCEL POST CHARGES.

#### INTERNAL AND EXTERNAL.

Letters for the interior pay 5 centavos (1.5 cents) for each 15 grams (one-half ounce), and an additional 5 centavos for every 15 grams over this weight.

The newspaper publications of this country will be delivered to the

interior free of charge.

Declared values, 10 centavos (3 cents) for each 10 pesos (\$3.10) or fraction of same; sums over 100 pesos will not be admitted when sent by same party to same address; only remittances made in paper currency will be received. Letters for the exterior pay 10 centavos (3 cents) for each 15 grams (one-half ounce), and an additional 10 centavos for every 15 grams over this weight.

Printed matter pays 0.01 centavo (0.03 cent) for each 50 grams (13 ounces), 0.02 centavo (0.06 cent) up to 100 grams (31 ounces), and 0.01

centavo for each additional 50 grams (13 ounces), etc.

If the letter or package is registered, it will pay 10 centavos (3 cents)

additional; if with advice of receipt, 15 centavos additional.

Printed matter must not exceed 2,000 grams (703 ounces) of weight; samples must not exceed 250 grams (83 ounces) of weight.

#### PARCEL POST EXTERIOR.

For the United States, 29 centavos (\$0.08) for each pound up to 5 kilos (11 pounds); for England, 1.44 pesos (\$0.44) for each pound up to 1 kilo (2.2 pounds); 2.52 pesos (\$0.78) for each pound up to 3 kilos (6.6 pounds); 3.48 pesos (\$1.07) for each pound up to 5 kilos (11 pounds); for France, 1.80 pesos (\$0.55) for each kilo up to 5 kilos; for Germany, 1.80 pesos for each kilo up to 5 kilos.

## CABLE RATES.

This port has no direct cable communication with Europe or the United States. The nearest cable station is at Colon. Cables for Europe and the United States must be telegraphed to Colon via Bogota, Buenaventura, and Panama. As the telegraph lines are frequently out of order, the service is very unsatisfactory, and cables are frequently sent in the first instance to Colon by steamer. By this method, they reach the cable station in twenty-six hours. As the station is in the department of Panama, these rates are payable in Colombian silver or its equivalent in paper currency. If paid in paper, 20 per cent must be added. The rates charged are as follows:

For the United States, per word, \$2.99 Colombian silver (\$1.34); for England, France, and Germany, per word, \$3.58 Colombian silver (\$1.61); for Havana, per word, \$3.74 Colombian silver (\$1.68); for Caracas, Venezuela, per word, \$7.21 Colombian silver (\$3.24); for Curaçao, per word, \$6.35 Colombian silver (\$2.85); for Colon and Panama,

per word, \$0.50 Colombian silver (\$0.22).

## EXCHANGE AND CURRENCY VALUES.

During the eighteen months ended December 31,1898, there has been a gradual depreciation in the gold value of the paper peso, which is the

monetary unit throughout Colombia, except in the department of Panama.

For the month of July, 1897, exchange at this city was as follows: Ninety days on New York, 157 per cent premium for American dollars; ninety days on London, 150 to 152 per cent premium for pounds sterling; ninety days on Paris, 150 per cent premium for francs; ninety days on Hamburg, 148 per cent premium for marks.

During the year 1898 and the first month of 1899, drafts sold for

ninety days on New York as follows:

Month.	Premium for dollars.	Month.	Premium for dollars.	
January February March April May June July Angust	175 to 180 177 to 180 180 to 190 185 to 192 195 to 200 200 to 206	September	210 to 220 207 to 215 220 to 225	

As is indicated by these figures, the paper peso, which in July, 1897, was worth about 38.9 cents in gold, is now worth only about 28.5 cents.

#### INTEREST.

The legal rate of interest is 12 per cent per annum.

## BANKING.

There is but one bank in the Republic which is permitted to issue bills. This is the Banco Nacional de la Republica de Colombia at Bogota. It is in fact a branch of the Government. It is stated upon the face of its bills that they are payable in current money. It is impossible to state the exact amount of such paper money in circulation, as no late statistics are available. Conservative estimates place it at 40,000,000 pesos. There is one bank in Barranquilla. It is a private institution with a capital stock of 850,000 pesos, 55 per cent of which is paid up. This bank does a considerable business, principally in inland bills and local discounts. Interest at the rate of 6 per cent per annum is allowed on time deposits. This bank sells some bills on Europe and the United States, but owing to the unsettled condition of exchange, it is difficult to obtain a foreign draft.

It is interesting to note the method by which foreign remittances are made to Europe and the United States. As has been stated, it is difficult to secure a foreign draft from the local bank, and the greater proportion of the business is conducted entirely outside of this institution. A party desiring to purchase a draft makes inquiry for the same at some of the commercial houses. These houses, in addition to issuing their individual drafts, are generally supplied with good paper drawn by parties in the interior on Europe and the United States. The price at which drafts for either dollars, pounds, francs, or marks are sold is influenced not only by the existing rate of exchange, but by the opinion of the buyer and seller as to the prospective rise or fall in currency values. The rate is subject to the most erratic changes. It often fluctuates as much as 10 points in a day.

#### CREDITS.

In respect to commercial credits, European exporters offer greater inducements to merchants here than do their United States competitors. As a rule, European houses allow six, nine, and twelve months, charging interest on the account, while the United States sells on sixty and ninety days.

## PASSPORTS, COMMERCIAL MARKS, ETC.

Passports are not required from foreigners in Colombia.

Licences are not required from commercial travelers, or for carrying on mercantile business.

There are no laws of a discriminating character affecting foreign vessels, persons, or goods; nor is there any law requiring imports to be marked so as to show country of origin or manufacture.

Retail liquor dealers in this city are required to procure licenses, the charges for which are from 3, 5, 10, and 20 pesos per month, according to class.

Distillers of rum pay license according to capacity of still, the rate being from 600 to 1,800 pesos per month.

## LOCAL MANUFACTURES.

There are in Barranquilla a number of industries which are turning out a fair quality of goods.

#### SOAP AND CANDLES.

There are five soap and caudle factories. Under date of May 10, 1898, I sent a full report on the production, sale, and consumption of soap. Fine stearin and many tallow candles are made in this city. The stearin candles are put up in 1-pound paper packages containing 4, 6, 8, 12, or 16 candles, according to size, and are retailed at 40 centavos, equal to 12.4 cents United States gold, per pound.

#### LEATHER.

A large amount of sole leather is made at the six tanneries now in operation. One of these turns out about 2,000 hides per month. The hides weigh from 8 to 16 pounds and retail at about 80 centavos (24.8 cents) per pound. For tanning, the berry of the dividivi, a product of the country, is used.

#### BRICKS AND TILES.

There are eight factories. The bricks are made of unground clay, dried in the sun and burnt in kilus. Wood is used for fuel. The ordinary size of bricks is 5 by 10 by 2 inches. Bricks retail at 14 pesos (\$5.54) per 1,000; tiles, at 70 pesos (\$21.70) per 1,000.

#### SHOES.

There are about a dozen shoe factories and many more small shops, each of which turns out a number of shoes for men, women, and children. Machines are used in sewing the uppers, but all other work is

<sup>&</sup>lt;sup>1</sup> Printed in Special Consular Reports, XV.

done by hand. Such shoes are made to order at the following prices: Men's calf sewed shoes, 9 to 12 pesos, equal to from \$2.79 to \$3.72; men's calf pegged shoes, 6 to 8 pesos, equal to from \$1.86 to \$2.48; men's patent-leather shoes, 10 to 14 pesos, equal to from \$3.10 to \$4.34; women's calf sewed shoes, 6 to 8 pesos, equal to from \$1.86 to \$2.48; women's calf pegged soles shoes, 4 to 6 pesos, equal to from \$1.24 to \$1.86; children's sewed shoes, 3 to 5 pesos, equal to from \$0.93 to \$1.55; children's pegged shoes, 4 to 6 pesos, equal to from \$1.24 to \$1.86.

The popular articles of foot wear for working people and servants are the native slippers (zapatos) and a kind of sandal (alpargatas). The zapatos are made of white canvas or cheap black velvet, with leather soles, and with or without heels. Most of these are made by the natives at their homes, and are sold at the market or in the streets at from 60 to 80 centavos (18.6 to 24.8 cents). The sandals come principally from the departments of Antioquia and Tolima, where they are made by the natives. The material is hemp, with wool or cotton toe and heel pieces, and they sell at from 40 to 80 centavos. Neither the shoes made here nor those imported from other countries compare in style, quality, or finish with the better class of shoes made in the United States, but such shoes are not seen in this market. I have seen some shoes from the United States, but they were of an ordinary class, little better in appearance than those imported from France, Spain, and Germany. the best shoes and slippers made in the United States were introduced, I am satisfied they would find ready sale with the better classes.

#### HATS.

It is in the selection of his hat that the native peon, the workman, boatman, and muleteer is most fastidious and goes to the greatest extremes. It is not at all uncommon to see a man wearing a pair of zapatos, or slippers, worth about 15 cents gold, and a suit of coarse drill, worth about 62 cents gold, with a hat worth 20 pesos, or \$6 gold. These hats have tall crowns and broad rims. They are made in the country, of native grass, and some of them are beautifully plaited. They cost, as a rule, from 4 to 20 pesos, but I am told that some are worth 50 and even 100 pesos. They are known in commerce as Panama hats, but, as a matter of fact, few if any hats are made in Panama, and those worn here come from the departments of Antioquia, Cundinamarca, and Tolima. A cheaper and commoner grade of plaited grass hats is also made in the country and retails at about 3 pesos (93 cents gold).

#### RUM

There are eight distilleries of rum in Barranquilla alone, and many others throughout the country. The rum is made of native cane, and retails at from 1.20 to 4 pesos (37 cents to \$1.24) per gallon, according to age.

## COFFEE AND HIDES.

The appended table of exports shows the quantities of these important staples sold to Europe and the United States. As the prices are fixed in the foreign market, they need not be quoted here.

#### TOBACCO AND CIGARS.

A great quantity of cigars are made at Ambalema, in the Department of Tolima, from native tobacco. These sell at from 30 to 80 pesos, (\$9.30 to \$24.80) per thousand. The form in which tobacco is mostly

used, however, is the "Calilla" (a kind of cheroot). These are made everywhere in the country, from Ambalema tobacco. They cost from 50 to 80 centavos (15 to 24 cents) per hundred, and are smoked by the women as well as by the men. Women charge 20 centavos (6 cents) per hundred for making them. Pipes are seldom seen. Little chewing tobacco is used.

## FURNITURE.

A great deal of ordinary furniture is made here by native carpenters, and there are now several establishments which make very good furniture to order. Large cedar wardrobes cost from 50 to 150 pesos (\$22.45 to \$67.35), according to finish. Sideboards and bureaus from 40 to 90 pesos (\$17.96 to \$40.41); stands and tables from 40 to 90 pesos (\$17.96 to \$40.41). There are few bedsteads made here. The native ent is most commonly used. These cost, including canvas cover and frame for mosquito net, from 10 to 20 pesos (\$4.49 to \$8.98). Most imported bedsteads are of iron. These are supplied with canvas and have iron frames for net; a fair quality retails as follows: Three-quarter width, 40 pesos (\$17.96); full width, 64 by 4 feet, 56 pesos (\$25.14). Full suits of furniture are seldom imported or made. Upholstered furniture is not suitable to this warm climate and little is imported; none is made here. Wardrobes and chests are made of cedar, which is preferred to other woods, for the reason that articles kept in them are safe from the attacks of the "comejen," an insect very troublesome in this climate. All imported furniture comes "knocked down." Cane-seated chairs are principally of Austrian and Bohemian make, and reach this market through German ports. They are generally made of round bent wood, and are light and cool. They retail as follows: Chairs, 60 pesos (\$18.60) per dozen; large rockers, 20 pesos (\$6.20) each; small rockers, 12 to 16 pesos (\$3.72 to \$4.96) each; sofas, 35 to 60 pesos (\$10.85 to \$18.60) each. The only chairs I have seen in this market are the common yellow chairs with cane seats. They retail at 34 pesos (\$10.54) per dozen. Rockers of same class retail at from 16 to 18 pesos (\$4,96 to \$5.58) per pair.

#### LUMBER.

Inch boards of yellow pine and cedar sell at from 12 to 15 centavos (3.7 to 4.6 cents) per square foot.

# UNITED STATES AND OTHER FOREIGN GOODS.

While the United States has a considerable trade with this port, I am convinced that the volume of our exports might be largely increased. It must be borne in mind that of the large number of merchants in this city, not one is American. England, France, Holland, Italy, Spain, Germany, and Switzerland are all well represented; and many of the large houses have business connections in Europe. It is only to be expected that these mercantile houses are best acquainted with European goods, and through them, the manufacturers in their respective countries have received valuable information as to the requirements of this market. The extended credit allowed by European houses is a great inducement to buyers here, since they, in turn, must sell on two, four, or six months.

With few exceptions, American goods introduced here have been well received by the consumer, and many more might be sold were they placed before the public. I believe that by the establishment and maintenance of a well-conducted sample house in this city, exports from

the United States could be very largely increased. Catalogues and price lists, even when profusely illustrated and printed in the Spanish language, do not attract the same attention as do the articles themselves. I know of several instances in which the importation of a United States article by a private party has led to the immediate sale of several of its kind. For example, a fine oil range was recently imported from the United States by an American resident in this city. Several of the same kind have since been sold to parties who saw it, and these will lead to the sale of others. Many lines of American goods are wholly unknown to the consumer here.

European factories turn out goods especially adapted to this market. Bright-colored cotton and wool blankets of fancy patterns, attractive saddle pads, wool and cotton ruanas, good imitations of old Spanish brass stirrups, spurs, bits, and other attractive trappings for horses,

are imported here.

A glance at the table of imports will show the trend of the trade.

I mention only a few of our articles, which are seldom if ever seen here. Fine shoes and slippers, fine and cheap hats; clothing, ready-made and made to order (merchants in this city take orders for clothes to be made in Europe, and it requires about three months for the order to be filled); attractive curtains, fringes, and other trimmings; cash registers, appliances for conveying money and change in retail stores (I understand that one was imported from the United States, but rubber elastic was used, which soon becomes worthless in this climate), kodaks and other amateur photographic outfits, and handmills for making corn meal. One of these was recently imported, but it required too much power. In this climate, corn meal soon becomes unfit for use, and very little is imported. The women grind the native corn between stones, a most primitive and tedious method. Other labor-saving machines and devices of American make would sell here if known.

A steam laundry is needed. At present, almost all washing is done by women at the river side—the clothes, much to their detriment, being drubbed over logs and stones, or thrashed with sticks. The washerwomen frequently keep the clothes as long as two weeks. In this warm climate, many white and other wash goods are worn both by men and

women.

# TEXTILES.

Dress goods of the better quality should be in patterns of the following lengths: 30 inches wide, 10 yards; 24 inches wide, 12 yards; 20 inch wide, 15 yards. Prints should be in pieces of 30 yards even. One of the chief objections to American dress goods and prints is that they are cut in unsatisfactory lengths. The merchants sell these goods by the piece, and if the piece contains a few yards or a fraction of a yard over the average length, they get no more for it. With a combination of lengths in one case, such as that to which a merchant called my attention to day, viz, 34.2 yards, 59.2 yards, 45 yards, and 62 yards, it is out of the question to sell at an equal price per piece, and the lot is troublesome to handle. This same merchant said to me: "It is of no use to make the request. Your manufacturers will not cut these goods in lengths to suit this market. We know we can not sell prints and dress goods by the yard, but your manufacturers seem to think that we can."

#### PACKING.

All goods for the interior should be so packed as to prevent their being damaged, not only by the heavy rains to which they are likely to

be exposed, but from the rough handling to which they will be subjected. Packages for the interior should not weigh over 125 pounds. The boxing and wrapping should be as light as possible, but must at the same time be strong, and the goods should be well provided against the many vicissitudes to which they are likely to be subjected ere they reach their destination in the interior towns.

## COMMERCE.

Principal imports into the port of Barranquilla for the year ended June 30, 1898.

Total exports for year ended June 30, 1898, 29,967,100 kilos (66,065,469 pounds); value, \$9,659,135.61.

#### SANTA MARTA.

As the market receives its principal supplies from that of Barranquilla, direct importations are light, and consist mostly of provisions from the United States. During the year ended June 30, 1898, they were as follows:

Cou	intry.	Value in United States gold.
EnglandFrance		\$19, 120, 70 8, 368, 80
Germany		11, 112, 25 1, 629, 00 44, 406, 32
		84, 637. 07
	Digitized by $G$	<del>bogle-</del>

The chief article of export is the banana, of which about 40,000 bunches are shipped to New York each month. Planters receive 20 cents gold per bunch of not less than 9 hands. At this price, it is claimed, they make a fairly good profit.

Vessels entered and cleared at the port of Santa Marta during the year ended June 30, 1898.

No.	Nationality.	Tonnage.
7 8 4 19 51	Steamships:  English  German  Danish  Total  Sailing vessels:  Dutch	13, 201 7, 875 2, 520 23, 596 890

Including the suburbs, the city of Santa Marta has a population of about 6,000.

#### INDUSTRIES.

There are 12 rum distilleries, 1 sugar factory, and about 20 sugar mills. The harbor is one of the finest and best on this coast. The port regulations are about the same as those at Barranquilla.

#### RAILWAYS.

The Santa Marta Railway connects the city with Sevilla, a small interior town about 46 miles distant. It is reported that the company operating this road will extend it to a port on the Magdalena River. I am also informed that the railroad company has ordered some small steamers which are intended to ply on the caños (lagoons) between Santa Marta and Barranquilla, a distance of about 75 miles. By this means, it is expected that the commerce of Santa Marta will be greatly increased.

## COFFEE, SUGAR, AND CACAO PLANTATIONS.

Considerable capital has recently been invested in such plantations. Some are already beginning to yield. Four or five are owned by United States citizens, others by Englishmen and Germans. The land is reported to be well adapted to such uses, and has the advantage of proximity to the harbor. The most distant of the present plantations is not over 18 miles from Santa Marta. Large tracts of such uncultivated land can be acquired from the Government at about 50 cents per acre. The temperature varies according to altitude, and ranges from 50° to 80° F.

#### RIO HACHA.

Rio Hacha, the capital of the Province of Padilla, in the Department of Magdalena, is a small seaport, about 90 miles east from Santa Marta. It has a population of some 5,000. It is the only port for a large territory, containing 50,000 inhabitants, of which about 7,000 are Indians, uncivilized. Its imports and exports are carried almost exclusively via the Island of Curação. About one-third of the entire trade is with the United States.

## Exports from Rio Hacha during the year ended June 30, 1898.

Article.	Weight in kilos.	Value in gold.
Coffee	1, 254, 229 68, 178 1, 050 8, 300 126, 901 3, 360 200	\$22, 298, 20 43, 750, 00 10, 921, 20 40, 00 620, 00 49, 802, 00 290, 00 10, 00 30, 00
Total	1, 558, 435	127, 761. 40

The hides and skins go chiefly to the United States.

# Imports into Rio Hacha during year ended June 30, 1898.

Article.	Weight in kilos. a	Article.	Weight in kilos. a
Candles		Liquors	19, 294

Lumber	21, 340	Total	491, 101

a Kilo equals 2.2046 pounds.

Total gold value of imports, \$63,930.

The leading articles of import from the United States are flour, sugar, lard, butter, provisions, drugs, and cotton goods.

## PORT REGULATIONS AND CHARGES.

These, with the exception of light-house dues and charges for water, are about the same as at Barranquilla.

# LIGHT-HOUSE DUES.

For vessels of 100 tons or less, 5 centavos (1.55 cents) per ton, and for each additional ton 2½ centavos. Vessels taking water from river pay 4 to 6 pesos, according to size. During the year ended June 30, 1898, 164 small sailing vessels, with a total tonnage of 7,561 tons, entered the port.

The nationality of these vessels was as follows:

~	_
Colombian	8
Danish	
	5
English	
Norwegian	
Swedish	
Venezuelan	
<b>-</b>	16
' 'l'otal	16

#### INDUSTRIES.

There are no manufactures. The people are principally occupied in stock raising and agricultural pursuits, the latter being conducted in a most rudimentary manner.

#### TRANSPORTATION.

There are no railways. Roads leading to the interior are in very bad condition. In fact, they can hardly be termed roads. Mules and burros are used for transportation, which is both difficult and expensive.

Schooners and other small sailing vessels ply between this port and Curação and Santa Marta. For the trade with the coast, small lighters

are used.

### COMMERCE OF RIO HACHA.

Being the principal seaport of the province and in fact of the Goajira Peninsula, the commerce is of considerable importance. A large section is inhabited and controlled by the Goajira Indians, who, while they stubbornly resist any encroachment on their territory by settlers, neverthe-

less do considerable trading at Rio Hacha and nearby points.

Rio Hacha merchants have agents in and commercial relations with Europe and the United States, but in the absence of direct communication they are compelled to employ commission men in Curaçao, who receive and forward merchandise from and to Rio Hacha. This, together with the expense of transshipment at Curaçao, greatly increases the cost of goods. Direct communication with the United States would be a vast benefit to this port. I am informed by the United States consular agent there that many lines of our goods are wholly unknown in Rio Hacha, and the agent suggests that the trade with the United States could be largely increased if samples of our goods, accompanied with full particulars as to price, were placed with merchants. The agent writes me that several articles of American manufacture are sold there as English, French, and German products.

W. IRVIN SHAW, Consul.

BARRANQUILLA, January 30, 1899.

#### BOGOTA.1

Desiring to make as full and satisfactory a report as possible on the commerce and industries of this consular district for the year 1897 and the first half of 1898, I have made diligent search for official statistics, which, I regret to say, are not obtainable. It may be said to be impossible to procure at this national capital returns giving anything like a satisfactory idea of commerce and industries. The National Government has recently sought to revive a bureau or office of statistics, but it yet remains to be seen what ground will be covered in this way, and how useful this work may prove in furnishing such information as the Department requires. In the matter of exports and imports the consuls on the coast, being in direct touch with the custom-houses, can give detailed information that I have been unable to secure here.

From unofficial sources and from that which is obvious to any observer,

it may be said that the trade not only in this consular district but of the whole country has been unusually flat for the first half of the present year. Very much of this is attributed to the uneasiness resulting from a Presidential election, from a change of national administration, and from apprehension of internal disturbance. The apprehension has to a considerable extent passed away, and yet it can not be said that general trade has begun to revive. The Government has found itself hard pressed for money, and many of its employees and contractors have gone unpaid, and this in itself has operated unfavorably on trade conditions. A diminished coffee crop, with high freights and low prices, has contributed to produce the present situation.

Careful inquiry points to the encouraging fact that United States manufactures have perhaps suffered less than those of other countries in this market. This is attributed to the acknowledged merit of the American products which have gained a foothold here. In the matter of boots and shoes, a line in which the excellence of our products is admitted, a wider market should be had, and probably could be had, by giving more heed to Colombian taste in this regard. Certain styles are preferred, and others, though more acceptable in the United States. are not so readily received. It is admitted that American cotton fabrics stand at the head, but as an offset, dealers say that fabrics of less merit but of lower price sell better. There should be a good opening here for the cheap and modern grades of American furniture, since the domestic article, although substantial, is produced by rather primitive methods, and, as a rule, a variety of styles is lacking. Material for furniture is brought from a distance, carrying being done on the backs of natives or mules. The finishing is almost always done by hand, machinery being very little used. I believe that simple and labor-saving machinery would find a ready market here. American silver-plated ware is admitted to be the best that comes to this market, but there are European products in this line that sell at lower prices.

As a rule, United States machinery is preferred, when our manufacturers can be induced to bear in mind the hard transportation conditions and consent to construct their machinery accordingly. This relates especially to machinery for coffee or sugar plantations. American ranges (steel), with economy of detail, and manufactured with a

view to close and safe packing, have found ready sale.

It should be noted that some manufacturers have been willing to take advice from those that know what is necessary, and are sending their

goods packed as well as those from Europe.

The matter of credits is always of deep interest. European houses give six and twelve months' credit, and some of them extend this to eighteen months, charging interest on the sales. When one considers that the time required to ship goods is from six to twelve months, it is not to be wondered that merchants complain that American houses give too short credits, for it sometimes happens that the time for payment expires some months before they receive the goods.

An American bank here, familiar with commercial and financial conditions, and strong enough to command the confidence of the people, would be a great aid in advancing our commercial interests along the

whole line.

There has been no change in the monetary system, except that a great deal of subsidiary currency has been called in and silver issued in its stead. The fluctuations in foreign exchange have been more marked than usual, but with a quieting of political conditions, there is likely to be more stability in this regard.

A United States corporation, known as the Colombian Traction and Express Company, has brought into this country a traction engine and train of cars, with a view to operating this system between Bogota and the Magdalena River. The express business has been inaugurated in Bogota, and the contrast of the magnificent horses and the neatly painted wagons with the cumbersome and easy-going ox teams is not only marked, but is a revelation to the Colombians.

There are only one or two manufactories of cotton textiles in this country. These are as yet of little importance, and do not compete with foreign imports to any great extent, as the prices for their very ordinary products are comparatively high. Whites, grays, prints, and indigo prints are imported principally from Manchester, and are conveniently bought in pieces of the following lengths: Whites, 24 yards; grays, 18 yards; prints, 30 yards.

The trade of the United States in this line suffers much from the fact that exporters will not send the pieces made up into the above uniform lengths.

The measures required by the coarser of these goods are approxi-

mately as follows:

Class of goods.	Number of picks to inch.	Width in inches.	Yards per pound.
Whites Grays Prints Indigo prints	64 by 64 60 by 50	234 to 24 25 to 254 23 to 24 22 to 23	18 61 11 114

The number of picks to the inch, the width, and the weight increase with the quality of the texture, but the heavy weight of the coarser sorts is accounted for by the amount of finish put in by the manufacturers. American imports are of much better quality, without finish. A very poor cloth with the required finish finds a good market.

JAMES C. McNally, Consul-General,

BOGOTA, October 25, 1898.

#### CARTAGENA.

Official figures as to an increase or decrease in exports and imports of this city can not be obtained, and I can state only the salient facts as to commercial and industrial conditions.

# CURRENCY.

The rate of exchange is based on American gold. During the last six months the rate increased to \$325 currency for \$100 American gold, but in this month, on account of the changes in government, it has decreased to \$305 for \$100 American gold.

decreased to \$305 for \$100 American gold.

The actual amount of currency in circulation is estimated at \$100,000,000. This sum is not sufficient for the commercial needs of

the nation.

# Wages.

currency.	United States currency.
2.50 1.20 to 1.50 2.00 to 3.00 1.20 2.00 to 3.00 4.00 to 8.00 20.00	\$0.837 to \$0.422 1.06 0.51 to 0.63 0.844 to 1.266 0.51 0.844 to 1.266 1.68 to 8.37 8.44 0.844 to 1.68
	\$0.80 to \$1.00 2.50 1.20 to 1.50 2.00 to 8.00 1.20 2.00 to 3.00 4.00 to 8.00

# CUSTOMS DUTIES AND REGULATIONS.

At the commencement of the year customs duties were increased 20 per cent, as follows:

First class of the tariff (gross weight), free; second to thirteenth class, 20 per cent increase on liquidation (law 160, of 1896); fourteenth and fif-

teenth classes, 50 per cent increase on liquidation; sixteenth class, \$3 (\$1.266) per kilogram, plus the former 25 per cent; special for tobacco leaf and plug, \$2 (\$0.844) per kilogram, plus 50 per cent.

American products are not especially affected by taxes or octroi duties, excepting the general tax of \$4 (\$1.68) a ton charged for ascent of the Magdalena River, and \$1.60 (\$0.675) a ton for descent.

## IMPORTS AND EXPORTS.

The Department of Bolivar consumed the following American goods in the first six months of 1898:

	Quantity.	Weight.
Flour bags Wire rolls Petroleum, refined cases Lard do Tobacco leaf packages	7, 788 10, 438 10, 018	Pounds. 1, 171, 430 780, 239 1, 150, 197 144, 955 14, 952

The importation of American leaf and plug tobacco has decreased, on account of the high customs duties. Messrs. Merlano & Co. of this city have established a factory for the manufacture of the latter article, which they prepare mainly with domestic leaf. Although imperfect as yet, the product finds a ready market and is exported to Colon and Panama.

#### SUGAR.

Refined sugar is all imported from Germany. Raw sugar is produced in the country in small quantity and of inferior quality. Small wooden mills are generally employed for grinding the cane. If iron mills, to be worked by animal power, were sent from the United States, they would probably find willing purchasers.

There are two manufactories of candles, Messrs. Merlano & Co. and Lequerica Brothers. The stearic acid employed is imported from

Germany.

Messrs. Merlano & Co. possess a factory for spinning and weaving cotton and linen goods. The flax is imported and the cotton (of first class) is grown in the country. This factory produces 15,000 to 20,000 yards a week of coarse cloths of fair quality, but unattractive finish. The machinery is imported from England and the cotton seed is exported to that country. Leaf tobacco is exported to Germany, and coffee to Europe and the United States.

#### FREIGHTS.

Freights from the United States to this country are higher than those from Europe, owing to the fact that there is only one line of steamers from New York—the Atlas—touching at Kingston, Barranquilla, and Cartagena.

## COMMERCIAL LICENSES AND CREDITS.

Business is entirely free in all the territory of the Republic. No passports are required. Foreigners and natives enjoy the same privilege in this respect. Purchases from Europe are on the basis of three, six, and nine months' credit, with 6 per cent interest a year. Agreements are generally fulfilled with exactness. With the United States, three months' credit is given.

The province of Antioquia buys, sending gold and silver ore in advance, and sells the same goods to its customers on eighteen months'

credit.

## GENERAL REMARKS.

Americans should control the market in cotton domestics and prints, hardware, and food stuffs. The failure to do so in the past is largely due to the unwillingness of our manufacturers to comply with what seem to them the petty demands of the trade here. On account of qualities and prices, United States prints and all cotton goods would be preferred if the local demands were complied with, even leaving out the question of credits.

Shelf hardware, perhaps, could not compete with the cheaper qualities from Germany, since the trade is not educated up to the American standard. Appearance determines the selling value as well as the

quality.

In the matter of food stuffs, the more common or necessary products are already brought from the United States, but canned and bottled

goods offer a good opening.

Almost all the tools and machinery in the country could be improved, with immense benefit to the industries here, but these industries, with a few exceptions, are not in a financial position to employ any but the commonest articles.

#### TRANSPORTATION FACILITIES.

The Cartagena Railroad belongs to an American company, with privileges from the Government. This company has bought the fleet of river steamers and has improved and augmented their number. It gives bills of lading from Honda (up the river) to Europe, the United States, and vice versa. This enterprise has a great future before it.

Three steamers run on the Atrato and Sinú rivers. Railroads run through the departments as follows:

Antioquia, Puerto Borrio to Caracoli	Miles. 36
Bolivar:	07 07
Barranquilla to Pto. Colombia	27.97
Cartagena to Calomar	66. <del>4</del> 8
Cauca, Buenaventura to Cali	24.85

Barcelona Havana	3.64	1.6
Jaraoss Juraoss		3.90 2.60

RAFAEL MADRIGAL, Consul.

CARTAGENA, October 21, 1898.

#### COLON.

It will be seen at a glance, by the tabulated statements forwarded herewith, that the United States heads the list, both in importation and exportation, the summarized figures being as follows:

Importation for half year ending June 30, 1898.

From United States:	
Packages (42,694)	\$146, 222
Lumber (62,675 packages)	9, 732
Lumber (62,675 packages)	11,000
Total	166, 954
From England:	
Packages (18,237)	74,031
Wood 19 074 minors	
Wood (13,974 pieces)	10, 246
Coal (3,128 tons)	1, 563
Total	85, 840
From France:	
Packages (11,053)	82, 529
Wood (6,846 pieces)	850
•	
Total	83, 379
From Germany, 15,648 packages	51, 421
From Italy, 2,851 packages	15, 325
M3 1, 1 , 3 A , 3 TT 1, 3 C1 , 1	

The items imported from the United States in quantities important enough to compete with similar articles brought here from England,

France, etc., are ironware, provisions, and dry goods.

The exportation for half year ending June 30, 1898, was: To United States, \$109,997, principally bananas, ivory, nuts, and cocoanuts; to England, \$28,594, chiefly turtle shells and sarsaparilla; to France, \$3,555, mostly mahogany. It is needless to mention that most of the exportation to the United States is effected by means of American cottoms.

<sup>&</sup>lt;sup>1</sup> In reply to circular of August 5.

Articles exported are entirely free of duty, but there is an import duty of 10 per cent on all kinds of goods that enter this port. This same duty will be increased half as much again after January 1, 1899.

Although the usual currency in all parts of this Republic is paper, the department of Panama enjoys an exemption from the system, legal tender here being silver coin of 0.835 fineness, the equivalent of about 40 cents United States money. The actual exchange is at the rate of 1.50 per cent, say \$2.50 Colombian currency for \$1 United States gold. This excessively high rate has been steadily maintained by the commercial houses that carry on a banking business both here and in Panama, there being no established bank, Government or other, to fix a reasonable rate.

The amount of the public national debt is computed at \$11,600,000, while that of the department is about \$500,000, Colombian silver.

There is a tax on buildings, cattle, etc., of 4 per mil and a poll tax, termed subsidiary personal contribution, of from \$1.20 to \$6; the laborer pays \$1.20 to \$2, the clerk \$4, and the merchant or head of a concern, \$6. The proceeds are intended to be expended for the repairs and the

extension of the public thoroughfares.

The principal streets are lighted by kerosene lamps, but the Government has lately entered into a contract for securing the use of electric light for the purpose. This measure, coupled with the paving of certain parts of the town, and a good sewerage system, both of which are entirely lacking (with the exception of what has been done in that direction by the Panama Railroad Company and the Canal Company), would certainly render Colon a far healthier town, besides facilitating traffic and general circulation.

Good sewerage would carry off the superfluous water that now collects and swamps the land, destroying the continual efforts to keep the

streets in repair.

It is noteworthy that in a place where there is such heavy and at times continuous rainfall, the water supply is exhausted almost within a month after the cessation of rains. It is confined to what is caught in tanks around houses, or what may be brought to Colon from the Frijoles River by the Panama Railroad Company.

The only manufacturing industries here are the aerated-water factory of the late L. W. Hafeman, now continued by his widow, and the liquor

distillery of Mr. Chemisard, a Colombian.

It has not been possible for me to incorporate in this present report any information regarding Bocas Del Toro, as I have been unable to procure it on account of the illness of the consular agent at that post; but I trust to be in a position to do so when next I send a report.

W. W. Cobbs, Consul.

Colon, October 24, 1898.

## PANAMA.1

The markets of the United States receive the greater part of the exports from Panama, which consist of the natural products of the country—hides, deerskins, mother-of-pearl shells, and ivory nuts. England and Germany also get some of the exports, as will be shown by the figures in the statement below, which is the sum total of exports to the countries named for the first six months of this year.

United States.	\$125, 917, 96
England	50, 270, 06
Germany	18, 630. 20

The chief imports of Panama comprise all kinds of dress goods, such as shoes, hats, underclothes, woolen goods, cotton goods, linen goods; hardware; provisions of all kinds; drugs; perfumes; and all kinds of household articles.

I have been unable to get the exact amount of imports for the first half of this year, but whatever hold the United States has on this market can be greatly improved in several ways. At present, the bulk of the imports comes from European countries, and especially is this true of shoes, hats, canned goods, and clothing. American goods, especially in these articles, are very popular here, and, in my opinion, the United States can easily control this trade: but our manufacturers must first learn to pack their goods for export shipments and rough handling. Since the Department has mentioned this subject in the circular requesting this report, I will try and give some idea of the goods coming to and passing through this port, that are packed by factories in the United States. In the first place, the cover is almost always of a frail nature and not able to stand the handling. It is often the case that goods weighing from 800 to 1,000 pounds are packed in boxes of 1-inch boards, and many times, in boxes of a much frailer nature; then it also often happens that goods in smaller and better-made boxes are so packed that they have a large amount of play and shifting room, and the natural result is great breakage and damage. To remedy this, United States firms must first realize the amount of handling the goods are subject to, and pack them to stand this, and not as if they were to be placed on box cars at the factory and not moved until they reached their ultimate destination.

It is true that the merchants of this country calculate on a greater loss from poorly packed goods shipped from the United States than from any other country, and figure on their profits accordingly.

Better packing would not only mean a great decrease in damage, but also in freight rates, in that the goods would occupy less space.

#### EXCHANGE.

The rate is constantly changing, as compared to American gold, and although it is up one day and down the next, the tendency has been toward the depreciation of Colombian money. The rate of exchange at the present time is 150 per cent, while at the beginning of the year, it was about 130 per cent.

#### TRANSPORTATION TO AND FROM PANAMA.

It is well known that the Panama Bailroad runs from Panama to Colon, and is a great highway for the cargo from Europe and New York to the western coast of South America, and vice versa. There is a line of American steamships from San Francisco to Panama and two lines from Panama south to Valparaiso. On the Colon side, there is an American line from New York, and lines running to all parts of Europe.

#### CUSTOM DUTIES AND WHARFAGE DUES.

At present, the customs charge on all goods is 10 per cent. I am told that from January 1, 1899, this will be 15 per cent; but this is not authentic, and I am not sure that it is correct.

There are no wharfage dues here. As has been reported before from this consulate, there is under construction a wharf here that will permit the vessels to lie alongside (at present they are compelled to anchor in open bay), and it is now near its completion. It is at the proposed mouth of the Panama Canal, and this consulate will forward a detailed report when it is in working order.

FRANCIS A. GUDGER, Vice-Consul-General.

PANAMA, October 11, 1898.

## DECLARED EXPORTS, COLOMBIA.

Exports from Colombia to the United States during the four quarters of the year ended June 30, 1898.

# ECUADOR.

Statistics as to the foreign commerce of Ecuador for the year ending December 31, 1897, are taken direct from the official records of the custom house and are tabulated in inclosure herewith.

I regret that it is not possible to make any comparison of these statistics with those of the years immediately preceding 1897. On the 5th of October, 1896, 83 blocks of Guayaquil, including 1,130 houses in the best part of the city, were destroyed by fire. The loss is officially reported to have been \$26,645,000 silver (about \$16,000,000 gold.) All the records of the custom house since 1891 were lost, also all the records of this consulate.

The foreign commerce of Ecuador for the six months ending June 30, 1898, is compiled from official sources by the Revista Comercial, of this city. The principal feature of this year is in the exports of sugar, which have greatly increased the commerce of this country with Chile. This was rendered possible by a strong protective tariff policy, and an efficacious combine between the various producers of cane sugar.

A careful survey of the custom-house statistics, as well as familiarity with the local conditions of trade in Ecuador, show that the United States figures only in a passive sense in the foreign commerce of this country. In certain lines, in which the United States is manifestly beyond the pale of international competition, the Ecuadorian consumer has sought our market; for that reason kerosene, lard, lumber, flour, and the bulkier staples of commerce are imported from the United States in large quantities. This trade originated and has continued from year to year without having cost American merchants any considerable exertion.

Several million dollars' worth of trade are annually lost to the United States because our merchants will not emulate the common-sense English and continental methods of reaching out for a valuable foreign market, especially in those lines of manufactures in which the American excels, but in the export of which energy and enterprise are imperatively required.

That American mercantile interests are so deplorably behind in this country may not have been well understood, but perhaps the table herewith inclosed will prove the truth of my assertions. It will be observed that the seventeen specified articles included in this table represent nearly \$4,500,000, or one-third of the non-American trade of this country, and that from the character of the articles, there is no reason why the American figures should not be considerably more than the \$37,000 represented.

This table is only a partial list; it is thought expedient to await the publication of the first statistical report of the Ecuadorian custom-house, which is expected shortly. This gives all data in minute detail. The figures, however, will demonstrate that a valuable field exists in this country for the immediate introduction of a large number of United States articles, without fear of exciting an unduly sharp competition.

Commercial travelers who visit this country express the opinion that the commercial credit of Ecuador is, generally speaking, in admirable condition; the banks and the principal mercantile houses are as sound and conservative as any in the world; economic conditions here are such that there is no danger of financial panics and crises. In fact, there is an extraordinary assurance of stability and prosperity in the firm and advancing price of cocoa, the chief export staple, and the prospects of soon developing rich mineral and agricultural lands by means of railway facilities.

On the other hand, if American merchants wish to exploit these advantages, they must follow the advice that for many years has been offered them by such institutions as the Bureau of American Republics, the Philadelphia Museum, etc. This advice may be summed up in a few words: Send expert commercial representatives here to study the requirements and conditions of trade. The exhibit of samples, energy, perseverance, and acquiescence in the reasonable demands of local merchants, can only result in success. This is the only manner in which the simple yet exacting tastes of these people can be correctly ascertained. The patterns of goods designed for sale in Ecuador do not vary much from year to year, but when they do, I am assured by local travelers, there is considerable profit to be made in the novelty.

As to trade advertisements and catalogues (always in Spanish, of course), they may be a useful supplement, but their value is nil in comparison with that of a good, active agent.

#### CURRENCY.

Since the beginning of the year, exchange has been maintained at a fixed rate, and considerably in favor of silver. The sucre, the standard silver coin of the country (0.782 ounce), was valued by the United States Treasury July 1, 1898, at 41.8 cents gold. By special arrangement among the banks and business men of Guayaquil, exchange has been kept at 48 cents. The task of thus bolstering up a fictitious value was not unattended by difficulties, and drafts on New York or London were generally very difficult to obtain.

The natural level of exchange is £100 at \$1,360.80; the artificial rate, £100 at \$1,000. The latter rate, however, is expected to become natural and permanent, provided that the project now before Congress, for placing the currency on a gold basis, becomes law. (According to telegraphic reports to day Congress has passed the measure, the gold coin adopted to contain 7.3224 grams gold, or weighing 8.136 grams of 906 fine. equaling \$10 silver.)

The details of this project have been prepared by bankers and merchants of great ability, and there is no doubt that once in force, it will be a complete success and a guaranty against any further fluctuations in the national currency.

The gold basis is the only desideratum in the currency here, as otherwise it is very stable, and will probably never be the cause of any general commercial disorder.

#### RAILWAYS.

It is very much to be hoped that the American syndicate, which, since June, 1897, has held a Government concession, will promptly begin and complete the 400 miles of railway necessary to properly develop the interior of this country. According to cablegrams of recent date, they

are about to begin this important work.

The interior is a plateau of about 20,000 square miles area, having a mean elevation of 8,000 feet above sea level, walled in by two lofty parallel cordilleras, a portion of the Andes, which extend from the northern to the southern limits of Ecuador. The climate and products are those of the temperate zone, and the million of inhabitants that live there are cut off from all communication with the rest of the world on account of primitive transportation facilities. So varied and rich are the natural resources of this hitherto isolated district, according to Humboldt, Boussingault, and a host of modern authorities, that there is a certainty that, the proposed railway once built, Ecuador will develop surprisingly in commercial importance.

## OCEAN TRANSPORTATION.

Before and since the Spanish-American war, the Panama Steamship Company has endeavored to give a weekly service from New York to Colon, instead of three times a month, as formerly. If this service is maintained, the advantage for American commerce is apparent.

Since the expiration of a contract with the Pacific Mail Steamship Company, the Pacific Steam Navigation Company and the Campañia Sud-Americano de Vapores, which hitherto have plied between Panama and South American ports, declared that they would extend their service as far north as San Francisco, Cal. It is reasonably supposed that if they adopt this aggressive measure, the Pacific Mail Steamship Company will retaliate by extending traffic south of Panama. In such event, there will be great benefit conferred on the entire west coast.

MARTIN REINBERG, Vice-Consul-General.

GUAYAQUIL, September 24, 1898.

Imports into Ecuador for the year ending December 31, 1897.

#### SUPPLEMENTARY REPORT.

I wish to supplement my report of September 24, 1898, on the commerce and industries of Ecuador, with data not available at that time.

# QUARANTINE REGULATIONS.

The quarantine regulations of Ecuador are the same as those of Chile ("Reglamento de Sanidad Maritima," decree of February 18, 1895, Imprenta Nacional, Santiago, Chile). No copy is to be had here.

#### Postal rates.

	Silver value.	United States currency.	Grams.	Equiva- lent in ounces.
Letters: Foreign Domestic	<b>\$0.10</b>	\$0.04 .02	15 10	1
Newspapers: Foreign Domestic	. 01 Free.	. 004	30	1
Photographs and samples: Foreign. Domestic. Parcels—Domestic. Legal documents—Foreign.	. 02 . 02 . 04 . 06	. 008 . 008 . 017 . 02	50 50 50 <b>30</b>	18 18 18 19

# MARKING OF GOODS.

Packages of merchandise introduced into Ecuador must bear on the outer covers the marks and numbers corresponding to the invoices, and when the gross weight of a package exceeds 50 kilograms (110 pounds) such weight should be expressed plainly in kilograms.

## CHANGES IN COPYRIGHT LAWS.

A reciprocal copyright convention was entered into in 1898 between France and Ecuador, by which authors and composers secure protection in both countries under the copyrights of either. There are no changes reported in patent laws.

#### MERCHANT MARINE.

The merchant marine of Ecuador in 1898 consisted of the following vessels:

	Number.	Tons.
River steamers	19 229 81	1, 098 3, 334 119
Total	<u>'</u>	4, 651

# LICENSES, ETC.

There are no regulations concerning nor licenses imposed upon commercial travelers. There are no laws which discriminate against or taxes and excises which affect United States trade.

PERRY M. DE LEON, Consul-General.

GUAYAQUIL, February 17, 1899.

# DECLARED EXPORTS, ECUADOR.

Value of exports declared for the United States at the several consular offices in Ecuador during the four quarters of the year ended June 30, 1898.

# FALKLAND ISLANDS.

I send statement of imports and exports of the Falkland Islands for the year ending December 31, 1897. It seems to me that the United States ought to get a part of this trade. Kerosene, an important item of American export, makes a poor showing; but it is, I think, classed with groceries, as I know that a large amount is in use. The official who gave me figures said that while they show a nominal decrease from 1896, there was in reality a substantial increase; that this was the first time that the figures had been correctly set forth.

J. E. ROWEN, Consul.

PORT STANLEY, September 21, 1898.

## SUPPLEMENTARY REPORT.1

The trade of these islands is on the increase. American trade, so far as I can obtain the information, amounts to \$10,000 to \$12,000 per annum, but it is all done through England. The exports largely exceed the imports every year.

In boots and shoes there is no American trade, because our manufacturers do not make the kinds used here. On account of the stones everywhere, the demand is for a boot or shoe with a very heavy sole,

provided with nails.

As to the general trade, it seems to me that if the proper measures were taken, a part might be obtained. I would suggest that the merchants of the United States who deal in the classes of goods needed in these islands make an organization, and open wholesale and retail stores here and at Punta Arenas. They could be under one management to save clerical hire, and then drummers should be sent out. Let an American steamer, say of the Grace Line, come here once in six months, and let the sheep farmers understand that they will have an American market for their wool and an opportunity to exchange for American goods, and I am certain that it would be a success. I will be glad to make the proper investigations as to goods and qualities demanded here. Terra del Fuego is to a large extent settled from here, and the trade which is being developed in that country will assume in the near future vast proportions. We ought to share it. The new population of Terra del Fuego, consisting of the sons and daughters of the old Falkland settlers, makes the trade with these islands of importance. I am certain that American merchants will make a serious mistake if they do not give more attention to the trade here and in Terra del Fuego.

California canned fruit is in large demand here, but it is first sent to England and reshipped. This is a free port to all articles but liquors

and tobacco.

J. E. ROWEN, Consul.

PORT STANLEY, October 13, 1898.

# THE GUIANAS.

In accordance with Department circular of August 5, I inclose herewith my report on the commerce and industries of the Guianas, which compose this consular district, covering, so far as possible, the period

from last report to June 30, 1898.

I am indebted to colonial officials of Demerara for the figures given in the report in advance of the publication of the Blue Book. Such information is not at this time available at the agencies of the consu-It has been impossible to ascertain the special information called for in the circular, concerning cotton textiles. The merchants themselves are unable to give it, and they say only an expert having special knowledge and facilities can do so. If desired, I can at any time cause to be forwarded samples of fabrics to parties interested, for examination.

GEO. H. MOULTON, Consul.

DEMERARA, September 30, 1898.

<sup>&</sup>lt;sup>1</sup> In reply to circular of August 5.

## BRITISH GULANA.

The tendency and volume of trade of this colony is shown in the following comparative statement of imports and exports:

#### IMPORTS.

Countries.	1896-97.	1897-98.	Countries.	1896-97.	1897–98.

sions	16, 603. 79	11, 777. 88		1	

#### EXPORTS.

United Kingdom	Bermuda  Dutch Guiana  Gambia French Guiana  United States of Colombia and other foreign countries.  Spanish possessions.  Newfoundland  Total	2, 320. 01 2, 794. 37	
----------------	--	--------------------------	--

The course of trade is along the same lines and through the same channels as formerly. It will be noted that the aggregate volume of imports to the colony is about \$282,000 less than last year, and that the exports show a decrease in value of \$503,132.84. The United States, however, increased its trade \$201,540.19.

The principal articles imported are flour and other breadstuffs, pickled beef and pork, lard and its compounds, butter, oleo, cheese, fish and preserved meats and fruits, horses, mules, sheep, corn meal, hay, oats, tobacco, cigars and cigarettes, petroleum, tallow candles, lumber, manufactured wood, wood hoops, manufactured paper, staves, soap, pitch, hardware, a little cutlery, a few carriages, and bicycles.

## TRADE.

The following goods ought to find a market here: Willow, rattan or reed chairs and lounges; office furniture, men's furnishings of different grades; hats, wool and straw; cotton textiles of every sort. During the last six months, there were imported from the United States 220 bicycles, valued at \$8,310.70; from England 131, valued at \$6,745; from Germany 2, valued at \$99; total, \$15,154.70.

The market is now pretty well stocked, but the trade is susceptible of moderate development. The superior features of American goods cause favorable comment.

Each succeeding year shows an improvement in the rice industry, and manufacturers of machinery would do well to watch its development.

The question relative to the best means of developing American

trade has already been thrashed threadbare. Catalogues and correspondence will avail little. Inducements must be offered to the market sufficient to outweigh every other business consideration given by competing countries. In order to achieve success, the territory must be invaded and competition paralyzed.

### SHIPPING.

The increased carrying capacity of steamers over sailing vessels, and the punctuality with which they can deliver goods, have resulted in some beneficial changes in the conditions of trade. Formerly, the trade of the United States was handled by two or three houses; now, five times as many importers are consignees of general cargoes. This distribution of business is advantageous. Coincident therewith is the revival of the system of private bonded warehouses, which insures a rapid discharge of cargo, and saves interest and storage rent. At present, there are 14 such licensed warehouses in the city of Georgetown.

Nationality, number, and tonnage of vessels that were entered at this port during the year 1897-98.

#### RAILWAYS.

Railway transportation in the colony remains unchanged. The line alluded to in last year's report 1 has not been completed.

<sup>&</sup>lt;sup>1</sup>Commercial Relations, 1896–97, Vol. I.

## TARIFF CHANGES.

The following changes in the tariff rates were made on March 12, 1898: Biscuits, sweetened or sugared, raised from one-half to 5 cents per pound; brimstone and sulphur, raised from 10 per cent ad valorem to 1 cent per pound; clapboards, reduced from \$5 per 1,000 running feet to \$5 per 1,000 feet, board measure; confectionery, raised from 5 to 7 cents per pound; fish, pickled, "and all other sorts, including trout," raised from 25 to 50 cents per barrel of 200 pounds; fruits, dried, raised from 10 per cent ad valorem to 5 cents per pound; garlic, raised from one-fourth to one half cent per pound; malt liquor, in wood, raised from 12 to 16 cents per gallon; malt liquor, in bottles, raised from 30 to 40 cents per dozen reputed quarts; malt liquor, in bottles, raised from 15 to 20 cents per dozen reputed pints; matches of all kinds, raised from 50 to 60 cents per 14,400 matches; nuts (used, in the opinion of the comptroller, as fruit), raised from 10 per cent ad valorem to one-half cent per pound; onions, taken from free list and placed on specific at one-half cent per pound; salt, admitted by the comptroller as fine, per 200 pounds, \$1, raised from free list to specific; salt, coarse, in bulk, raised from free to specific list, 75 cents per 200 pounds; soap and soap powders, perfumery, fancy and toilet, raised from 2 to 4 cents per pound; spices, betel or areca nut, pepper and all seeds, except garden seeds, raised from 1 to 4 cents per pound; spirits, strong waters, etc., raised from \$3 to \$3.50 per proof gallon; sweetened spirits, liquers, bitters, etc. (not to be tested), raised from \$4 to \$4.50 per gallon; tea, raised from 12 to 16 cents per pound; tobacco, leaf, packages not less than 800 pounds, containing 10 per cent or more moisture, reduced from 60 to 40 cents per pound; tobacco, leaf, packages not less than 800 pounds, containing less than 10 per cent of moisture, reduced from 75 to 60 cents per pound; tobacco, leaf, packages less than 800 pounds, containing 10 per cent or more of moisture, reduced from 75 to 60 cents per pound; tobacco, leaf, packages less than 800 pounds, containing less than 10 per cent of moisture, reduced from 90 to 80 cents per pound; waters, aerated or mineral, raised from 8 to 16 cents per dozen pints; wine of all other descriptions, in wood, raised from 88 cents to \$1 per gallon; wine of all other descriptions, in bottles, raised from \$2.40 to \$3 per dozen reputed quarts; wine of all other descriptions, in bottles, raised from \$1.20 to \$1.50 per dozen reputed pints; chemicals and other substances which the comptroller of customs is satisfied are imported for the purification of water, added to the free list; under machinery, "trucks for mining purposes" added to free list.

#### COMMERCIAL TRAVELERS.

No license is imposed upon commercial travelers and no special regulations affect them.

#### COLONIAL EXPORTS.

The amount of timber and cocoa exported has fallen off, as compared with last year. There was an increase of 170,000 pounds of balata during the same period. During the year ended June 30, 1898, the gold exported amounted to 117,195 ounces, and for the same period in 1897, 127,521 ounces were exported, showing a decrease for 1898 of 10,326 ounces.

## DUTCH GUIANA.

Consular Agent Dayo, of Paramaribo, reports that imports from the United States consist mostly of foodstuffs. Prices ruled higher than normal during the early period of the war with Spain, but these conditions were of brief duration.

Manufactured goods, continues the agent, come mostly from Europe, principally England and Germany, as these countries understand the requirements of the market and govern themselves accordingly. He thinks competent agents should be sent out by our business men, and advises that packing of goods for that market be studied, claiming that our merchants do not understand how to economize space. The Europeans are perfect in that respect. Commercial travelers from Germany and England keep in close touch with the business community of Paramaribo, while the reverse is true of American travelers. One is seldom seen there.

Something may be done in the way of machinery for gold mining, and for the preparation of coffee for market, the coffee grown being of a kind difficult to prepare by hand. The machinery should be suitable for both large and small quantities, and should not be expensive.

Once a year, the Government invites bids for the supply of steamer coal—2,500 to 3,000 tons per annum. The English have heretofore secured the contract. The kind used is Cardiff coal, double screened.

#### EXPORTS.

These consist of cocoa, balata, sugar, coffee, timber, rum, and gold. The cocoa goes principally to the United States. During the last six months, the crop was 17,000 bags as against 18,000 for the same period in 1897. A bag contains about 110 kilos (242 pounds). Balata goes mostly to Holland, sugar to the United States. The coffee industry is increasing, the product going to Holland. Timber is sent to the Netherlands, rum to England, and gold to various countries, mostly to the Netherlands.

## HARBOR CHARGES, TAXES, ETC.

The custom-house, wharfage, and light dues have been abolished. The expense of any vessel entering and clearing from the port is only \$5. The Government is extending the custom-house wharf, so that better facilities for discharging and loading cargoes will be provided.

A bill is before the colonial assembly to change the tax on incomes and business licenses, which may affect American interests should it pass. A change is also proposed in the gold-mining law.

## COLONIAL IMPROVEMENTS.

Concessions have been applied for, to put in operation street cars and electric lights. A loan of \$1,200,000 has been obtained for drainage and general improvements in the colony.

#### TRANSPORTATION.

The Dutch line has increased its fleet plying between Paramaribo and New York, via West Indian ports. A vessel leaves Paramaribo twice a month. The Royal English mail visits the port every two weeks, with connections at Barbados for New York, Europe, and West Indies. The French mail calls once a month from Demerara and the Islands. A

Government steamer plies between Paramaribo and Demerara, leaving Paramaribo Monday and returning Friday of each week, carrying mails, cargo, and passengers.

# PUBLIC HEALTH AND IMMIGRATION.

The health of the colony is good and the death rate very low.

In addition to the East Indian coolies, immigrants from the Island of Java are being introduced by the Government to work on the sugar estates.

## FRENCH GUIANA.

Placer gold mining is the only industry in the colony and gold the only export. The population is 25,000, exclusive of 8,000 convicts. The population of Cayenne is about 11,000. It is one of the cleanest and best drained cities in this part of the world. Thrift is seen on every hand, and there are no beggars in the city. French is exclusively spoken. France enjoys a preferential tariff rate, yet the United States has a monopoly of trade in flour, salt beef, pork, lard and its compounds, oleo, butter, corn, hay, oats, lumber, petroleum, and sewing machines. Food stuffs from the United States appear to possess qualities sufficient to overcome competition. Their resistance to the prevaling heat and moisture, and the excellence of the packing, are their special merits.

Consular Agent Lelanne, of Cayenne, states that United States food products are the only ones which can be transported to the gold diggings in the interior without spoiling. He reports a new process of dragging the alluvial deposits of the colony, which seems to be a success, as it saves all the gold. Twelve men with one of these drags can wash 75 to 100 tons of dirt per day, the gold being collected by copper amalgamating plates.

# PARAGUAY.

The following report covers matters up to date, except some of the statistics. Figures for 1898 are not yet obtainable, and those for 1897 have not as yet been published. By special permission of the authorities, I have myself copied nearly all the statistics here presented.

Paraguay has an area of about 98,000 square miles, and a population of 600,000. It is divided into 32 counties, governed by chiefs and jus-

tices of peace.

The senators represent 12,000 people each, and the representatives 6,000. They receive £200 a year. The President is General Egusquiza, whose salary is about £1,900 per annum. The vice-president receives £960, and the ministers £600 each.

Asuncion has about 47,000 people. It is the capital of the country, and the chief port. Villa Rica, the next place of importance, is an inland town with about 20,000 people. Concepcion has about 10,000.

# BEVENUE.

The revenue of the Government in 1895 and 1896 was \$5,100,495, and in 1896 and 1897, was increased to about \$5,462,475. The amount avail-

able for public service is about \$3,562,560. The public debt in 1897 was: Internal (paper), \$9,846,278.79; external (gold), \$31,815,680.04. The income of the Government in 1897 was \$6,423,687.53.

# PUBLIC INSTITUTIONS, REGULATIONS, ETC.

There are no asylums for lunatics or crazy people; they are sometimes put in the jail. Those who are unable to maintain themselves are allowed to continue begging, but those who are able to work and continue to molest the public, are put in the jail.

Orphans are taken care of in asylums. There is no institution for

the support of superannuated laborers, etc.

The laws of Paraguay on the subject of drunkenness are very good. Anyone found drunk will be fined \$10, paper, and put in jail from one to ten days. Anyone who sells drinks to one manifestly drunk will be charged from \$5 to \$10 the first time, and from \$10 to \$15 the second. Anyone who sells to minors or persons under 16 years of age will be fined \$5 to \$10 the first time, and \$10 to \$15 the second, and will be put under arrest for five or ten days, if he sells enough to the minor to make him drunk.

Except hotels, restaurants, barber shops, drug stores, bakeries, cafés, etc., all business houses are closed from 10 a.m. to 6 p.m. on all festival or feast days. Business commences very early, at 6 a.m., and lasts until 11 a.m. It then closes; begins again at 2.30 p.m., and continues

until 5 or 8 p. m.

#### EDUCATION.

Paraguay is making commendable strides in the line of education. As President Egusquiza remarked in his last message to Congress, one-third of the Government income is devoted to this purpose. There are about 390 schools, public and private, in the Republic, with some 2,500 pupils and 700 teachers. The largest schools are situated in Asuncion.

The National University, which prepares young men in all lines, professional or business, has about 700 pupils. Much attention is paid to business training and the higher branches of education. There is also a large school of arts and industries, conducted by the priests, and doing good work teaching printing, bookmaking, binding, carpentry, shoemaking, bookkeeping, etc. It is supported largely by charity, and many wealthy and prominent people contribute to it.

The schools for boys and girls are usually separate. In 1886, a school was founded affording opportunities of coeducation, but in 1894, it was converted into one for girls, being from that date under the Woman's Foreign Missionary Society of the Methodist Episcopal Church of America. This school had 75 pupils last year and 82 this.

There is also a Protestant school for boys with about 67 pupils, some 38 being Paraguayans and 29 foreigners. In the girls' school, 33 are

Paraguayans and 21 foreigners.

Another Protestant school is under the auspices of the German residents in Paraguay. The native schools are many, especially in Asuncion. Almost every corner or square has a schoolhouse, and much interest seems manifested in proper training of the young. There is a good opening here for books, printed, of course, in Spanish. There is also a large school devoted to the study of agriculture, which is doing practical work.

#### MOVEMENTS OF VESSELS.

In the year 1897, the following vessels entered the port of Asuncion:

Nationality.	Number.	Tonnage.	Passen- gers.
Argentine Uruguayan Brasilian National	21	112, 014 6, 010 14, 401 170	2, <b>9</b> 15 104 517 21
Total	97	182, 595	3, 557

# The clearances were:

Nationality.	Number.	Tonnage.	Passen- gers.
Argentine. Uruguayan Brazilian National	20 40	2, 304 3, 800 2, 021 8	4, 801 490 1, 198 27
Total	358	8, 188	6, 511

In 1896, 666 vessels entered the port of Asuncion with 176,638 tonnage, and 613 with 147,640 tonnage cleared for foreign ports. The boats are usually constructed for ocean traffic, although flat bottoms are more convenient. Allow me here to repeat a part of my report of December 31, 1897,¹ and urge upon the attention of American capitalists the profit of putting flat-bottom Mississippi River boats on the thriving River Plate. When the river is high, the boats now in use are all right, but when low, mail and commerce are delayed.

The boats plying from Buenos Ayres to Asuncion are very well equipped, good fare and accommodations being provided. There are three regular lines, leaving Wednesdays and Sundays. They do a good business.

## COMMERCE.

The exportation has been greater than in 1896, while a slight decrease in importation is noticeable:

Year.	Importations (gold).	Exportations (paper).
1895	\$2, 462, 050 2, 786, 000 2, 211, 465	\$12, 728, 627 12, 292, 000 14, 467, 771

The principal articles of export are hay, cotton, nuts, pineapples, rice, horns, bananas, coffee, bark of carabay, etc., barley, wax, hair, cocoa, skins, cuttings of hides, bones, woods, corn, peanuts, mandioca, cups for maté (tea), molasses, honey, oranges, palms, santa and rosewood, Irish potatoes, grindstones, feathers, dyewoods, medicine roots, watermelons, silk, vegetables, tobacco, bamboos, tomatoes, grains, yerba, ibira, and sarsaparilla.

The following are manufactured in Paraguay: Oil, extract of orange flowers, alcohol, upholstery, starch, slippers, counters and shelves,

sawdust, drinks (ginger ale, etc.), baskets, rum, hay, charcoal, sifters, cigars, cigarettes, curves and knees (wood), sweets, ties (for railroads), brooms, flour, macaroni, matches, biscuits, crackers, fats, soap, bricks, liquors, lucro (pounded corn), saddles, combs, posts, cheese, spokes (of wheels), wheels, chairs, floorings, boards, wooden pegs or plugs, tiles (for roofing), bran (of mandioca), candles, vinegar, and wines in small quantities.

Of hides, one house (Christians Heisecke) alone exported 60,000 in

1897. About 200,000 hides were exported last year.

Résumé of the importations and exportations from the custom-houses of Paraguay in 1897.

	Imports.				Exports.			
houses. With 1	Ordinary articles.		Articles in pack- ages.		Ordinary articles.		Articles in packages.

### DUTIES.

During the year 1897, duties received by the custom-houses of the Republic of Paraguay amounted to \$3,916,651.35 from imports and \$1,033,660 from exports, distributed as follows:

Duties.	Amount (pa- per).	Duties.	Amount (pa- per).
Duties accruing to the Government (gold) Additional 5 per cent (gold) Additional 4 per cent (paper money) Additional 8 per cent (paper money) Duties from packages Duties of storage rent in customhouse Duties from unloading vessels, etc. Duties, interior (stamps, etc.)	\$2, 981, 938, 69 561, 744, 54 68, 697, 36 51, 522, 85 38, 686, 44 7, 352, 41 91, 154, 89 116, 555, 17	Duties from packages	\$631.07 427, 163.82 260, 087.00 5, 287.44 200.00 518.87 186, 184.78 203, 587.02

## CENTRAL COMMERCIAL.

This organization was founded May 7, 1898, and is the only one in Paraguay. It has for its objects to establish telegraphic service which will permit comparison of quotations and of current prices of foreign products, with those of Paraguay; to name correspondents to transmit information and general data; to collect all statistics as to the

commerce and resources of the country; to form a list of prices current, which will be under the care of a special commission, and to employ means for settlement of debts, etc., by arbitration or in any way that will save time and expense.

The supervising commission is composed of 6 wholesale merchants, 3 owners of industries, 3 retail merchants, 1 broker, 1 maritime agent, 1 insurance agent, 1 banker or chief of a money-changing house, and 2

other members, farmers or the like.

This organization promises to be of great service to trade in Paraguay. It is an association of business men something on the order of our exchanges, and would gladly communicate with all American exchanges.

I submit translation of a letter from the secretary in reply to my

inquiry for commercial information:

ASUNCION, August 1, 1898.

Mr. John Ruffin, Consul.

SIR: It gives me pleasure to give you a list of the articles principally exported from Paraguay, the natural products and fruits, as well as the manufactures, most of which are sent to Brazil.

Importation has been varied. I send you a complete list of all the articles imported into the country, with the duties, etc., imposed.<sup>2</sup>

The imports come from Germany, Spain, France, England, etc.

Yours, truly,

NARCISO M. ACURA.

The following is a translation of articles similar to those which appear in the daily papers:

Beef for consumption was sold to-day at \$95 [paper] per head. Corn for eating purposes sold at \$3.20 [paper] per aroba [25 pounds]. Mr. John N. Ruffin, consul of the United States of America, sent various business periodicals, catalogues, etc., to the reading saloon.

The directors will meet August 5.

Money to-day quoted as follows: Gold, 761; Uraguayan dollar, 818; Argentine paper, 274; Brazilian, 230.

That is, \$1 gold is equal to \$7.61 of Paraguyan paper. I bespeak for this organization the attention of American business men. dent is Mr. A. Plate, general manager of the Mercantile Bank.

## Post-office movement in 1897.

	Letters.	Printed matter.	Cards.	Official.	Regis- tered.	Pack- ages.	Total.
City service	2, 625	11, 981	2, 452	858	2		17, 918

Total	400, 661	390, 572	50, 002	57, 901	40, 722	1, 119	934, 977

There are about ninety-five or one hundred post-offices in the Republic. The foreign mail comes by boat about twice a week.

<sup>2</sup> Already stated.

<sup>&</sup>lt;sup>1</sup> Enumerated under the head of "Commerce" above.

## Telegrams.

	Telegrams.	Words.
Exterior: Sent Received	17, 690 19, 583	334, 665 726, 704
Interior: Sent	7, 755 7, <b>936</b>	113, 657 122, 397
Total	52, 964	1, 297, 417

The telegraph connects Paraguay with Corrientes, in the Argentine Republic, about 360 miles away. From Corrientes, the line runs to Buenos Ayres, and Paraguay is thus connected with the outside world. Occasionally, the line gets broken, but the service is generally prompt and regular.

# AGRICULTURE.

The following table shows the distribution of cultivation in 1897:

	Linos.1
Tobacco	582, 254
Sugar cane	670, 762
Rice	245, 959
Corn	2, 365, 491
Mandioca.	2, 489, 161
Beans	962, 740
Garlic and onions	85, 358
Irish and sweet potatoes	116, 286
Coffee plants	343, 407
Peanuts	406, 610
Cotton	120, 899
Green peas	62, 677
Beans	53, 134
	,

Paraguayan soil is among the best and most productive in South America. Very little labor is necessary to bring forth a bounteous harvest. The extensive plains afford opportunities for cattle raising. There is always a ready sale for beef and live stock; in fact, this is the staple wealth of the country. The number of cattle, fowl, etc., may be stated as follows:

Cattle (horned), cows, etc	1, 744, 000
Horses	182, 833
Mules Sheep Goats	13, 660
Sheep	117, 248
Goats	49, 667
Asses	9, 058
Hogs	35, 159
A8808	900, 754

The cattle are simply marked and turned out into the big ranches to feed themselves. The ranches are inclosed by wire fences, and in this line, there is a good opening for imports from the United States.

<sup>1 1</sup> lino = 250 feet.

#### CRIME.

The following table will show the security of business, and how free, comparatively speaking, Paraguay is from store robbery, burglary, etc.:

Nationality.	Homi- cide.	Bank- rupts.	Theft of cattle.	Rob- bers.	Bur- glars.	For infliction of severe wounds	_	Forgers.	Other causes.

# BANKRUPTCY LAW, ETC.

To those interested in the mercantile laws of Paraguay, the following may be of service:

(1) To cease to pay one's debts constitutes the condition or cause of

bankruptcy.

(2) Only merchants, or companies acting as such, are susceptible of bankruptcy. There is a mercantile registry, in which the names of all merchants should be inscribed. The advantage of registering is that the merchant's books, kept according to law, are regarded as proof against the debtor. Whether registered or not, the merchant can become a bankrupt.

(3) A merchant can only be declared bankrupt by the commercial court, there being three courts: The commercial (covering commerce, freight, etc.), civil, and criminal. The judge of the commercial court is Dr. Legal. The civil court contains two departments, the judges being Drs. Gonzales and Bobadilla. These hold their terms of office, not for

life, but with the term of the President, four years.

(4) Request for declaration of bankruptcy must be solicited from the

commercial judge by the creditors or by the bankrupt himself.

(5) There are three classes of bankruptcy: Casual, culpable, and fraudulent. The casual is caused by such accidents as fire, etc. The culpable is when books are out of order, when one has not registered as a merchant, etc. Fraudulent is the same as elsewhere.

(6) Whenever one is bankrupt he is immediately sent to jail, whereupon the commercial court decides under what kind of bankruptcy he

is to be classed. He can be released if he obtains security.

(7) Reinstatement in a culpable case can be effected only after the bankrupt has paid his bills to the creditors. In case of casualty, reinstatement can be promptly secured by a decree of the judge of the commercial court. The bankrupt in a fraudulent case goes to prison for a term of years. All debts of bankrupts must be cleared or paid before they can reenter business.

(8) The legal rate of interest is 6 per cent in absence of agreement, in all matters not commercial, the mercantile rate being 12 per cent; but if a contract is made to pay 20 or 25 per cent, the law will not intervene

#### OPENINGS FOR INVESTMENT.

For persons having capital, Paraguay offers good inducements in the line of interest. Of course, here and elsewhere care should be given to the proper arrangements of papers, securities, etc.

#### IMMIGRATION.

The Government has very liberal immigration laws, and offers every possible inducement to immigrants. In correction of an impression that the Government will pay passage from a European or American country to Paraguay, I wish to say that the Government only pays the immigrant's passage from Buenos Ayres, Argentine Republic; maintains him five days in the immigrant hotel, then pays his passage, including luggage, agricultural implements, and household goods (which enter free of duty), to the colony or spot of his choice. The Government grants to each adult immigrant 60 cents, paper, a day (to children about 30 cents) for three months, and if necessary, for three months more.

For fuller information, any person can communicate with Mr. Santos, chief of the bureau of immigration, or the minister of foreign affairs, Mr. José S. Decond, both of whom speak English readily.

For the information of many who write here inquiring about the colonies, and for those business men who desire some acquaintance with the small towns near Asuncion, I submit the following statistics of immigrants for the year 1897:

Nationality.	Men.	Women.	Boys.	Girls.	Total.
English German French (talian A ustrian Spanish Argentine Syavise Hollander Uruguayan American	28 17 10 39 4 10 7 8 2 1	19 5 4 2 2 2 2 6	12 1 1 2 3 8 15 1	3 5 2 1 1 2 18	65 28 37 44 10 17 46 9
Total	127	41	39	32	231

Occupation.	Number.	Occupation.	Number.
Agriculturists. Day laborers Teachers Bookbinders. Carpenters Machinists Pharmaciats.	14 4 2 4 2	Shoemakers Tinners Cooks Educators  Total Without professions	137
Filteramiths	1 2	Children	239

Of these 239, 90 paid their own fares, 149 had their passages given by the Government, and all had expenses paid at the immigrant hotel, amounting to \$500, gold.

# CONDITION OF THE COLONIES.

The following statistics are for the year 1897:

#### COLONIA COSMOS.

This is an English colony. There are some 70 plots of cultivated land. They are planted in corn, mandioca, Irish potatoes, rice, tobacco, peanuts, and sugar cane. The number of plants, cattle, etc., is as follows:

Orange plants	2, 320
Banana plants.	1, 300
Coffee plants	
Yerba plants	
Fruit-tree plants	
Horned cattle	
Horses	21
Hogs	21
Fowls	360

The Government of Paraguay ceased to pay fares from Europe and other points, because immigrants availed themselves of the passage to Buenos Ayres and there stopped.

#### RAILROADS.

The Central Paraguayan Railway has 41 coaches, 158 cars, and 15 engines.

Passengers carried from November 1, 1896, to October 31, 1897.

The grand total of the traffic of the railroad for the months commencing with November, 1896, and ending with April, 1897: Tons carried, 35,412; packages, telegrams, animals, etc., 95,624.

Total income from freight and passenger traffic, \$4,444,311.44 paper, or \$650,000 gold.

It is to be noted that this railroad is only 155 miles long and is the oldest in South America. It is now owned by an English company.

# BUSINESS CONDITIONS.

A man who represents some of the largest business houses in South America that handle United States goods, says the exportations and importations which have passed through his house (Henry Plate, Asuncion, Paraguay) from 1893 to 1897, have amounted to over \$1,000,000 gold, and that during this period of four years, only \$6,000 gold has been lost by bankruptey and other causes.

JOHN N. RUFFIN, Consul.

ASUNCION, August 1, 1898.

# URUGUAY.

# EXPORTS AND IMPORTS.

The department of statistics has given out the report of exports and imports of Uruguay for the first half of 1898, from January 1 to June 30, inclusive. In connection therewith are presented comparisons with the same periods of the years 1896 and 1897.

Exports and imports, January 1 to June 30, 1896, 1897, and 1898.

#### IMPORTS.

Drinks in general. Comestibles, cereals, and spices Tobaccos and eigars. Stuffs and woven goods Made clothing. Raw material and machinery Various articles. Live stock	148, 157 2, 464, 515 849, 754	\$1, 263, 627 1, 836, 918 92, 612 1, 633, 815 439, 182 2, 445, 036 1, 082, 683 477, 332	\$1, 475, 971 2, 287, 598 111, 521 2, 587, 406 743, 541 8, 136, 235 1, 314, 096 1, 658, 009
Total	18, 485, 782	9, 271, 205	13, 246, 372

The year 1897 was marked by civil war, and hence the greatly reduced total for the period named. It will be seen that the total of commercial transactions for the half year of 1898 shows an increase of \$4,717,000 over that of 1897, which brings this period up to an average

but little below that of previous years, in which this showing was made:

Year.	Amount.	Year.	Amount.
1893	\$26, 159, 098	1896.	\$32, 577, 840
1894	34, 021, 520	1897.	26, 797, 175
1895	32, 667, 381	1898.	31, 514, 898

Attention is directed to the steadily decreasing export of slaughterhouse products. Examination of the official reports for the past five years, for the first half of each year, shows this result:

Year.	Amount.	Decrease.
1894 1895 1896 1897 1897	\$18, 772, 494 17, 346, 386 17, 090, 216 16, 017, 486 14, 922, 467	\$1, 426, 108 256, 170 1, 072, 730 1, 095, 019

It is only fair to say that the war with Spain has been an agent in this great decrease, but this does not altogether serve as an explanation. It is found that American products are steadily supplanting competitors in the Cuban and Brazilian markets, where much of the export from Uruguay goes. In the civil war of 1897, there was no great destruction of herds, so that the decrease can not be charged to this.

In purely agricultural products—wheat and corn—there has been a steady, but sure, increase, the exports for the first half of 1898 amounting to \$2,958,412, the largest in the history of the Republic. Examination shows that every year, more and more land is brought under cultivation along the lines of railway, farm products having proven more remunerative than cattle or sheep. Especially has this been the case in small "estancias," where the cost of operation in stock has been too high, while with grain, with the good prices prevailing, profit has followed, save in the "locust" years of 1896 and 1897. A steady increase in wheat and corn for export may be safely counted upon; the locust plague alone will prevent it.

# VITAL STATISTICS.

The direction general of the civil registration has issued its reports for 1897, showing the number of marriages, births, deaths, and other facts touching the population of the Republic. I condense the tables as follows:

#### MARRIAGES.

Recorded marriages in 1896 Recorded marriages in 1897

The population of the Republic is now calculated at 824,512, on a census taken several years ago, deemed to be substantially correct.

ALBERT W. SWALM, Consul.

MONTEVIDEO, August 31, 1898.

# SUPPLEMENTARY REPORT.

#### COMMERCIAL CONDITIONS OF URUGUAY.

Pursuant to instructions and consular regulations, a brief report on commercial conditions of Uruguay and their relations to the United States is herewith submitted.

In a preliminary way, it should be stated that business in the Republic has been seriously interfered with by the political conditions of the past two years. On August 25, 1897, the then President, Idiarte Borda, was "removed" by assassination. Don Juan Lindolfo Cuestas, president of the senate, assumed executive power in accordance with the constitution, but not at the wish of congress. This led to bickering, and finally, on February 17, 1898, congress was dissolved, President Cuestas assumed full powers, appointed a council of state of 88 representative men, and the Government proceeded in that way. On July 4, 1898, political events culminated in an attempt at revolution by the mutiny of some of the military forces in the city district, in quelling which many were killed and wounded. From February to July, there was constant unrest and turmoil, seriously affecting busi-

ness conditions. Elections for members of congress will be held in November, and that body elects the President, who will be inaugurated in March, 1899, for a term of four years, and if these events can be accomplished in a peaceful way, American trade will be greatly benefited

thereby.

No official statistics for the first half of 1898 are available touching imports from the United States to Uruguay, but it is known that the imports are larger in lumber, oil, agricultural implements, and sundry items, than the exports to our ports. The total exports were \$2,227,840.35, which included the two quarters of 1898, as follows: Third quarter, \$596,922.17; fourth quarter, \$330,100.34; a total of \$927,022.51. Of this amount, hides represented an invoice value of \$677,818.58; bones, horsehair, glue stock, wool, ostrich feathers, meat products, and whale catchings make up the remainder. No wool was sent out in the last quarter.

Careful inquiry among the importing houses, in the lines of staple cotton goods, agricultural implements, household hardware, lamps, revolvers, and arms, shows a small increase in orders, but the uncertain political conditions impede trade. In lumber, of course, there is no competitor with the United States. In refined kerosene, some Baltic oil has been imported, but its quality is adversely commented on in

comparison with the American grades sold in this market.

In my report of October 3,1 the success of American coal in River Plate

ports is fully treated.

United States bicycles are slowly making their way here, and will hold their own. There is competition, that can be overcome, with a very cheap foreign machine. When an American bicycle depot is established here, such as foreign machines have, the trade will develop in a much more satisfactory way. In its practical work, the United States bicycle has been found satisfactory in this section of South America, and holds a higher reputation than foreign makes.

The total of cattle and meat products exported from Uruguay for the first half of 1898 is given out officially at \$14,922,467, which, of course, covers the main yield and exports for the year. The unofficial reports for the weeks since June 30 show a great loss in value and volume. These products cover all hides, skins, bones, horns, hoofs, jerked beef,

meat extracts—in fact all that emanates from slaughterhouses.

In this connection, I can not forbear again mentioning the item of tasajo, or jerked beef. The annual value of this product for the last seven years averages \$4,000,000, gold. There has been exported to Cuba every year some 3,000 tons of this jerked beef, or the product of about 33,000 head of cattle. A very considerable amount has also found its way to Porto Rico, but the changed political conditions of these two islands, it is expected by the slaughterhouse men here, will cause an opening for American products in those markets. It is frankly stated that the American method of meat curing is superior in its way, and that while tasajo, or jerked beef, may not be presented there in the shape in which it comes from this market, meat will be offered in a more palatable form, of much more value as a food and at less cost. It seems that the Spanish customs tariffs on this product have been influenced by the producers of jerked beef, and have operated against the barreled or canvased product from the United States. In the natural order of events, it is expected by producers here that matters will be adjusted on a more even scale, which, with the superior quality

<sup>&</sup>lt;sup>1</sup>Advance Sheets, No. 303, December 20, 1898; Consular Reports, No. 222, March, 1899.

of the American product, and the nearness of the market to the source of supply, will give it wholly to American producers. This will leave Brazil as the only customer for this product of Uruguay. Comment is now made in the public press on the absence of all treaties between Uruguay with the United States, by which this product of Uruguay may find a favored entrance, as being an article not made by any other

cattle-producing country in the world in a large way.

Canned products of the United States, such as fruits, salmon, clams, and lobster, evaporated fruits, now appear in this market in greater quantities than last year. The very heavy duty, however, will prevent any general use, as the retail price is above the reach of the masses. When canned peaches and apples are held at from 40 to 60 cents, gold, per can, retail, about 90 per cent of all tables will not know them. Since 78 per cent of the funds necessary for Government finances come from duties collected at the custom-houses, and there is a population of only 850,000 to supply, the reason for high and practically prohibitive duties will be apparent.

United States manufacturers are winning their way slowly but surely in Uruguay. My predecessors in consular work here have given much useful information as to the local trade, and it has borne good results, but the establishment of a distinctively American warehouse would be one of the most successful ventures in the interest of our trade that could be named. I speak from practical observation here, where the French and Germans, as well as the English, show their handiwork of every kind and character, ready to supply the needs of the

population.

ALBERT W. SWALM, Consul.

MONTEVIDEO, October 14, 1898.

### MARACAIBO.

I forward herewith report on the commercial relations of this consular district, for the first six months of the year 1898.

I regret to say that no pleasing news can be given; the civil war in Venezuela, the war between the United States and Spain, the small-pox epidemic all over the country, and the unprecedented low prices of the main staple, coffee, had the most depressing influence upon trade. The withdrawal of regular steamship communication had also a very bad effect.

The quantity of coffee brought to market decreased during the civil war, as most of the river and lake steamers were used by the Government. These drawbacks are now over, peace is restored, and were it not for the low coffee prices, better times could be hoped for.

Money has been very scarce and could not be obtained to transact business. Of course, the very large houses have not suffered so much, but many of the smaller firms have felt the stringency of the money market.

It is true that there is a bank at Maracaibo, but this institution has only a limited capital and lends money chiefly on real estate. When it is considered that about 500,000 quintals (1,102,300 pounds) of coffee are shipped yearly from this consular district, not counting the great trade in cacao, hides, skins, and other products, it seems that three to four large banking houses could do a permanent and lucrative business here; but strange to say, the locality has not yet attracted the attention of banking institutions abroad.

In many of my reports I have spoken of the natural riches of Venezuela, and especially of the western part. There are lakes of asphalt and all kinds of minerals in abundance, the most valuable woods, and fertile soil.

A few miles from Maracaibo, on the other side of the lake, are lands on which for thirty years sugar cane has given satisfactory returns without being replanted. Corn gives two rich crops a year on uncultivated lands. Rice, which is mostly imported, can be cultivated with good success.

The shores of the large Lake of Maracaibo are well adapted for cocoatree plantations, as well as for banana cultivation, yet hardly anything is done in these lines, as the people have not the means to develop the riches of the country.

Cotton can be planted with success, the soil being especially adapted to produce a long, silky fiber. To-day, no attention is paid to this lucrative industry; all cotton goods are imported from Europe and the United States. All that is needed is foreign capital to open the many branches of industry.

Venezuela has a gold standard and fluctuations of the money market are little known. Under the government of Gen. Ignacio Andrade, now

President of Venezuela, this country is bound to prosper, and I am convinced that he would most gladly assist any American capitalist or

manufacturer willing to start enterprises.

I have lately received many letters from parties engaged in the raising of cattle, asking information about this industry in Venezuela and if I believe this country suitable for stock raising. From my long residence here and personal observation, I can fully recommend this country for such purposes. Abundance of fine grazing lands can be had for very low prices, in localities suitable for foreigners, among kind and peaceable people. What is required for success in this industry is to take personal care of the business, and not leave it in the hands of irresponsible persons. I would also recommend the raising of goats, which give large returns; the meat can be salted, dried, and sold to the people of the Cordillera, and the skins will find a ready market in the United States.

There is only one new industry established here, a shoe factory with

American machinery.

I would have been pleased to forward statistics of imports into this consular district, but I can not obtain them; they are sent at once by the custom-house authorities to Caracas.

E. H. PLUMACHER, Consul.

MARACAIBO, October 13, 1898.

#### SUPPLEMENTARY REPORT.

I submit a report upon the commercial condition of this consular district, and I beg to refer to the inclosed statistical report for the year ending December, 1898, giving the principal articles shipped during the year to the United States:

#### COFFEE.

The quantity of coffee shipped from this port has greatly increased, notwithstanding internal difficulties and the civil war in Venezuela during the last year, but the price is to-day lower than during the last twenty years.

In 1896, there was shipped through this consular office 51,499,398

pounds of coffee, at a declared value of \$7,984,959.43, gold.

In 1897, there went with consular invoices to the United States 52,503,520 pounds, at a value of \$6,569,693.16, gold.

During the last twelve months, there were sent 55,140,533 pounds of

coffee, at a declared value of only \$5,070,038.94, gold.

These figures speak for themselves. Notwithstanding the increased quantity forwarded, the returns in money have diminished by the round sum of \$2,914,920.49 in two years.

The depression in the value of coffee seems to be periodical, and therefore better times are hoped for in the future; yet, it can not be denied that it is very hard on the coffee planters and on the merchants who advance the money to the planters, and on commerce here generally. Coffee is the main staple of this consular district.

The production seems to be on the increase in all coffee-growing countries, but Maracaibo coffee is known for its superiority over other

coffees; it is very often sold as coming from Java.

#### HIDES AND SKINS.

The export of hides becomes larger from year to year. In 1894, the exports to the United States, according to the invoice value declared, were \$18,314.28, gold. The year 1896 showed an increase to \$52,184.84. During the calendar year 1897, the export was \$72,850.60, gold, while during the last year, ending December, 1898, 804,967 pounds of hides,

at a value of \$91,682.95, gold, were shipped.

In regard to the export of skins to the United States, a considerable improvement is also noted. During the last calendar year, exports from this port amounted to 174,924 pounds, at a declared value of \$26,069.92, gold, while in 1897, the value was \$14,986.86, and in 1896, \$12,499.29. As there are now at this place commercial houses which make a specialty of the purchase of skins, there will be, no doubt, a greater increase of exportation, and more care will be taken in the packing and selection of the skins for foreign markets.

#### BALSAM COPAIBA.

The export of this valuable article is also on the increase, yet it is not by any means what it could be, in view of the great unexplored forests of this consular district.

In 1896, exports to the United States were \$751.45, gold; in 1897, the export increased to \$8,209.50, gold, while this year shows an export of 35,956 pounds, at an invoice value of \$11,280.79.

# FISH SOUNDS.

While the calendar year of 1897 shows an export value of \$10,420.50, there was exported this last year about double—\$20,054.01, gold. This industry could also be enlarged greatly; most of the fishing is done by hooks and small nets; fishing, as it is understood among us, is yet unknown. I am of opinion that a fishery established on a large scale and with sufficient capital and trained hands, would do an immense business in the Gulf of Maracaibo and its lake.

Fish sounds are becoming more and more in demand, and all dried fish could find an easy market in the interior and the Cordillera States. At certain seasons, the lower part of the Lake of Maracaibo swarms with enormous shoals of fish of all kinds, but especially with the curbina fish, so much valued for its bladder, or fish sounds.

#### COCOA.

In 1896, exports to the States were valued at \$8,487.49; in 1897, the declared value was \$19,651.20; the calendar year of 1898 closes with an invoice value of \$46,614.79 for 227,380 pounds. Since the prices of coffee have come so low, the people pay more attention to other articles, especially to cocoa, an abundance of which grows in the Perijá district, but which has been neglected for want of cheap transportation. Perijá cocoa ranges first among all others, and will have a future as soon as the Perijá Railroad is constructed. The railroad would have been already in operation, as the capital could be found in the United States, but the syndicate here neglected the renewal of the concession before the minister of public works, and operations will have to be postponed until the new concession arrives from Caracas. Once this railroad is built into the heart of the Perijá district, Maracaibo will gain greatly, as this road will open one of the finest and richest sections of South America.

## QUINIA BARK.

Exports in 1897 to the United States were \$850.38; during the year 1898, they were only \$669.33. Every year the export becomes less, while it should be the opposite, as the forests teem with trees which give the quinia bark. I believe it is due to the lack of capital, that so many remunerative enterprises now lie dormant.

#### WOODS AND DIVIDIVI.

The export of these articles, which can be found in inexhaustible quantities, has nearly come to a stop. Only cedar wood, at a value of \$1,063.50; boxwood, \$3,019.39; ebony, \$212.30; alganobo wood, \$19.23; navanjillo wood, \$50 (the last two as samples), but no lignum vitæ or other valuable woods have been exported. The only reason for this I can find is the war with Spain, which for the time upset entirely our regular steamship connection with the United States, and interrupted all enterprises with sailing vessels.

#### HERON PLUMES.

Exports of plumes amounted to 15\frac{3}{4} pounds, at an invoice value of \\$2,141.25. As this industry is now under control of the federal Government, I think that the export will become less. The wanton killing of these birds and total destruction of the rooks made it obligatory for the Government to intervene, as otherwise the birds would have become extinct or been driven away from the lakes, rivers, and swamps, where they have done good work in destroying snakes, etc.

# RUBBER, WOOL, ASPHALTUM.

The export to the United States was only \$187.60. It could amount to thousands, if the people had the capital to develop this industry. The rubber tree is plentiful in this country and could readily be cultivated.

The value of the wool shipped to the United States amounted to \$2,553.63. As this country is known to be excellent for sheep raising, I have no doubt that more attention will be given to this industry in the future.

The asphaltum shipped to the United States, to the value of \$223.73, was only a sample. The entire State of Zulia is dotted with asphaltum lakes and springs in a hard condition, looking like cannel coal.

In my final remarks, I shall again refer to asphaltum and the other mineral wealth of this consular district.

# REMARKS.

The calendar year 1898 has been the worst that Venezuelan commerce has known. Civil war, quarantine against Venezuelan ports, the war between the United States and Spain, the low prices of the main staple of export, coffee, have brought on an absolute stagnation to commerce. This is much more felt here than it would be in other places where banks are established, and where there is a chance for a man with property to obtain money at a reasonable interest.

It speaks well for the healthy condition of the commerce of Maracaibo that, taking into consideration all these disadvantages, there was hardly any failure of consequence during the last year.

Notwithstanding the drawbacks, commercial relations with the United States seem to be increasing, especially in the dry-goods mar-Formerly, most of the prints came from England and Germany, but to-day, in the large stores, very handsome prints made in the United States are seen. A large importer of these articles a few days ago was kind enough to take me over his establishment, and I was astonished and pleased to hear that now most of his imported goods come from the United States. He admitted that if we continued to improve in our textile products, we would in future surely gain supremacy in the market.

Mr. Emil Herrenbruck, who is well informed as to the trade in dry goods and textiles in Europe, and is now establishing a commission house in this city, said to me:

There is no doubt that the importation of American dry goods has lately increased in a way that no one here would have believed possible, some years ago. In fact, in the last year, while all imports of English, French, and German dry goods have considerably diminished, on account of the bad state of affairs in Venezuela, the

demand for United States goods grew steadily.

Now that these goods have won a place in this market, it should be the aim of United States manufacturers to gain more ground. The principal American textiles introduced here are: Gray sheeting and drilling (liencillo y coton crudo 6 manta). Very little new can be said about this article; it is the one in demand, and rules the markets here. It has happened at times that merchants here have imported them in small quantities from England, but these have never been able to compete success-

fully with the American manufactures.

Gray ducks (lona y loneta) and tickings (coton 6 listados para hamacas) have also a good demand. The increase in importation of United States goods has been especially in prints. This kind of goods has lately found a very good market, and undoubtedly, the sale will be much larger; but it is necessary for manufacturers to pay more attention to the wishes of purchasers. The buyers often complain that the pieces of American prints are too long. The English manufacturers send pieces of 26 or 30 to 32 yards, while the United States cuts contain 50 to even 60 and more yards. The 26 to 30 yard ones are always preferable.

Printed drills, checks and plaids are goods that sell on a very large scale. Not

Printed drills, checks, and plaids are goods that sell on a very large scale. Not very long ago, a firm in Manchester sold a sort of printed drill imitating exactly the American labels, style of putting up the pieces, etc. Lately, the demand for a sort called "macana" has grown. This is very much used in the Cordillera in 40 to 45 yard lengths. Pieces of 60 and more yards are not salable.

In bleached shirtings (madapolán) the English marks rule the market, and until

now, they are unsurpassed in cheapness, quality, and finish. A firm here imported lately for trial a bale of American madapolan. The quality was very good, but the

merchandise had no sale, as it had not been finished according to the people's taste.

The demand for white shirting is relatively large, and I advise United States manufacturers to gain the market by finishing their goods in accordance with the wishes

of their customers.

Should the advice of an expert like Mr. Herrenbruck be followed, I have no doubt that it would materially help our trade in that class of merchandise.

During the last year, the letters from our merchants asking for information have greatly increased. From California came many inquiries as to possible openings for California wines, brandies, and raisins. Our people in the United States should bear in mind that all goods imported into Venezuela pay duties on gross weight, consequently, goods packed in thick boxes of heavy wood can not be sold as cheaply as those packed in light weight cases.

I will illustrate this on a small scale by my own experience last Christmas. It has been my custom to invite on this day children of my neighbors of the poorer class, and to give them sweet cakes, raisins, almonds, etc. As several boxes of raisins had to be bought for this occasion, my clerk asked what kind I wanted-European or American? I told him by all means American raisins. They were

bought, but I found that I had made a bad bargain on account of the heavy boxing. The wood of the boxes of the California raisins was about double in thickness and much heavier in weight. Consequently I had paid for the wood and was short of raisins, and I had to buy another box.

The quality is more or less the same, but the quantity in a box is much in favor of the European product. This example holds good for almost every box of merchandise sent from the United States, as no consideration is given to its heavy weight. There is no reason why California wines and brandies and fruits should not be introduced into the markets of Venezuela, but our friends at home must study the requirements of this country, in order to contend successfully with Europe.

Up to this time, only the commission houses in New York doing business with Venezuela understand the exigencies of the custom-houses; for South and Central American trade, the greatest care should be taken in packing goods. Merchants here have often given minute instructions to their friends in the United States from whom they

ordered goods, but seldom is their advice followed.

Goods sent here are packed as if they were intended for traffic within the United States. Goods of different classes should not be packed in the same box or bale. If, for instance, a half dozen silver spoons are packed in a box containing the cheapest cotton goods, the custom-house here would class that box as containing silverware, and add to it

a heavy fine.

These things often come under my observation. My interference is asked by our merchants, but is in most cases of no value, as months may have passed before the case is reported to me, and consequently the custom house authorities, with expressions of great regret, declare that they can not accommodate the consul, as the case is already out of their hands and the documents sent to Caracas. I have so often, in my annual and special reports, spoken upon this subject of packing and invoicing goods for Venezuela, that I can only hope that by sad experience, our people at home will learn to be more careful and attend to their foreign business as European merchants do.

I have received during the last year a great many letters from our best and largest brewing establishments in the United States, requesting information as to the introduction of beer in this market. United States beer can stand competition with European brands; but if our brewers intend to send their products to these countries, they must begin to study packing, etc. The heavy boxes, the big nails, the clumsy bottles,

and many other things might be done away with.

I have lately seen United States beer with a new kind of light stopper; all these improvements will help to reduce the weight. A light wire case of such dimensions that the wire may be used for other purposes might help greatly. These are questions for brewers to consider.

I would advise our export companies to study the customs and wants of the people of these Central and South American Republics with which they intend to do business on a large scale, to study the custom-house laws of these countries, and to be careful in the selection of their traveling agents. Men of good address, polite manners, and a knowledge of country and language, are needed for this work. They should remember that they have to compete with the trained agents of European houses.

I have known United States agents, instead of coming to a consular officer for advice, to appoint representatives here who are not looked

upon as responsible. Sales are made by some traveling agents in the most careless way, and the consequence is that later on, the export company writes to the consul to save what can be saved from a contract, where neither the buyer nor the seller seemed to have had a clear understanding.

In spite of all these drawbacks, which we will overcome as soon as our merchants and manufacturers give attention to the wants of this country, and especially to its tariff laws, we are gaining in the compe-

tition with European countries.

The development of Venezuela is noticeable. Maracaibo, as well as all the principal cities of the Republic, shows a great increase in solid houses; the pavement of its streets is better; sanitary conditions have been greatly improved; electric lights, telephones, and street cars have been established, and many other modern improvements introduced. The influence of prosperity is seen in cities and towns, but the country seems not to have made material progress as yet.

Venezuela is rich in everything, but needs development and foreign capital. The country needs means of communication between the cities and towns, be it by common wagon road or light railways or steam tramways. The cost of such roads would not be great, but they would be an important factor in the exploitation of the riches of the country.

The minister of agriculture, commerce, and industry of Venezuela has just issued a decree, fixing a time for the payment of taxes due on mining concessions granted by the Government. Defaulters will forfeit their concessions and the mines will revert to the country. Reforms in the mining laws are needed.

In this western part of Venezuela, mining is yet unknown, although minerals of all classes, coal, asphaltum, and petroleum, abound on the Lake of Maracaibo. Many mines have been taken up, but not one has

been worked.

Many mine holders do not know the exact location of the property they claim under the law. Others have not paid the small fee which the Government demands for the titles. Last year, a United States investor made an optional contract with some parties in Maracaibo for coal lands and asphalt mines. The owners did not know the exact location of the property, as they never had been there. It was found that the coal was not coal, but hard asphaltum, like cannel coal. The sale was not accomplished, as the owners of the titles wanted too much money. This year, another party in the United States wanted to transact business with the same parties, and I was authorized to attend to their interests. The holders of the titles asked several hundred thousand dollars. These mines are some distance from the lake, and it will be necessary to build a railroad. For a franchise for this railway, which was granted about ten years ago by the legislature of the State of Zulia, the sum of \$20,000 was asked.

The legislature here would be only too glad to grant concessions free

to dozens of mining enterprises, if they were asked for.

If the mining laws were changed so that persons who hold mines and do not exploit them inside of a certain time—say from one to two years—would lose their right to the property, it would be of great benefit to the country.

As the law stands to-day, it has a pernicious influence upon the development of mining in Venezuela, and it is to be hoped that by the next assembly of Congress in Caracas, steps will be taken to improve these conditions.

E. H. PLUMACHER, Consul.

#### SHIPPING AT MARACAIBO.

The war with Spain had a great influence upon the arrival of United States vessels at this port. No sailing vessel under our flag appeared, and for some time, our steamers were withdrawn on account of the presence of the fleet of Admiral Cervera in these waters.

The American Red D Line of steamers, Messrs. Boulton, Bliss & Dallett, was obliged to place steamers under German and British flags in order to carry on the regular business. For a time, we were without any communication with the United States, but all this was of short duration.

The loss of the steamer Maracaibo on the coast of Paraguana, on her regular trip to Maracaibo from Curaçao, has been a great drawback to regular communication, but I understand that the owners of the American Red D Line have already under construction a new steamer, with the best and most modern accommodations, for the passenger service between Maracaibo, Curaçao and other Venezuelan ports, making close connections with their regular steamers for the United States.

To replace those steamers of the Red D Line which were sold to the United States Government for naval service, new ships with greater speed and all modern improvements are already under construction.

In comparison with former years, very few sailing vessels under foreign flags arrived from Europe. This was due to the low coffee prices and the stagnation of commerce.

From the 15th of February, steamers belonging to the Hamburg-American Line will leave Hamburg monthly and call at the following ports: Havre, Barbadoes, Trinidad, Ciudad Bolivar, Campano, Cumaná, Guanta (Barcelona), and Maracaibo, and will probably, when loaded, return the same way. These steamers are cargo boats, but will also accommodate passengers, each having twenty cabins. The two ships especially devoted to this service are called the Borkum and Norderney, and have 1,233 tons, 500 horsepower, and a speed of 9 knots.

It is said that they carry 1,800 tons, and thanks to their nearly flat bottom and water-tank ballast of 374 tons, they will easily be able to

cross the bar of Maracaibo. With 9 feet draft, it is said, they can carry 600 tons cargo, and with 11 feet, about 1,000 tons.

I have no doubt that these steamers will find enough freight in Europe for Maracaibo, and it will be a death blow to sailing vessels from Europe to this port.

The return freights, however, will probably not be large, as the American line of Messrs. Boulton, Bliss & Dallett, New York, is more con-

venient for shippers of coffee to European markets.

Coasting trade has greatly improved, and river and lake traffic by steamers and sailing vessels is rapidly increasing. The new wharves and the landing piers for the steamers are opened to the public, and the new custom-house, with its large, commodious warehouses, is now occupied.

E. H. PLUMACHER, Consul.

MARACAIBO, January 20, 1899.

# PUERTO CABOLLO.

I have with much difficulty obtained from the records in the customhouses at this port the following information:

Imports from the United States, by months, for the year ending June 30, 1898.

July. August. September October November December January March April May June	93, 070. 39 110, 087. 20 67, 590. 53 97, 003. 34 96, 731. 60 71, 815. 30 90, 710. 00 92, 640. 00 (a)
Total	

These imports consisted of acid (carbolic), bran, brooms, books, butter, building materials, beer, canned goods, cotton goods, coal, carriages, candy, corks, earthenware, flour, furniture, fencing (woven and barbed wire), grain, hats, hops, hay, hardware, iron, ironware, jewelry, kerosene, lard, lumber, leather, medicines, machinery, musical instruments, oats, oakum, oils, perfumery, pasteboard, paper, pictures, plants, paint, rosin, rye, rope, scales, spices, stationery, tobacco, tools, timber (pitch pine), wicks, wines, whisky, etc.

This is a good showing when the facts are taken into consideration. There is not a United States house in Puerto Cabello or its vicinity, though there are European houses by the score, some of which carry stock to the value of a million dollars, and yet our merchants get more of the imports then are other and country.

of the imports than any other one country.

There are many European agents here and very few from the United States; yet I can not advise our merchants to send more to a territory

monopolized by branch houses of European firms. It is in this line

that we should meet our competitors' trade.

The imports from Germany from July 1, 1897, to June 30, 1898, were valued at \$385,179.75, gold. They consisted of agricultural implements, barley, butter, beer, drugs, dry goods, cement, crockery, cutlery, cheese, glassware, hardware, hams, iron and ironware, paint, paper, steel, sausage, twine, etc.

The value of these imports is small, if it is remembered that most of

the business houses in this vicinity are controlled by Germans.

England exported here during the period referred to to the value of \$350,584.50. She sent ale, beer, coal, dry goods, groceries, hardware, railway supplies of all kinds, etc. The railway supplies for two large companies, the English Bolivar Railway and the English Puerto Cabello and Valencia Railway, with groceries, dry goods, etc., for all their

English employees, are included.

France, for her share of the imports for the period, received \$144,897.64. She sent candy, cognac, dry goods, drugs, earthenware, millinery, wines, etc. The majority of the millinery proprietors and the most responsible retail liquor dealers in this vicinity are Frenchmen, and the wines and liquors of France, as well as its millinery, are in demand in all countries; therefore the share of France in the imports was not out of proportion.

Holland received \$78,165 of the imports for the period. Her mer-

chants sent excellent butter, cheese, hams, bacon, etc.

It is claimed by reliable business men that nowhere is butter so well prepared for the climate of these South American countries as in Holland.

Spain only received \$61,865.65 from the amount imported for the

period, sending here garlic, oils, onions, rice, wines, etc.

Italy, too, received little, her share of the imports for the period referred to being only \$31,044.05. She sent garlic, oils, onions, wines, and fine manufactured articles.

# EXPORTS.

In order to give a correct account of the exports of Puerto Cabello I was obliged to take up the invoices I found on file in this consulate, as the invoice book record was not correct. As this was necessary, I concluded to have this report show the name of the exporter; and I think the information will be of value to merchants in the United States.

LUTHER T. ELLSWORTH, Consul.

PUERTO CABELLO, March 2, 1899.

#### SUPPLEMENTARY REPORT.

I give below statement of the trade of this port for the six months ending December 31, 1898.

From the United States came goods to the value of \$485,995, this substantial increase demonstrating the fact that our manufacturers are the peers of the Europeans, when it comes to satisfying trade in any country.

A few weeks in Venezuela will satisfy the most skeptical that the European has every advantage that branch houses, years of acquaintance with the consumer, and ability to grant twelve or more months credit, is sure to give. Therefore, too much praise can not be given the manufacturers and traveling men who are daily increasing the trade of the United States with this part of Venezuela, under conditions and circumstances that would stagger a European.

The imports, by countries, were:

<u> </u>	
United States	. \$485, 995, 23
England	164, 050, 00
Germany	146, 690, 03
Snain	81 060 00
Holland	. 77, 296, 50
Italy	42, 460, 00
France	41, 808. 82

English, French, and German steamers call here about once in ten days.

The exports from Puerto Cabello to various countries from July 1 to December 31, 1898, were:

# THE UNITED STATES.

# ASIA.

# ADEN.

I have delayed as long as possible in sending my report, hoping that the annual report of the trade and navigation of Aden might be published, in order that my report might be accurate to a certainty. But as yet it has not appeared, and consequently in some instances figures are given which are practically correct, but have not been officially declared.

## TOTAL TRADE.

In considering the trade of Aden with the United States it must be borne in mind that Aden is not a commercial center; that its entire trade the past year only amounted to \$23,885,830.85. Of this amount, the exports were \$11,171,855.77 and the imports \$12,713,865.08. In view of this, the percentage of the United States does not appear so small.

Exports to the United States for the years ending June 30, 1897 and 1898.

Articles.	Value for 1897.	Value for 1898.
Coffee Drugs	3, 094. 33	\$551, 141. 10 3, 159. 0 50, 503. 7
Ivory Skins Shells (mother-of-pearl) Sundries	653, 487, 14	50, 503. 7 1, 188, 818. 9 9, 202. 8 1, 270. 5
Total		1, 754, 095. 8

There has been a considerable decrease in the quantity of coffee exported to the United States, but the decrease in value is much greater than that in bulk, the latter being about 10 per cent. There has been a marked falling off in the price in the past year. There are two reasons for this decrease in this export, the principal one probably being the war in Yemen the greater part of the spring and early summer, which prevented the running of the caravans from that district. The other reason is that, from all indications, the coffee of South America is gradually gaining the markets of the United States.

The most important export at present is that of skins. This has increased wonderfully, having almost doubled in one year. It will continue to increase, and there is no reason why the United States will not continue to be the market for almost the entire output. If the railroad to interior Abyssinia should be built and the facilities for transportation thus increased, the output would be very great indeed.

There has been exported from here to the United States \$50,503.78

worth of ivory, which comes from the African coast.

There has been a decrease in mother-of-pearl shells, the export for 1897 being \$17,054.50, while in 1898, it was only \$9,202.38. It is a little difficult to see why these shells are not marketed more extensively in the United States.

The other exports are ostrich feathers, gum arabic, and Somali curios. The two first mentioned have for several years been marketed in the United States in varying quantities, but for neither has a regular demand been established.

On the whole, the exports to the United States have increased, for the year just closed, \$295,143.50 over the previous year.

#### IMPORTS FROM THE UNITED STATES.

The imports from the United States amounted to \$799,122.24 in value during the past year, substantially the same as for the previous year. I regret very much that I can not give figures to show the exact amount in quantity and value of each item, but the figures are not obtainable

vet.

The principal import is cotton piece goods, and the United States has at least two thirds of this trade. The ordinary sheetings and drills are the kind demanded. These cottons are sent up and down the Arabian Red Sea coast as far as Jeddah and to the interior of Arabia. They also cross to the African coast into Somaliland, Abyssinia, and Erithrea, whence they are carried to the interior by camel caravans to Harrar and other places 300 and 400 miles from the coast.

The next most important import is that of petroleum, which is dis-

tributed to places in this vicinity.

There were also imported in small quantities liquors, manufactured tobacco, preserved fruits, canned meats, bicycles, and some shoes

#### CUSTOMS DUTIES.

No goods are subject to customs duties except manufactured tobacco, liquors of all kinds, and firearms and ammunition. The only general charge that is made is a small landing or wharfage fee, which is assessed on all goods landed in Aden, but this is only nominal and not regulated by the value of the merchandise.

#### CURRENCY.

The money used here as the circulating medium is the Indian rupee and fractional coins of the rupee, and the Maria Theresa dollar. The rupee's gold value at this date is 31\frac{3}{4} cents, and it has been practically steady for some months, when compared with its former fluctuation. The fluctuation in the last six months has been less than 2 cents per rupee. The dollar fluctuates more, and is not in such general use.

All quotations should be made to merchants and other inquirers in English pounds, shillings, and pence, as all are familiar with their exchange value, and it is on this quotation that goods, as a rule, are sold here. It is certainly a mistake to quote prices in American

dollars.

# BANKING.

The class of banking done here is almost exclusively of an exchange character. Exchange is not sold here on any point in the United States, but such business is done through London agents.

# TELEGRAPH LINES, MAILS, AND POSTAGE RATES.

Aden is in easy telegraphic touch with all parts of the civilized world. There is a station of the London and India cable here, and, in addition, subordinate lines to East and Northeast Africa.

Mails reach Aden by P. and O. steamer from India, Australia, and England each week. This is the mail line that comes regularly and most frequently. An occasional mail comes by French and German lines, the first monthly and the latter semimonthly, bringing mail from Europe and America.

Between here and India the rate of postage is the same as Indian inland postage on all classes of matter, and the Indian postage stamps are used. The foreign postage at present is the same as between all nations which belong to the Postal Union. The new penny postage, which is to go into effect in the near future between Great Britain and India, will extend to Aden and give this place the same rate to Great Britain, as is given India.

# MEANS OF TRANSPORTATION.

Transportation from Aden to neighboring ports of Arabia and Africa is by small steamers and native sailing vessels. From here to the interior of Arabia run numerous camel caravans, bringing out coffee, skins, etc., and carrying back supplies to meet the meager wants of the natives. The same system of transportation is in use from African ports to the interior. There is not a railroad in my consular district that is in operation (the one from Djibouti is not yet finished).

With the outside world intercourse is carried on solely by steamers. A great number of steamship lines call here, but, I am sorry to say, not

one of them flies the Stars and Stripes.

The time necessary for cargo to go from here to New York is from twenty-five to forty days. Recently, some cargo was landed in New York in twenty-four days after shipment from here, but this is exceptional.

There is no discrimination as to nationality of vessels at this port.

#### COMMERCIAL LICENSES.

There are no commercial licenses required, nor are special taxes exacted of foreigners who engage in business here.

#### GENERAL REMARKS.

In regard to new trade, the field, of course, is limited. The natives being half civilized, their wants are few. The European population is transient, consisting mainly of the military, who have a prescribed period for remaining at this fort, and their demands consist only of food and such necessaries as are ordinarily used by them at home. I have, however, wondered why more canned fruits, vegetables, and the like were not shipped from the United States. The preserved fruit imports are confined mainly to the manufacture of one English firm, while but few vegetables of any kind are brought here. Fresh American canned fruits and vegetables ought to find a ready market here. The demand will, of course, be small, but the European population will never grow any less, so it would be a permanent market when once secured.

I will be glad to give correct figures as to consumption of this kind of food, as soon as I can obtain the latest.

E. S. CUNNINGHAM, Consul

ADEN, October 5, 1898.

# BRITISH INDIA.

My last report of the trade and commerce of British India covered the year ending March 31, 1897. This report is for the year ending March 31, 1898. As there was nothing to interrupt business during the next quarter, ending June 30, except its partial suspension in Calcutta, owing to the presence, in a sporadic form, of the bubonic plague, which has now disappeared, it may be assumed that trade was relatively the same as in the preceding year, though there are no definite figures obtainable.

This report is based on the exchange value of the rupee at 31 cents,

the average for the year.

#### COMMERCE.

The imports and exports of the year are set out below, in comparison with those of the four preceding years.

## IMPORTS.

Article.	1893–94.	189 <del>4</del> _95.	1895-96.	1896–97.	1897-98.

		EXPORTS.	<u>,</u>		
Foreign merchandise reex-					

\$13, 739, 122 316, 248, 406 7, 766, 380 \$15, 677, 883 321, 648, 513 20, 864, 159 4, 495, 693 \$14, 624, 299 339, 591, 434 7, 760, 282 \$12, 504, 274 309, 680, 046 \$11, 628, **633** 290, 738, 913 Gold ..... 4, 713, 304 5, 359, 504 8, 349, 825 4, 760, 451 Silver ..... 342, 467, 212 362, 686, 248 367, 335, 419 337, 304, 600 814, 483, 469 The total value of the trade—imports and exports together—was higher by 0.38 per cent than in 1896-97, and only 3.28 per cent less than in 1895-96, which was a year of good trade. In this calculation, the transactions in treasure, which amounted to 14.2 per cent of the total trade, are included; but excluding them and dealing with merchandise only, the trade of last year shows a decrease of 5 per cent compared with 1896-97, and of 9 per cent compared with 1895-96. The decline in imports of merchandise is 3.5 per cent compared with the previous year. The serious decline in the trade of the year occurs in the exports of merchandise, the value of which was 6.1 per cent less than in 1896-97, and 14.6 per cent less than in 1895-96. The contraction in 1896-97 was clearly traceable to the failure of the crops in 1896 and the outbreak of the plague in western India, with the consequent disorganization of trade. These two calamities have also had a marked effect on last year's trade.

The extension throughout the country of quarantine regulations to prevent the spread of the disease, and the detention in camps of travelers coming from infected areas, restricted the movements of the trading population and placed serious difficulties in the way of purchasing and collecting produce. Besides, the famine was at its height during the first half of the year under review, and millions of people were in receipt of relief from the State until the harvesting of the autumn

crops.

The rains in 1897 were favorable, and excellent crops were harvested, but the season was late and the increased exports of agricultural produce, such, for example, as wheat, took place after the close of the

financial year.

A very noticeable feature in last year's export trade is the general fall in the value of all the important staples, except grain, the price of which was kept up by the scarcity of food. In some cases, this can be traced to special causes, such as overproduction, inferior quality of the produce, or the competition of foreign articles in the consuming markets; but the rise in the exchange value of the rupee must have tended to this result. In the trade with silver standard countries, the fall in the value of silver would further depress export prices, and this has occurred very markedly in the case of opium, the largest proportion

of which goes to China.

The trade in cotton goods declined by 11.3 per cent, and a proportionately greater decline is noticeable in the other textile fabrics of wool and silk, and in apparel. The trade in cotton and woolen goods had been overdone in 1896-97, and with the widespread distress throughout the first half of the year, and the impoverishment of great numbers of people by the famine, the decrease was to be expected. There were large importations of kerosene oil, and an improvement is noticeable in metals. In sugar, there was a remarkable increase of 51.8 per cent, owing to the extraordinarily large quantities of German and Austrian sugar poured into the country, the trade of these countries being diverted to the east by the countervailing duty on bounty-fed sugar imported into the United States, imposed by the Dingley tariff, and the successful competition of French sugar, owing to the increased export bounty allowance by the French Government.

The fluctuations of the import trade and the effect on the general result of the trade in cotton goods, are shown in the figures appended;

Articles.	1894-96.	1895-96.	1896–97.	1897-98.
Cotton goods	\$101, 288, 246	\$79, 848, 208	\$92, 225, 542	\$81, 824, 524
	116, 230, 811	135, 087, 621	180, 710, 021	188, 877, 847

The trade in cotton goods in 1896-97 increased by 15.5 per cent and declined last year by 11.3 per cent, while the trade in all other articles of merchandise decreased, in 1896-97, 3.2 per cent, and increased last

year by 2.04 per cent.

The general causes which restricted the export trade have been already mentioned. The largest falling off is in raw cotton, the exports of which to Europe decreased greatly under the competition of American cotton, which was exceptionally cheap and abundant. Opium and indigo show large decreases, both in quantity and price. decreased values of raw jute, lac, and tea are entirely due to a fall in price, the quantities exported being unprecedentedly large. The trade in cotton piece goods was depressed, the exports to China showing a great falling off, and the exports of sugar declined to a very low level. On the other hand, large increases of hides and skins, jute manufactures, and timber are recorded. The trade in these lines was active. and there was an improvement in seeds, wool, and oils, which in the case of seeds, is still more marked in the present year. There was but a slight increase in food grains, but during the first quarter of this year the trade in rice and wheat was very active, the export of the latter during that period amounting to 566,138 tons, valued at \$19,000,000.

The aggregate trade of the year, imports and exports together, is

stated below, with the trade of the five preceding years:

Excluding Government transactions:	4828 840 07A
1893-94 1894-95	509, 768, 329
1895–96	. 623, 629, 545 . 600, 873, 737
1896-97	. 600, 873, 737
1897-98	. 603, 160, 328
Including Government transactions:	
1893-94	. 638, 867, 371 . 620, 775, 155 . 635, 187, 792 . 614, 141, 319 . 616, 814, 765
1894–95	. 620, 775, 155
1895–96	. 635, 187, 792
1896-97	. 614, 141, 319
1897-98	. 616, 814, 765

The trade with countries having a gold standard, among which Japan now appears, was 76.4 per cent, and with silver-standard countries, 23.6 per cent of the whole trade. The trade in merchandise with the United Kingdom was valued at \$238,137,350, against \$257,407,570 in 1896-97, and it represented 46 per cent of the trade with the world in merchandise, the percentage of the previous year being 47.2.

The trade with the continent of Europe shows marked contraction, but with Austria-Hungary it increased, owing to the large imports of sugar from that country. The countries with which there was increased trade are the United States, South America, Ceylon, Japan, Persia,

Arabia, and Aden.

C R-VOL 1-61

The values of imported merchandise for the last five years stand thus:

1893-94	
1894-95	
1896-97	222, 935, 560
1897–98	215, 202, 372

The value of the trade last year was less by 3.5 per cent than in the preceding year, and about the same as in 1895-96. The increases and decreases in percentage of the most important articles in the import trade are shown below. The decreases are in cotton goods, machinery and millwork, woolen goods, coal, silk apparel, glassware, and liquors, and the increases in sugar, oils, metals, salt, railway materials, provisions, spices, drugs, and dyes.

	189	8–97.	1897	7 <b>-9</b> 8.	Actual in-
Articles.	Increase.	Decrease.	Increase.	Decrease.	or decrease (—) in lacs of rupees (100,000).
Apparel	Per cent.	Per cent.	Per cent.	Per cent. 19.1	28.98
Coal	l	80. 2		45.1	- 44. 17
Cotton goods	15. 5	8.8	8. <b>4</b> 8. 4	11.3	-835.52
Dyeing and tauning materials			5		+ 6.48
Ginss and glassware		5		18. 1	- 12.75
Liquors	· · · · · · · · · · · · · · · · · · ·	8		3.4	- 5.64
Machinery and millwork		15	9. 2	18.5	- 64. 91 + 64. 72
Oils			20. 5		
Provisions		13.8	18. 9		+ 16.82
Railway materials	75	3.8	8. 1 38. 2		+ 21.47
Salt		23.7	90. 2	18.9	+ 24.02 - 42.31
Spices		8.3	23. 1		+ 14.01
Sugar	1.4 17		51.8	3 <b>2</b> . 1	+163. 26 54. 41
Total					203. 54

The net decrease in the items shown above is \$6,308,500, while the decrease in the import trade is \$7,731,400, the difference being in the articles of smaller importance.

Cutton piece goods and yarn have been declining steadily since 1×93, and there was a heavy fall in prices last year, and during the first quarter of the present year, a further decline in the price of yarns.

## BEER AND SPIRITS.

The importation of malt liquors decreased in quantity but increased in value. The quantity of beer brewed in India is contrasted below with the imports:

Year.	Imported.	Locally brewed.
1893-94. 1894-95. 1895-96. 1896-97. 1897-98.	2, 787, 672 2, 514, 041 3, 048, 743 8, 022, 171	Gallons, 5, 532, 725 6, 121, 905 6, 238, 877 6, 313, 946 5, 428, 383

The mobilization of a large number of British troops on the northwest frontier reduced the demand for both imported and Indian beer. The reduction in the quantity of beer brewed locally was also partly due to the high price of barley. Last year's importations were to the extent of nearly 94 per cent from the United Kingdom, the imports from Germany, Belgium, and Austria-Hungary being only 6 per cent. There was an advance in the importation of spirits, as shown below:

	(Jallons.
1893-94	1. 067, 373
1894–95	. 093, 115
1895–96	186 696
1896-97	179 909
1897-98	205 525

The relative proportion of whisky and brandy, namely, half a million gallons of the former and rather more than half that quantity of the latter, were the same as in 1896-97 and the preceding year. Germany, Holland, and Belgium sent 52,284 gallons of brandy, and 20,438 gallons of whisky were received from Germany.

### PROVISIONS.

The principal provisions imported the past two years were as follows:

Articles.	1896–97.	1 <b>897–9</b> 8.	Articles.	1896–97.	1897–98.
Fish: Dry saltedpounds Dry unsalteddo Wet salteddo Bacon and hamsdo	2, 466, 474 14, 542, 597	17, 127, 480 2, 176, 960 17, 162, 815 983, 730	Cheese pounds Butter do wt. Other dried fruit do Ghi pounds		911, 231 209, 785 658, 206 119, 034 393, 986

The quantity and value of sugar imported in the last three years have been as follows:

Year.	Quantity.	Value.
1896-96. 1896-97. 1897-98.	Owt. 2, 730, 963 2, 861, 400 4, 608, 630	\$9, 631, 120 9, 770, 669 14, 831, 884

The increase in the importations of sugar is one of the most noticeable features of the import trade of the year. The quantity imported is 61 per cent greater than in 1896–97, and the value higher by \$5,061,215. The first place is still held by Mauritius, but whereas the importation of 1,666,845 hundredweight in 1896–97 was 58 per cent of the whole trade, last year its share was reduced to 38 per cent, with an import of 1,778,016 hundredweight. There is an increase from all the sources of supply, but the bounty-fed beet sugar from Austria-Hungary and Germany has flooded the market.

### HARDWARE AND CUTLERY.

The value of the imports of hardware and cutlery last year was much less than in 1896-97, and reached to the level of 1895-96.

1895-96	\$4,598,772
1896-97	4, 829, 000
1897-98	4, 581, 214

The proportion of these goods imported from the United Kingdom was 79 per cent. This head is divided into the following subheads:

Articles.	1896-97.	1897-98.
Outlery. Agricultural implements Other implements and tools Sewing machines. Other kinds of hardware.	\$145, 210 242, 354 145, 058 144, 546 4, 151, 830	\$306, 807 275, 397 405, 430 101, 280 3, 492, 298

Germany and Austria-Hungary sent last year nearly 19 per cent of the whole of the hardware and cutlery imported.

### IRON AND STEEL.

The imports of iron and steel for the last three years are as follows:

Year.	Iron.	Steel.
1895-96	Owt. 4,000,246 3,892,843 3,945,364	Owt. 1, 702, 253 1, 568, 181 1, 848, 704
1991-90	3, 855, 805	1,020,70%

There was a rise last year in both cases, and notably in steel, for which the figures are the highest ever shown. The use of steel for rolled beams, girders, bars, and hooping, which were formerly made of iron, is increasing.

The following list includes the descriptions of iron and steel which are commonly imported, and the extent of the trade in each for the last three years:

Description.	1895 <u>-9</u> 6.	1896-97.	1897-98.
Angle, bolt, and rod Bare Galvanized Sheets and plates (including tinned plates) Pipes and tubes Beams, pillars, girders, and bridge work. Pig. Nails, screws, rivets, and washers Hoop	598, 426 726, 430 561, 887 883, 771 244, 774 201, 057 211, 355	Cuot. 781, 613 538, 627 815, 294 486, 562 853, 828 158, 816 260, 968 179, 726 89, 923	Ouet. 738, 105 538, 603 764, 975 603, 445 393, 330 101, 407 217, 415 207, 577 84, 226
Bars Beams, pillars, girders, and bridge work	321, 511 223, 586	582, 745 287, 838 221, 743 15, 380	801, 937 267, 482 278, 651 225, 977 25, 248

The increase in the trade in iron was chiefly in the importations from the United Kingdom, and in steel from Belgium and the United Kingdom.

Last year's importations of angle, bolt, and rod iron and steel bars from Belgium greatly exceeded those from the United Kingdom, and there is a close competition between the two countries in bar iron, nails, screws, rivets, iron plates and sheets. The English trade has a monop-

oly of pipes and tubes and tinned plates, and a very long lead in galvanized iron and steel hooping. It must be remembered, however, that the figures relate to the countries of shipment, and these are not always the countries of production.

Copper, iron, and steel represent 96 per cent of the quantity of all imported metals, iron and steel being about 91 per cent of the whole.

## MACHINERY.

Imports of machinery and millwork have been as follows, the last three years:

1895–96	\$10, 035, 943
1896-97	
1897-98	

After large imports in the two preceding years, the trade declined heavily, the reduction being partly due to the delay in deliveries caused by the engineers' strike of 1897.

### BAILWAY MATERIAL.

Importations of railway material the last three years were as follows:

Year.	For companies.	For the state.
1895-96.	\$4, 718, 810	\$6, 260, 555
1896-97.	8, 251, 322	7, 143, 075
1897-96.	8, 916, 998	7, 671, 406

The extremely large imports during the last three years are the result of extensive construction of new lines by companies and by the state. A shipment of steel rails, valued at \$56,841, was received from the United States, owing to lower rates having been tendered than were obtainable in the United Kingdom, showing that the United States can successfully compete with other countries for the iron and steel trade of India.

## MINERAL OIL.

Importations of mineral oil the last five years have been as follows:

Year.	Gallons.	Value.
1893-94. 1894-96. 1895-96. 1896-97.	53, 441, 000 66, 648, 000 68, 421, 000	\$10, 154, 318 6, 581, 296 9, 198, 940 9, 578, 664 11, 320, 555

The relative imports of Russian and American oil are as follows:

	Russia.	United States.
Total in five years ending 1895–96	Gallons. 167, 600, 000 45, 500, 000 50, 700, 000	Gallons. 150, 500, 000 19, 300, 000 26, 000, 000

Langkat oil from Sumatra came into the market in 1896-97, when a little over 500,000 gallons were imported. Last year, the imports rose to 7,540,866 gallons, of which 670,032 gallons were received in bulk. The price of Sumatra oil in Calcutta is now the same as Russian oil,

and there is every prospect of the importations increasing.

The trade in bulk oil is increasing at a rapid rate. About 7,000,000 gallons were received in 1894-95, 10,000,000 gallons in 1895-96, about 14,000,000 in 1896-97, and last year, 22,000,000 gallons. The whole, except the small consignment above mentioned from Sumatra, came from Russia. The large stocks and the rise in exchange have lowered the price of both American and Russian oil. Mineral oil, mainly kerosene, represented last year \$11,320,555 out of \$12,854,354, which was the total of all kinds of oil imported.

### COTTON GOODS.

The principal clothing of 250,000,000 of the population of India is cotton, and the value of cotton goods imported in 1895-96 represented about 37 per cent, in 1896-97, 41 per cent, and in 1897-98, 38 per cent, of the value of all imported merchandise. The demand for piece goods is principally dependent upon the harvest. After the failure of the crops in 1896-97, the heavy imports of that year could find no outlet owing to the prevailing distress, and large stocks had to be carried forward, so that the flow of orders to Lancashire was checked; but with a good monsoon and plentiful harvests, prospects have now brightened.

The relative imports of the different descriptions of goods under the heads of gray, white, and colored, during the last two years, were as

follows:

Description.	1896–97.	1897-98.	Description.	1.896-97.	1897-98.
GRAY.	Yards.	Yards.		Yards.	Yards.
Jaconeta	96, 189, 000	100, 705, 000	Chadars, dhutis, saris,	l	
Mulls	20, 211, 000	21, 879, 000	and scarves	58, 172, 000	40, 344, 000
Prints			Drills and jeans	3, 782 000	3, 560, 000
Shirtings		643, 810, 000			
Madapollams			atripes	5, 830, 000	11, 738, 90
T. cloth and domestics	18, 058, 200	15, 063, 000	1		
Jeans, sheetings, and			COLORED.		
drills	<b>22, 594, 00</b> 0	25, 856, 000	_		
Chadars, dhutis, saris,			Jaconets	5, 187, 000	4, 968, 00
and scarves	455, 220, 000	305, 864, 000	Mulls	4, 872, 000	8, 417, 00
			Prints and chints	129, 702, 000	102, 530, 00
WHITE.			Shirtings	45, 080, 000	38, 882, 00
Jaconets	33, 057, 000	32, 625, 000	Drilla	5, 259, 000	4, 766. 00
Nainsooks		135, 007, 000	Cambrice, twills, and		
Mulls	84, 980, 000	106, 199, 000	muslins	74, 757, 000	61, 987, 00
Shirtings		71, 056, 000	Chadars, dhutis, saris,		
Long cloths	2, 278, 000	1, 885, 000	and scarves	29, 459, 000	22, 664, 00
Cambrics, twills, mus-		.,,	1		
line, and lawns	12, 044, 000	10, 762, 000			

It appears from the figures that goods made of medium counts, say from 30's to 40's, constituted last year about 96 per cent of the whole imports of gray goods, thus:

Description.	1896-97.	1897-98.
Shirtings, chadars, dhutis, saris, scarves	Per cent. 84. 7 12. 1	Per cent. 82.6 13.5

The small quantity not received from the United Kingdom comes mainly from the Continent and from the United States. The trade with the latter country is increasing, and the imports therefrom doubled last year.

Besides the three great classes of piece goods, gray, white, and colored, referred to above, the other principal kinds of cotton manufactures imported are:

Description.	1895-96.	1896–97.	1897-98.
Handkerchiefs and shawls in the piece.  Lace and patent net.  Hosiery.  Sewing thread.	146, 589 312, 690	\$494, 586 141, 400 607, 714 435, 484	\$271, 758 75, 971 597, 534 482, 880

In my previous reports, I have stated the immense demand there is here for cotton goods, and the opportunity for the manufacturers of the United States to get a good share of the trade by making proper efforts, and would now emphasize what I have already urged. The door is open, and our manufacturers have only to walk in and take possession of the market.

## BICYCLES.

There is a steady increase in the demand for bicycles, and the better qualities from the United States are generally preferred.

### IMPORTS IN GENERAL.

The list appended states, in the order of their importance, the principal articles of merchandise imported into India the last three years:

Article	1895–96.	1896–97.	18 <b>97-98.</b>
Cotton goods and yarn	\$79, 843, 203 25, 596, 532	\$92, 225, 542 21, 763, 596	\$81, 824, 524 23, 769, 938
		9, 770, 669	14, 831, 884
Sugar Oils, chiefly mineral	9,626,002	10,661,365	12, 854, 354
Railway material	4,713,810	8, 251, 322	8, 916, 998
Machinery and millwork	10, 135, 943	10, 881, 589	8, 867, 434
Chemicals, drugs, medicines, narcotics, and dyes		5, 859, 384	6, 387, 686
Silk, raw and manufactured		6, 950, 786	5, 638, 999
Provisions		4, 804, 429	5, 287, 785
Liquors	5, 257, 066	5, 099, 326	4, 924, 331
Apparel	4, 942, 268	4,700,902	3, 812, 549
Woolen goods		5, 246, 858	8, 560, 128
Salt		1, 948, 486 1, 874, 489	2, 493, 025 2, 308, 796
SpicesGrain and pulse	390, 472	1, 721, 913	1, 893, 458
Glass and glassware	2, 297, 341	2, 182, 976	1, 787, 680
Coal	4, 348, 649	3, 094, 968	1, 665, 791
Precious stones and pearls, unset	2, 022, 288	1, 638, 908	1, 396, 519
Matches	1, 120, 442	882, 898	1, 293, 304
Umbrellas	1,067,075	951, 523	1, 039, 659
Paper and pasteboard	1, 270, 957	1, 191, 268	1, 029, 343
Stationery	1,037,275	1,028.82	859. 902
Tea	1, 529, 797	1, 607, 102	660, 250

The total value of imports of foreign merchandise in the last three years was distributed among the principal countries with which the trade was carried on, as follows:

Country.	1895-	1895–96. 1896–97.		1895–96. 1896–97. 1897–98.		98.
United Kingdom Germany Stratte Settlements Belgium Austris-Hungary Russis China Mauritius United States Ceylon France	\$146, 100, 600 7, 290, 505 6, 433, 182 8, 461, 902 4, 107, 100 5, 789, 429 8, 698, 159 5, 336, 150 8, 532, 257 1, 679, 487 3, 034, 807	Per cent. 68 8.4 3 8.9 1.9 2.7 4.2 2.5 0.6 0.8	\$156, 294, 253 7, 154, 245 5, 710, 578 7, 451, 479 4, 612, 142 6, 259, 731 6, 662, 175 5, 602, 656 4, 547, 541 2, 161, 193 2, 852, 897	Per cent. 70.1 3.2 2.5 3.8 2.1 2.8 3 2.5 0.9 1.3	\$144, 485, 801 7, 547, 008 7, 470, 406 7, 083, 000 6, 655, 058 6, 450, 348 5, 242, 137 5, 217, 520 4, 436, 382 8, 220, 540 2, 736, 667	Per cent. 67.1 2.5 3.5 3.5 3.7 4.1 1.1

### EXPORTS.

The exports of Indian merchandise during the last five years were as follows:

1893-94	\$316, 248, 406
1894-95	321, 648, 513
1895-96	339, 591, 434
1896-97	309, 630, 046
1897-98	

In the following list, the principal articles exported and their values for the last three years are shown:

Article.	1895-96.	1896–97.	1897-98.
Grain and pulse Jute, raw Cotton, raw Seeds. Hides and skins Cotton yarn and cloth Tea Opium Jute manufactures Indigo Coffee Wool, raw Wood and timber Lac Oil, including paraffin wax Provisions Silk, raw Dyes, other than indigo Spices Saltpatter	\$56, 707, 599 30, 977, 899 43, 679, 598 30, 124, 086 23, 682, 381 25, 888, 219 23, 761, 152 26, 223, 941 14, 717, 073 16, 598, 984 6, 814, 395 4, 201, 534 2, 485, 890 5, 684, 163 2, 289, 991 2, 773, 861 1, 990, 733 2, 605, 317 1, 517, 477	\$41, 571, 672 32, 706, 782 40, 207, 275 24, 836, 208 21, 704, 247 26, 831, 069 25, 186, 069 24, 871, 106 16, 163, 183 18, 549, 346 4, 913, 620 8, 848, 640 2, 475, 926 9, 919, 572 1, 887, 345 2, 944, 103 1, 586, 149 1, 960, 701 1, 540, 673 1, 77, 706	\$43, 567, 015 31, 402, 975 27, 501, 070 26, 641, 710 25, 784, 355 25, 289, 147 24, 981, 73 18, 902, 445 18, 385, 653 9, 477, 946 4, 709, 303 4, 205, 264 4, 709, 303 4, 206, 285 1, 194, 345 1, 462, 046 1, 236, 109

The conditions prevailing last year were most disastrous to the export trade, which shows a decrease of more than 6 per cent, following a fall of nearly 9 per cent in the previous year. The decline is largest in Bombay, which suffered from a recrudescence of the plague in the latter half of the year. The failure of crops in 1896 had a most prejudicial effect on the export season of 1896–97, the latter part of which fell within the period under review, and the continuance of widespread distress until the harvesting of the autumn crops restricted the export of rice and other food grains.

The most marked depression is in the important staples of cotton, opium, and indigo, the decreased trade in these commodities and the heavy fall in prices being chiefly due to a falling off in the external demand. The fall in prices is marked in many other commodities, and the decline in the value of the exports of jute, shellac and tea is due solely to this cause.

The only remarkable increases are in hides and skins, jute manufactures and timber, while seeds and wool show some recovery from the

depression of the previous year.

WHEAT.

The exports of wheat during the last five years have been as follows:

Year.	Bengal.	Bombay.	Sind.	Burma and Madras.	Total ex- ports.	Total value.
1898-94	Owt. 1, 037, 998 240, 526 1, 011, 934 74, 107 75, 783	Owt. 4, 700, 180 1, 045, 785 2, 797, 842 1, 159, 698 377, 594	Owt. 6, 418, 317 5, 600, 989 6, 192, 816 676, 250 1, 988, 912	Owt. 56 543 320 498 368	Owt. 12, 156, 551 6, 887, 791 10, 002, 912 1, 910, 552 2, 392, 607	\$16, 101, 048 7, 952, 340 12, 138, 077 2, 592, 824 8, 157, 568

The collapse in the trade in the second half of the year 1896-97 continued through the first half of last year. The harvest of 1896-97 was below the average, and with the general prevalence of distress, prices

ruled at abnormally high figures.

From August, 1897, the price of wheat in London began to rise, and there was a rapid decline in Karachi prices from January, 1898. A brisk revival of the trade began in March. In the present year, with a crop estimated to be 33 per cent above last year's yield, and abnormally high prices in Europe, the trade has been very active, the exports during the first three months being 11,322,756 hundredweight, valued at \$18,771,454.

The high price of wheat naturally caused a decline in the exports of flour, which fell from 67,177,000 pounds in 1896-97 to 56,592,000 pounds in 1897-98, a decrease of 15.7 per cent. Flour is sent mainly to Mauri-

tius, Aden, Arabia, Ceylon, and Zanzibar.

### TEA.

The exports of tea exceeded those of 1896-97 by about 2,500,000 pounds, and the total quantity exported was nearly twice as large as the quantity exported twelve years ago. It is estimated that the production of tea in 1898 is about 6,000,000 pounds in excess of the production of 1897.

The exports were distributed as follows:

Country.	1895–96.	1896-97.	18 <b>97–98.</b>
United Kingdom Australia Persia Turkey in Asia. United States Russia Canada	3, 188, 000 1, 356, 000 581, 000 486, 000 408, 000	135, 457, 000 6, 156, 000 1, 994, 000 1, 981, 000 785, 000 458, 000 823, 000 327, 000	187, 656, 000 6, 793, 000 1, 464, 000 1, 337, 000 930, 000 689, 000 564, 000 466, 000

The shipments to the United Kingdom were nearly 91 per cent of the whole. The direct shipments to the United States increased, but there was a marked fall in the consignments to Canada. These countries are, however, largely supplied through the United Kingdom, the exports thence being:

То	1895.	1896.	1897.
United States	Pounds.	Pounds.	Pounds.
	908, 743	902, 619	612, 574
	828, 207	905, 597	1, 184, 389

Messrs. Gow, Wilson, and Stanton give the following additional figures for transhipments and exports to North America:

	1895.	1896.	1897.
Transshipments via United Kingdom	Pounds.	Pounds.	Pounds.
	2, 299, 781	3, 123, 224	3, 309, 114
	40, 000	327, 833	607, 167

The same firm states that the consumption of tea in the United Kingdom was: From India, 54 per cent; Ceylon, 37 per cent; China, 7 per cent; other countries, 2 per cent.

The places of shipment of India tea are:

From—	1895–96.	1896–97.	1897–98.
Bengal Bombay Sind Bombay Burms Burms	3, 940, 295 674, 795 2, 510, 059	Pounds. 143, 235, 822 2, 413, 247 505, 344 2, 690, 027 64, 021	Pounds, 145, 363, 650 1, 983, 315 845, 754 3, 242, 079 17, 019

There is a small export from Travancore and Cochin.

## METALS, ORES, CINCHONA.

The export trade in hardware and cutlery and metals is of little importance. The value of manganese ore from the Madras presidency constitutes nearly one-half of the trade. Last year, 68.8 per cent of the quantity exported went to the United Kingdom and the United States.

The quantity of cinchona bark exported was 3,056,769 pounds, or nearly ten times more than in 1896-97. The consignments were all from the Madras presidency to the United Kingdom.

### OPIUM.

The exports of opium for the last five years were:

1893-94	\$24, 860, 226
1894-95	28, 100, 461
1895–96	26, 223, 941
1896-97	24, 871, 061
1897-98	18, 902, 445

More than half of the shipments go to China. There is a considerable trade in the export of cigars, and there has been a gradual increase during the past five years.

INDIGO.

## The exports of indigo the last five years were as follows:

Year.	Weight.	Value.
1893-94 1894-95 1895-96 1896-97 1897-98	Cust. 131, 399 166, 308 187, 337 169, 523 133, 849	\$12, 964, 596 14, 712, 336 16, 598, 984 13, 549, 346 9, 477, 946

The season was generally unfavorable, the estimated yield of the crop of all India being 10.5 per cent below that of 1896, and 19 per cent below the average. It seems probable that the prices may be permanently lowered by the competition of the artificial dye, which may affect the future prosperity of the indigo-planting industry of this country.

### OILS.

The most important oils exported are castor and cocoanut, and the figures below give the quantities shipped the last five years.

Year.	Castor.	Cocoanut.
1893-94 1894-95 1895-96 1896-97 1897-98	Gallons. 2, 294, 644 2, 679, 236 2, 016, 461 1, 997, 475 1, 953, 500	Gallons. 821, 355 2, 285, 524 2, 205, 727 1, 137, 538 1, 046, 235

#### COTTON.

# The exports of cotton in the last five years were as follows:

Year.		Value.
1893-94 1894-95 1895-96 1896-97 1897-98	Owt. 4,789.000 3,385,000 5,248,000 5,216,000 3,723,000	\$41. 219, 677 26, 980, 403 43, 679, 5 :8 40, 207, 275 27, 501, 071

The acreage sown with cotton was about 1,000,000 acres less than the average, the decrease being due in part to the substitution of food grains for cotton, with a view to replenish exhausted food stocks, though the yield approximated the average. There was a serious decline in the exports during the financial year 1897–98, but this must be attributed to other causes than the shortness of the supply. The shrinkage is primarily due to the fall in the price of American cotton, caused by an unusually large crop, the price of our cotton being relatively, and during part of November absolutely, cheaper than Indian cotton. It may be noticed that the fall in the quotations of American cotton caused a large increase, last year, of the imports into Japan from the United States.

### HIDES AND SKINS.

The exports of hides and skins the last three years were as follows:

Year.	Hi	ies.	Ski	ins.
1895-96. 1896-97. 1897-98.	7, 427, 943	\$8, 092, 066 7, 877, 236 10, 462, 289	Number. 8, 173, 037 6, 310, 988 9, 842, 409	\$7, 877, 236 3, 155, 641 3, 470, 031

There was a brisk demand from the Continent of Europe and the United States for both hides and skins, and with the plentiful supply provided by a year of drought and famine, there was an increase of both as compared with 1896-97.

### JUTE.

The export of jute in the last five years was as follows:

Year.	Quantity.	Value.
1898-94	12 977 000	\$26, 424, 803 32, 785, 528 30, 977, 869 32, 706, 788 31, 402, 975

The area sown with jute in 1897 was about 2 per cent less than in the previous year, but the season was very favorable, and the very large crop harvested exceeded expectations. The quantity exported is the highest on record, being 31 per cent more than in 1896–97, but notwithstanding the large increase in amount, the fall in price reduced the value of the exports to 4 per cent below the level of 1896–97.

The destination of jute has been as follows in the last five years:

	1893–94.	1894-95,	18 <b>95–96.</b>	1896–97.	1897-98.
United Kingdom Germany United States France Austria-Hungary Italy Spain.	1, 171, 000 854, 000 335, 000 297, 000	Cwt. 6, 842, 000 2, 380, 000 2, 167, 000 558, 000 423, 000 363, 000 179, 000	Owt. 7, 384, 000 1, 755, 000 1, 577, 000 545, 000 373, 000 344, 000 196, 000	Owt. 6, 749, 000 1, 823, 000 1, 272, 000 572, 000 238, 000 334, 000 127, 000	Owt. 8, 125, 000 2, 708, 000 2, 174, 000 722, 000 536, 000 511, 000

It will be seen that a large percentage of the export goes to the United States, though not so much as formerly, before our mills were closed by the action of the Wilson tariff. Under the present Dingley tariff, our mills will probably be reopened, and a larger quantity of raw jute will be taken and less of the manufactures, thus giving employment to our people.

The value of cotton goods exported amounted to \$3,671,960, the proportion shipped from Bombay amounting to 52 per cent. Madras does a considerable trade in these goods, especially in dyed goods, the value

of the trade of the province being 44.5 per cent of the whole.

The progress of the spinning and weaving industry in the last six years is shown in the table below.

Year.	Mills.	Spindles.	Looms.
1892-98 1898-94 1894-95 1895-96 1896-97 1897-98	147 154	8, 378, 803 8, 539, 681 3, 711, 669 3, 844, 307 3, 975, 719 4, 175, 124	26, 317 29, 392 34, 161 37, 278 37, 303 36, 946

About 148,000 persons are stated to have been employed in the mills at the end of 1896-97, and the capital invested is returned at over \$44,000,000, but this statement of capital is imperfect, the figures being confined to mills worked by joint-stock companies. The Bombay presidency contains 70 per cent of the spinning and 78 per cent of the weaving capacity of Indian mills.

The value of the exports of manufactured jute in the last five years

was as follows:

1893-94	\$10, 669, 539
1894-95	
1895-96	14, 717, 073
1896-97	
1897-98	

The destination of the gunny bags the last two years was as follows:

Country.	1896–97.	1897–98.	Country.	1896–97.	1 <b>897-9</b> 8.
United Kingdom. United States Australia Straits Germany South America China Egypt.	22, 910, 000 21, 852, 000 20, 235, 000 8, 468, 000 15, 051, 000 9, 028, 000	89, 370, 000 39, 005, 000 30, 336, 000 16, 096, 000 12, \$39, 000 10, 123, 000 7, 282, 000	Cape Colony Belgium Asiatic Tarkey Mauritius Natal Sandwich Islands Other countries	8, 791, 000 4, 765, 000 2, 882, 000 2, 390, 000	4, 852, 000 4, 752, 000 8, 760, 000 2, 619, 000 2, 262, 000 2, 192, 000 10, 442, 000

The principal destination of the cloth in the last two years has been:

Country.	1896-97.	1897-98.	
United States	Yards. 111, 600, 000 26, 600, 000 23, 800, 000 3, 800, 000	Yards. 179, 100, 000 84, 000, 000 18, 700, 000 4, 800, 000	

More than two-thirds of the cloth and a large proportion of the bags went to the United States. As these jute mills pay large dividends under the operation of the Dingley tariff, these goods should be manufactured at home.

#### GENERAL EXPORTS.

The total value of the exports of Indian produce and manufactures in the last three years was thus distributed among the principal countries:

G	1895	96.	1896-	97.	1897-98.	
Country.	Value.	Per cent.	Value.	Per cent.	Value.	Per cent.
United Kingdom		31.9	\$95, 103, 542	31.7	\$90, 508, 223	31. 1
China	42, 712, 119	12.6	42, 413, 967	13.7	37, 456, 190	12.9
Germany	24, 968, 559	7.8	23, 360, 354	7.5	22, 262, 944	7.6
United States	18, 313, 420	5.4	14, 922, 488	4.8	18, 211, 598	6.3
France		7.9	19, 702, 037	6.4	17, 444, 816	6
Straits Settlements	18, 122, 886	5.3	15, 524, 793	5	13, 310, 158	4.6
Japan		2.5	12, 635, 246	4.1	12, 889, 741	4.4
Ceylon	10, 850, 254	3.2	9, 640, 947	3.1	12, 393, 145	4.8
Egypt	16, 044, 797	4.7	15, 046, 039	4.8	12, 236, 750	4.2
Belgium		3.6	9, 463, 952	8.1	9, 386, 669	8.2
Italy	9, 678, 350	2.8	9, 386, 685	8	8, 289, 914	2.8
Austria-Hungary	10, 367, 915	3.5	7, 739, 723	2.5	6, 513, 902	2.2
South America	3, 761, 440	1.8	4, 452, 040	1.4	5, 307, 345	1.8
Australia		1.1	3, 654, 515	1.2	8, 831, 184	1.8
Mauritius		i i	3, 490, 370	1.1	3, 485, 026	1.2

It will be seen that the United States is fourth in the list, the trade amounting in 1897-98 to \$18,211,598.

In the subjoined table are given figures of the trade (merchandise only) with the several divisions of the world, during the last five years:

Country.	1893-94.	1894–95.	1895-96.	1896–97.	1897-98.	
Europe. Africa and sdjacent islands Asia America. Australia	107, 970, 686 20, 845, 748	\$373, 581, 756 32, 932, 648 115, 885, 436 27, 565, 618 4, 880, 094	\$379, 384, 306 83, 905, 354 125, 062, 506 26, 291, 441 4, 501, 950	\$362, 611, 077 33, 501, 638 119, 242, 271 24, 622, 763 5, 091, 130	\$338, 595, 630 28, 680, 344 116, 919, 369 28, 50*, 018 4, 871, 557	

The trade with America amounted in 1897-98 to \$28,501,018, and while there has been a satisfactory increase of the trade with North and South America, the exports from the United States constituted a small proportion of the trade, the principal export being kerosene oil. There was a very decided falling off in the trade with the United Kingdom in 1897-98, amounting to \$21,115,682 as compared with the previous year, owing largely to the falling off in the imports of cotton goods, though the trade is gradually going to other countries.

## IMPORTS FROM UNITED KINGDOM.

Besides cotton goods, the other principal items in the list of imports from the United Kingdom during the last three years were:

Article.	1895-96.	1896-97.	1897 <b>–9</b> 8.
Apparel	\$2,756,668	\$2, 701, 216	<b>\$2, 424, 08</b>
Coal		2, 546, 8R8	1, 520, 100
Chemicals, drugs, medicines and narcotics, and dyes	. 2, 828, 254	2, 489, 293	2, 735, 173
Hardware and cutlery	. 3, 618, 676	3, 780, 118	3, 631, 395
Liquors	. 3, 818, 800	3, 639, 452	3, 511, 52
Machinery		10, 750, 099	8, 743, 71
Copper		1, 907, 978	2, 994, 739
fron and steel		7, 529, 218	8, 436, 16
Provisions and oilmen's stores	. 2, 224, 733	2, 094, 892	2, 121, 0g
Railway plant and rolling stock		8, 220, 040	8, 819, 544
Salt	1, 344, 544	1, 219, 735	1, 761, 24
Silk manufactures	1, 736, 058	989, 478	830, 571
Woolen manufactures	2, 912, 896	3, 529, 505	2, 574, 81

The balance of the imports of these articles is divided between the Continent of Europe and the United States—Belgium, Germany, Austria, Hungary, and the United States in their order, the latter being much the lowest in the list.

### GENERAL REMARKS.

In making this report, I am indebted to the honorable director-general of statistics of the Government of India for his "Report on the trade of India for the financial year of 1897-98," and have used such figures as should be of interest to the people of the United States, showing the magnitude of the trade and the possibilities of the markets of this country for their manufactures.

The facts and figures speak for themselves, and it only remains for our manufacturers to make a determined persistent effort, by sending and keeping intelligent energetic agents here, with samples of their

manufactures, to secure a good share of the trade.

While they may be looking to our new possessions, Hawaii, Cuba, Porto Rico, and the Philippines, and other countries of the far East, for the expansion of their trade and an outlet for their surplus products, there is no country in the world that, in my opinion, will better pay to

exploit than this.

The trade can not be established by correspondence with merchants, as the people of this country are conservative and must come into direct contact with those with whom they deal, in order to secure their confidence, and must see actual samples of the goods they buy; but when confidence and trade are once established, and the goods are found satisfactory, there will be no trouble in holding the business.

To save expense, I would suggest that manufacturers of different lines of goods send a first class active agent here with samples of their

goods, and have him solicit orders for all.

The line of steamships recently established between New York and Calcutta, the largest distributing point in India, will not only be a great economy of time in the delivery of the goods, but will save the cost of transshipment, which has heretofore been a great hindrance to business with the United States.

R. F. PATTERSON, Consul-General.

CALCUTTA, October 27, 1898.

## CEYLON.

## IMPORTS.

The imports of Ceylon for the calendar year 1897, as per customs records, amounted to \$28.580,000 (exclusive of specie). showing an increase in value over the previous year of \$2,880,000. Of this increase, \$1,560,000 is credited to the United Kingdom; \$124,100 to Australia; \$700,000 to British Possessions in India; \$380,000 to China; \$530,000 to French Possessions in India; \$180,000 to Germany; \$120,000 to Japan; \$35,000 to Switzerland; \$33,500 to United States; and \$129,400 to various other countries. Total increase, \$3,546,500.

The decrease was from Aden, \$32,600; Hongkong, \$55,000; Belgium, \$19,000; France, \$43,000; Maldive Islands, \$70,000; Russia, \$63,000; Siam, \$21,300; Straits Settlements, \$20,000; other countries, \$342,600.

Total decrease, \$666,500.

The increase was largely in arms and ammunition, cotton goods, curry stuffs, earthenware, fish, dried and salted; grain, haberdashery and millinery, malt liquors, hardware and cutlery, metals, wrought and unwrought; kerosene oil, spirits and cordials, sugar, tobacco, and woolen goods.

Some of the above-named goods are absent from the customs schedule. They came, however, from the United States indirectly, and the total value of imports from that country was about \$110,000.

#### EXPORTS.

The exports to all countries amounted to \$25,270,000, according to the customs schedule; and if this is the actual fact, the colony is in a bad way, for it is amazingly poor in money and can not afford to import more in value than it exports.

The principal commodities were coffee, cinnamon, cocoanut oil, dessiccated cocoanut, coir, einchona bark, plumbago, and tea. The greatest falling off in value was in cinchona bark, which dropped from \$22,950 in 1896 to \$10,840 in 1897. Coffee fell from \$573,711 to \$467,400. However, all the other great staples more than held their own, and tea, the new and main product of the island, increased from \$13,945,360 to \$15,643,730.

### EXPORTS TO THE UNITED STATES.

The exports to the United States were valued at \$1,076,845. They consisted of cinnamon, citronella oil, desiccated cocoanut, cocoanut oil, cacao, curios, coffee, coir fiber, croton beans, nuxvomica, plumbago, tea, and some elephants' hides. There were no new products, and the principal articles in value were: Cocoanut oil, \$407,239; plumbago, \$279,547; desiccated cocoanut, \$62,988; tea, \$143,043; citronella oil, \$104,043; cinnamon, \$35,613. The value of the other articles, respectively, was comparatively inconsiderable.

## FIRST HALF OF THE YEAR 1898.

The exports to the United States during the first half of the year 1898 were valued at \$810,768. The principal articles in value were plumbago, \$306,406; tea, \$159,183; cocoanut oil, \$114,906; citronella oil, \$87,628; desiccated cocoanut, \$82,201; cinnamon, \$37,573. It therefore appears that the exports to the United States this year are likely to exceed those of any other year since 1892, when they amounted to above two and a quarter million dollars, and the division of values is being considerably changed. For example, so far plumbago, as well as tea, exceeds cocoanut oil, which heretofore has been the leading article. Dessiccated cocoanut nearly equals citronella oil, and cinnamon, for six months, exceeds the shipments of the whole previous year.

## PRINCIPAL EXPORTS TO ALL COUNTRIES.

The total exports for the half year to June 30, 1898, amounted to \$13,838,123, and were made up as follows: Cacao, \$422,960; cardamoms, \$158,423; cinnamon, \$333,610; cinchona, \$11,300; citronella oil, \$348,983; cocoanut oil, \$935,155; desiccated cocoanut, \$356,494; coffee, \$163,314; coir, \$271,800; plumbago, \$974,000; tea, \$8,371,745; all other products, \$1,389,339.

## PRINCIPAL IMPORTS IN 1898.

The imports for the same period amounted to \$14,084,400, and came from: the United Kingdom, \$4,258,500; British colonies, \$8,538,700; Germany, \$320,000; French possessions in India, \$170,000; China, \$170,000; Russia, \$131,800; Maldive Islands, \$104,500; Japan, \$72,000; United States, \$58,500; Dutch possessions in India, \$60,000; France, \$56,300; Holland, \$28,000; Belgium, \$33,300; Austria, \$20,300; Switzerland, \$21,000; Sweden, \$18,500; Italy, \$8,000; all other countries, **\$14,000.** 

The chief imports from the United States were: Kerosene oil, \$53,000; lubricating oil, \$130; clocks, \$100; cotton cloth, \$3,500 (128,540 yards); medicines, \$200; condensed milk, \$220; tobacco, \$1,350.

### MISCELLANEOUS.

Other articles from the United States were: Beef, salted; bicycles, carriages, cheese, confectionery, wheat flour, fruit, dried; harness, lard, wine (kola), wine (in wood), 1,050 gallons; paint; sewing machines, millwork machines, shooks of casks, lamps, stationery, steam riding

gallery, and toilet soap.

During the period under review, there have been no important changes affecting the industries of this country, or new processes adopted opening up markets for American manufactures. The superior qualities of our goods do not, as a rule, constitute a factor toward creating a demand for them. The masses are too poor to pay for excellence in anything; accordingly, the cheap European wares with which the people are abundantly supplied answer their purposes and their means so well that, in my judgment, it is impossible to displace them with superior articles.

For instance, the value of cotton textiles imported is, excluding yarn and twist and hosiery, as follows: Gray cloth, unbleached, \$520,230; gray cloth, bleached, \$365,121; piece goods of mixed materials, \$1,086,000; piece goods, printed, \$146,300; piece goods, dyed, \$51,513; muslin and patent net, \$26,320; total, \$2,195,484.

These goods are made mostly of short staple cotton, and highly sized. They are imported ad libitum on long credit, at about one-third the rate of freight prevailing from America, say \$5 per ton, against \$15. All dealers have them, and all buyers are accustomed to and satisfied with They are sold at very low prices, and a vast majority of buyers would not, and probably could not, pay anything more for very superior articles.

If, therefore, American manufacturers seriously contemplate competing, they will need to employ experts, and even then may be unsuccess-The same conditions prevail in every other important branch of the import trade, which, by the way, is greatly overdone here. Profits are, as a rule, very small, owing to excessive competition, and losses are probably more numerous than gains. This is so well understood that the bank discount to traders is nominally 12 per cent, and sometimes 18 per cent, and sometimes not available at all, unless to exceptionally reliable customers.

Locally, there has been no change in the value of the currency. silver rupee is the monetary unit, and the paper money is at par with the silver. Fifteen days' drafts on the United States Government sell at about 3 rupees per dollar, and commercial exchange for demand on

London rules at about 1s. 33d. per rupee.

There were no material changes in port regulations during the year, except 10 days' quarantine, imposed upon vessels arriving from plague-infected districts in India; there was no other quarantine. No new lines of communication were opened up internally and no material changes in freight rates made. A through line of ocean steamers, called the "Indo American," was established, and is largely patronized. The local agents are Messrs. Aitken, Spence & Co.; agents in New York, Messrs. Norton & Co.

There are no licenses or passports required of commercial travelers, and no discriminating regulations against vessels of any nationality or affecting United States trade. There is no law requiring goods to be marked to show the country of manufacture or origin.

I can not learn of any local demand for a change from the classes of cotton goods that have heretofore obtained in this market, except with respect to "Horrocks Long cloth," which is being displaced by a sort of calico.

W. MOREY, Consul.

Colombo, September 29, 1898.

### DECLARED EXPORTS—CEYLON.

Value of exports declared for the United States for the year ended June 30, 1898, at the several consular offices in Coylon.

Article.					
	Sept. 30.	Dec. 31.	Mar. 31.	June 30.	Total.

## CHINA.

## REPORT FROM CONSULATE-GENERAL AT SHANGHAI.

Exports from Shanghai to the United States were greater in 1897 than in any previous year. Every item of export increased, excepting feathers, furs, and rugs. Of the increase of \$4,650,000, silk and tea are to be credited with much the largest part. This advance was in spite of the increased strictness of examination, on account of which 2,400,000 pounds of pingsuey was left on hand in this market, not being up to the required standard. Every kind of silk appreciated in price and amount shipped.

The first six months of 1898 show a slight increase over the corresponding period of 1897, in exports to the United States. Silk holds its

own; tea exports increase slightly, and the great increase in shipments of goatskins more than balances a loss on other articles of export.

It is remarkable that there should be any increase during this period. During the first half of 1898, communication between the two countries was disturbed and irregular. The United States took, one after another, almost all the ships sailing regularly from American ports to this coast, and the trade between China and our Pacific coast was practically at a standstill. Political conditions in China were also much disturbed. So far as could be seen, everything was against trade between the two countries, and the fact that it increased in spite of all, shows the solid basis of mutual demand on which it is founded.

The result of the greater strictness of inspection of tea is noteworthy. The growers of pingsuey tea apparently made up their minds that the new standard would not be enforced, and prepared their tea for the season of 1897 no better than in 1896. Other qualities of tea were prepared by the standards sent out. These latter have never had a more profitable year; at the end of the season, about 2,400,000 pounds of unsalable pingsuey was in stock here. The Chinese authorities took the matter in hand and issued proclamations calling attention to our inspection rules and urging all Chinese to so prepare their tea that it would pass inspection. In accordance with this advice, I believe these common grades of tea are much better prepared this season than last.

The great staples of export from the United States to China—kerosene and cotton goods—were in greater demand in 1897 than in 1896. Into Shanghai there were brought 36,909,060 gallons in 1897 as against 25,750,090 gallons in 1896, a gain of 11,158,970. But Russian and Sumatran oils gained 13,386,270 gallons in 1897, over 1896, in this port.

In cotton goods, a like substantial increase is shown. Of drills and sheetings (American), 3,950,618 pieces were imported into China in 1897 as against 3,478,359 pieces in 1896. The commissioner of customs at Shanghai accounts for the fact that our trade in cotton goods increased at the expense of England's trade, by stating that freight was much lower from the United States than from England.

It is estimated that the total imports from America to this port were valued at about \$8,000,000 gold during 1897. Probably, not much money was made by the firms handling this business here, as the rapid and great fluctuations in the price of silver forbade any certain calculations. Many goods are imported here from Hongkong, and hence credited to England.

Of the 2,178 merchant vessels entering this port in 1897, 50 carried

the American flag.

During the first six months of 1898, American kerosene to the amount of 22,080,100 gallons came into Shanghai, being an increase of 7,525,100 gallons over the corresponding period of 1897. From Russia 753,660 gallons less oil was imported during the first six months of 1898 than of 1897, while Sumatran oil leaped from 2,570,175 gallons during the first half of 1897 to 8,152,603 gallons during the same period of 1898.

Of American drills, 596,216 pieces were imported, being an increase of 21,325 pieces over the same period of 1897; and the imports of American jeans increased from 30,000 pieces to 42,002 pieces. Sheetings, however, were in less demand; 1,003,930 pieces were imported from January 1 to June 30, 1898, as compared to 1,347,108 pieces in the same time in 1897.

The import of English sheetings declined from 353,251 pieces in the first half of 1897 to 298,631 pieces in 1898.

I would again call attention to the three points in which we must change, if we are to increase our trade with China as we should. Oil

and cotton goods are our staples for this trade. These two constitute the great percentage of our entire exports to China. The many other articles, in the manufacture of which we excel, are practically unknown

in this country.

We do not advertise enough here. I do not mean by this, newspaper advertising or advertising by circular. These only appeal to the few thousand foreigners sojourning here, but do not reach the hundreds of millions of Chinese. They will learn to appreciate our goods only by seeing them. I do not know to-day where in Shanghai I could buy an American hat, or shoes, or underwear, or collars, or furniture, or a telephone of improved quality, or a magazine. I might make this list much longer. What goods we send here are usually put in the hands of people of other nationalities, who do not exploit them. I hope to see an exposition of American goods here in Shanghai, managed by Americans. It would pay to put one also in Canton, and one in Chefoo or Tientsin.

In the next place, we do not cater to the trade here. Our steel mills have not supplied the rails for the railways in northern China because the pattern is English, and to make them would necessitate new rolls. The cotton men are now just beginning to inquire if the widths, etc., they have been accustomed to make in America are what is really wanted in China. Only one American life insurance company has reached out for this trade with any vigor. If this trade is to be taken and kept by America, its needs, customs, and superstitions must be

studied on the ground by experts in each department.

In the third place, our merchants must be willing to settle disputes in regard to damages in shipment and disagreements as to quality and breaches of contract here as is done by English and Germans. The average dealer here will pay a higher price for an article, if he knows that a cheap and speedy method of settling any possible dispute can be had

be had.

Methods of packing, means of transportation, exchange, banking, etc., must be studied by experts, each for his own line of business. But all must show their goods to the Chinese; study the wants of the people; and favor the trade by facilitating settlements of disputes.

Early in 1898, the inland waters of China were thrown open to navigation by foreign owned boats, but the rules adopted have so hampered the movements of such vessels, and the unsettled condition of the country has resulted in so many collisions between boat owners and likin collectors, that little extra trade as yet has come from this

long-desired concession.

The ease with which the viceroy at Canton was induced to protect, in his provinces, an American firm in the ownership of certain trademarks, and the certainty with which the Chinese courts in this city protect foreigners in trade-marks and copyrights, lead me to believe that a treaty protecting our people in their patents, trade-marks, and copyrights may be obtained. The proverbial imitativeness of the Chinese makes such a treaty highly desirable, all the more as our trade grows larger and more varied.

I send herewith a description of the varieties of cotton goods, their

count, weight, etc., shipped to this port from England.

John Goodnow, Consul-General.

SHANGHAI, December 2, 1898.

### [Letter from the American Trading Company.]

SHANGHAI, October 14, 1898.

Hon. John Goodnow, Consul-General, Shanghai.

DEAR SIR: With reference to your request that we will give you what information we can about the coarser classes of cotton textiles manufactured or consumed in different parts of the world, together with certain particulars about them, we now

different parts of the world, together with certain particulars about them, we now have pleasure in handing you the following information:

Of English goods, the chief article imported is gray shirtings, 38 inches, 38½ yards, and these come in several different weights, say, 7 pounds, count 13 by 11 and 13 by 12; 8½ pounds, 16 by 15 and 15 by 14 and 16 by 16; 10 pounds, 17 by 17 and 19 by 19 and 18 by 16; 11 pounds, 19 by 17 and 19 by 17 and 19 by 19; 13 pounds, 19 by 17 and 19 by 18 and 19 by 19.

Of the above, there are more 8½ pounds imported than the other weights. The counts are given to the one-fourth inch, English goods always being so described. Of course other counts are also used, but we have mentioned the most common ones.

Of course, other counts are also used, but we have mentioned the most common ones. There are considerable quantities of gray sheetings also imported, these always

being 36 inches, 40 yards. They come in 12 and 14 pounds, the former ranging from

16 by 14 to 16 by 17, while the latter are almost invariably 12 by 12.

These 14 pounds, of course, are made from heavier and more loosely spun yarn than the 12 pounds. It seems to be rather a recommendation to any goods if the yarns are not too smooth, as then, the cargo more closely assimilates the native Chinese cloth.

In addition to these goods there are, of course, considerable quantities of fancy

piece goods imported, and we will only mention one or two of them.

Calico prints, the designs of which are always specially printed for China, come in fair quantities, but it is hard to give any definite information about them, as the cloths vary so widely. As a rule, however, they come in 28 inches, 24 yards, and the lower classes are generally printed on cloths, say from 14 by 14 to 16 by 16.

Gray T-cloths are also shipped here, but this is not a very large trade. As a rule

they run in the region of 16 by 16, about 7 pounds per piece.

Your friends ask for the number of yards that go to the pound, but English goods are never sold on this basis. Where goods are sold by weight there are always so

many pounds per piece.

With regard to gray shirtings, which we mentioned above, we may say that the present tendency of the Chinese is to buy the better grade of goods, although they have to pay more money for them.

FRANK P. BALL, Agent, American Trading Company.

### COTTON GOODS TRADE IN SHANGHAI.

In a letter dated January 28, 1899, addressed to a United States firm, Consul General Goodnow gives the following additional information:

The piece goods trade from America to Shanghai is worthy of the attention of a skilled expert on the spot. No other American product occupies so important a place in the trade with China as do piece goods. The trade is almost exclusively for unbleached sheetings, drills, and jeans. The great increase is shown by the figures of the last three years.

Article.	China.	China.	Shanghai.
American drills pieces  Jeans do Sheetings do	1896.	1897.	1898.
	1, 226, 759	1, 531, 647	1, 517, 395
	52, 480	68, 076	100, 000
	2, 251, 600	2, 418, 971	3, 014, 772

The figures for 1896 and 1897 are taken from the customs report, the figures for 1898 from trade reports which are unofficial, but approximately correct. Sheetings are 36 inches wide and 40 yards long, and are put up in bales consisting of 20 pieces. The construction and weight varies from 2.85 yards per pound, counting 48 by 52; 3 yards per pound, 48 by 48; 3.25 per pound, 44 by 44. Drills are 30 inches wide by 40 yards long, and are put up in bales consisting of fifteen pieces, chiefly of 2.85 per pound, although some are sold here 3 yards to the pound, and the demand for the latter is on the increase. Jeans are 30 inches wide and 30 yards long, and are put up in bales consisting of twenty pieces. The demand has sprung up lately for goods 36 inches wide and 40 yards long.

The demand for cotton flannels is steadily increasing. It is estimated that during the year 1898 more than 150,000 pieces were imported. These are packed in stout wooden cases containing twenty pieces, each 30 inches wide and 30 yards long, weighing 2.85 yards to the pound. The trade in white shirtings is almost entirely with England. It is

estimated that imports in 1898 amounted to 1,764.309 pieces.

There is no textile directory giving the names of cotton spinners throughout all China. The foreign managers of cotton-spinning factories are, Fearon, Daniel & Co.; James Jones; Jardine, Mathieson & Co.; Arnold-Karberg & Co., and Ilbert & Co., of Shanghai. In addition to these there are in Shanghai three mills managed by Chinese. One at Soochow, one at Woochang, one at Hangchow, and one at Ningpo. The above foreign managers of cotton-spinning mills have in the past bought some American cotton. If the mills owned by the Chinese have bought any American cotton it has been through these foreign managers. There is no evidence of any probable demand for raw cotton from America. The yarn spun here consists almost entirely of 10s, 12s, 14s, 16s, for which the local cotton, although of short staple, is well suited, and only at exceptional times can cotton, with freight added to the first cost, compete with the product of the locality.

## AMOY.

Trade conditions at Amoy in 1897 were scarcely normal, owing to the prevalence of the plague during the greater part of the summer. In addition might be mentioned the rapid decline in silver, and a corresponding increase in the silver price of all imported goods, which caused a great falling off in imports.

The net value of trade for the year was \$19,460,424, which is \$57,641

below the figures of 1896, and \$739,914 below the totals of 1895.

The emigration to the Straits Settlements declined 25 per cent by reason of the quarantine imposed against this port, which accounted for a large decrease in the volume of business. However, the emigration to Manila increased in spite of the same conditions. The principal labor of Manila is done by Chinese, and it is said that almost the entire Chinese population of the Philippines comes from this province.

The rice crop of 1897 was above the average; native merchants prospered and the general tendency was for increased trade in all lines, which was prevented only by the above-mentioned abnormal conditions. Money was easy and prevailing rates low. Only when foreign quotations were being considered, did the dealer hesitate. The uncertainty of exchange was so evident that few invested in fabrics, hence a decline

in the imports.

American flour still controls the market, although it suffered from the above causes and fell from 14,232,400 pounds in 1896, to 6,961,466 pounds in 1897. The price in silver dollars was a little more than double the gold price. Thus it appears that while our mills sold only one-half the flour they did the previous year, the Amoy consumers paid almost as much for that commodity as in previous years, when exchange rates were not so much against the importer.

Importations of cotton fabrics increase annually, in spite of any or all drawbacks. The total value of cotton goods reaches the handsome sum of \$2,292,472, a marked advance over the previous record. American kerosene, while it still leads all other brands, has lost its prestige largely, and is being supplanted by the cheaper grades of Russian and

Sumatra oils.

It is impossible fo trace American goods arriving in China through the free port of Hongkong, as most of them do. They are forwarded from there without designation of origin. So far as I have been able to trace the goods, the trade between Amoy and the United States for 1897 stood as follows: Imports from the United States, \$181,350; exports, \$4,907,883. The export figures are complete, while the imports, for the reason stated, only represent a portion of the business done.

A. BURLINGAME JOHNSON, Consul.

### CHEFOO.

The following extracts are from the report for 1897 of the commissioner of customs in charge of the foreign custom-house. also a native custom house, which deals exclusively with Chinese. foreign customs is so called because, while belonging to the Government of China, its administration is in the hands of foreigners. It is the only institution belonging to the Government of China whose published returns can be depended on, and it is to this institution that we look for information relating to our trade, although it is conceded that an immense internal trade is done through the native customhouses, of which we know little or nothing:

Local.—When compared with 1896, the total net value of the trade of the port shows an increase of 2,518,023 haikwan taels (\$1,863,337, gold), and the revenue an increase of 34,415 haikwan taels (\$25,467, gold). The increase in value is due principally to increased imports of foreign goods from native ports, plus a larger export of native produce to native ports, and the enhanced silver cost of native products consequent on the dearness of copper cash. The increase of the revenue is due, in imports, to the large amount of ginseng received in the early part of the year from Korea, and in exports to an increased trade in pative products. in exports to an increased trade in native products.

In the direct foreign import trade, articles of European manufacture show a decrease, while those of Japan show a marked increase, notably Japanese yarn, which has advanced by 38,520 piculs (5,136,000 pounds, and matches, by 118,000 gross.

Imports of foreign goods from native ports have considerably increased; but as

they arrive here covered by exemption certificate, the revenue collected is no index of the trade.

Chefoo trade is, year by year, being handled more by the native than the foreign local merchant. In fact, if it were not for the very lucrative business in coal, the foreign mercantile community would be much smaller than it now is. Excluding tonnage dues, less than 5 per cent of the total yearly revenue is received from the foreign Chefoo merchants

The produce of the province is gradually finding its way to larger centers of trade than Chefoo—i. e., Shanghai and Tientsin. The local trade in pongees is almost

extinct, the finer grades being sent direct to Shanghai.

With regard to the business done by the native merchant during the past year, the market for old and new iron has been good, trade with Vladivostok has been remunerative, and better profits have been made in vermicelli. On the other hand, the Shanghai import trade (in foreign and native goods) has been bad; money has been lost on silk; the bean-cake business, although favorable in spring, was a failure in autumn and winter, and considerable loss was suffered on cotton yarn.

Mexican dollars were at one time as high as 7.55 mace each (\$0.55 gold), and copper

Revenue.—The total revenue for the year was 461,279 haikwan taels (\$341,356.46 gold), an increase of 34,415 haikwan taels (\$25,467.10 gold) over that of 1896. Out of the first-named sum only 40,845 haikwan taels (inclusive of 19,386 haikwan taels tonnage dues) were collected from foreigners.

Foreign trade.—(a) Imports: Here the net value was 3,685,050 haikwan taels, or 565,224 haikwan taels above that of 1896. There was a larger decrease in all descriptions of cotton piece goods.<sup>3</sup> Indian yarn fell from 44,428 piculs (5,923,733 pounds) in 1896 to 21,042 piculs (2,805,600 pounds), while, on the other hand, Japanese yarn advanced from 4,045 (539,933 pounds) to 42,565 piculs (5,675,333 pounds). Metals compare unfavorably with the figures of the previous year, there being decreases undar all headings 4. under all headings.4

In sundries, we note a large increase in Korean ginseng, 209 piculs (27,866 pounds), against 104 piculs (13,866 pounds), and Korean ginseng beard and cuttings 105 piculs (14,000 pounds), against 10 piculs (1,333 pounds). No kerosene oil was imported from abroad in 1897, our supplies having been drawn from Shanghai. Matches,

<sup>3</sup> Of the 31 classes of cotton goods, according to his table, 14 show a gain over the imports of 1896. All American goods increased.

<sup>4</sup> Native steel increased 50,000 pounds over 1896.

<sup>&</sup>lt;sup>6</sup>This is remarkable, as a landing certificate signed by me states that the British bark *Collingrove*, from New York, commenced to discharge oil December 28, 1897.

 $<sup>^{1}1</sup>$  picul =  $133\frac{1}{2}$  pounds.

<sup>&</sup>lt;sup>2</sup> Coasting vessels generally pay tonnage tax at Shanghai; as they are required to pay tonnage once in four months, this amount was mostly collected from vessels from Russian, Korean, or Japanese ports.

other than Japanese, declined from 177,150 to 100,625 gross. This large decrease is, however, more than compensated by an importation of 718,914 gross of Japanese matches, a gain of 118,014 gross over the previous year. Brown sugar shows an advance of 37,000 piculs (4,933,333 pounds).

(b) Exports: The value of the products of the port shipped to foreign countries

in 1896

has risen to 1,347,753 halkwan taels (\$997,337 gold), an increase of 195,033 haikwan taels (\$144,244.20 gold). Of the total value, Hongkong is credited with 45 per cent and Russian Manchuria with 35 per cent, while Japan, Korea, and Formosa, in the order named, make up the balance.

The principal goods shipped were beancake, beans, red and black dates, ground nuts, shoes and boots, and vermicelli.

Coast trade.—This heading shows \* \* \* a gain of more than 20 per cent over the value of the 1896 trade. Comparing 1897 with 1896, we find increases in the export of beans, ground nuts, ground-nut oil, yellow silk, wild raw silk, refuse silk, straw braid, and decreases in bean cake, silk pongees, and vermicelli. The production of the Chefoo Filanda has been in good demand. The bulk was well under contract to foreign buyers, who are again inquiring for this silk.

The native filatures were well occupied up to the last few months of the year. Their productions are chiefly sent to Shanghai, under contract to the foreign buyers there. Prices rose from 30 to 40 per cent over those of the previous year, owing to the lower rate of exchange and the greater demand from Europe.

Toward the close of the year prices declined, but the article was still fairly in request. In the autumn there was a good market for wild waste silk, but it died away again. The demand depends greatly on the requirements of the plush business.

The crop of cocoons was very poor, and owing to the competition caused by increase in the number of Chinese buyers, the price went up considerably. This, together with the rise in exchange at the latter part of the year, is causing earlier

buyers to lose a good deal.

 $\dot{\mathbf{A}}$  fair foreign export trade in yellow silk has been done. The result, though, can hardly be satisfactory, as purchases were made at the top of the market, since when the price here has fallen considerably, making later shipments to Europe much cheaper than those which went forward earlier. From a local point of view, the trade in silk pongees has been very bad. Prices went up in some instances as much as 75 per cent over the previous year's figures, and even then no good stuff was to be had, although buyers in Europe were able to pay advanced prices on account of the low rate of exchange. The manufacturers assign as reasons for the dearness of pongees the very expensive silk they had to use and the increased cost of labor, owing to the scarcity of the wage-paying medium, copper cash. Japan, India, and other Asiatic countries are now consumers, and apparently, quality is not of such importance in these as it is in European markets. Chinese dealers are getting full prices for their inferior goods, and it may therefore be to their advantage to weave pongees as they are doing at present, without sheen, full of streaks, and of uncertain length. The United States markets are now practically closed on account of the prohibitive import duty levied—as much as 700 per cent in some instances.<sup>2</sup> A pongee superior to that now presented to the Chefoo merchant can be obtained in Shanghai.

The export of straw braid amounted to 32,253 bales in 1896 and 34,209 bales in 1897. Foreign purchasers are responsible for this slight improvement, as Chinese merchants shipped a few hundred bales less than in the previous year. Improved plaits, from which much was expected, must for the present be considered a failure, the want of uniform good quality and the high price charged being largely accountable for unrealized hopes. The same remarks apply to "split fancies," but a large business was done in "split plain braid," for good qualities of which the demand is

likely to continue.

The rise in the value of copper cash requires to be taken into account, as from this cause alone, goods bought at 32 taels a bale in the early spring could not be

obtained in the autumn under 37 taels.

Reshipments constraine.—The value rose in 1897 to 633,493 haikwan taels (\$468,784.82 gold), an increase of 268,726 haikwan taels (\$198,857.84 gold) over 1896, more than one-half of which comes under Korean ginseng beard and cuttings, which were reexported coastwise to the amount of 354,016 haikwan taels (\$261,971.84 gold), as against 190,168 haikwan taels (\$140,724.32 gold) in the previous year.

Coastwise arrivals.—The value of the trade in foreign goods from native ports (chiefly Shanghai), and in native goods from native ports (chiefly Shanghai, Swatow,

I certified to invoices covering this silk exported to the United States to the value

of \$50,934.90 gold during calendar year 1897.

<sup>2</sup> Value of silk certified at this consulate for export to United States, July 1, 1896, to July 1, 1897, \$30,514.34. From July 1, 1897, to July 1, 1898, \$48,475.20; increased exports after the act, \$17,966.86 gold.

Tientsin, and Canton), amounted to 11,454,814 haikwan taels (\$8,466,562.36 gold), showing an increase of 869,070 haikwan taels (\$643,111.80 gold).

The whole of this increase is due to enlarged importations of foreign goods, native imports having, on the contrary, declined. In cotton goods, the most noticeable increases come under shirtings of all kinds (17,661 pieces), American drills (36,704 pieces), and Japanese yarn (28,328 piculs, or 3,777,066 pounds), while decreases are shown in English and Indian drills and sheetings, handkerchiefs, and towels.

The shrinkage in the importation of Indian yarn (50,979 piculs, or 6,797,200 pounds) is especially not everythy. Metals show diminution under pearly all headings. Every

is especially noteworthy. Metals show diminution under nearly all headings. Five million two hundred and eighty-one thousand and sixty gallons of American kerosene oil were imported during the year, against 2,388,250 gallons in 1896, showing a gain of 2,892,810 gallons, while arrivals of Russian kerosene (577,800 gallons) more than doubled the record of the previous year.

Native imports show a decrease in Shanghai and Hankow ginned cotton (4,255 pieces and 5,630 pieces, respectively), in raw cotton (4,872 piculs, or 649,600 pounds), in first and second quality paper (8,262 piculs, or 401,600 pounds), and in sugar of all descriptions (32,000 piculs, or 4,266,666 pounds.)

Inland transit.—Goods conveyed by water to and from nontreaty ports, both by

junks and by the Chinese steamer Kwangchi, pay dues at the native custom-house.

No dues are collected on merchandise transported by land routes.

Shipping.—The tonnage of vessels entered and cleared was 2,385,301 tons. The number of vessels increased by 53, and their tonnage by 119,486 over the figures for 1896. Sailing tonnage is gradually becoming more insignificant, being represented by only 31 vessels of 14,654 tons, against 39 vessels of 23,437 tons, in the previous twelve months.

British figures are slightly in advance of those of 1896, being nearly 56 per cent of the total tonnage. The Chinese and German flags, with 25 per cent and 9 per

cent, respectively, exhibit a small gain.
Freights have been well maintained during the year by the three coast lines, while

outside steamers have occasionally done well

Passenger traffic.—Fifty-seven thousand eight hundred and twenty-one natives left the port and 58,698 arrived here during the twelvementh, principally Chefoo coolies, going to and returning from Tientsin, Newchwang, and Vladivostock. The traffic to and from the last-named port has grown.

In 1891, the numbers were 492 and 1,685 to and from, respectively; in 1897, they were 8,679 and 12,684. Native passengers leaving Chefoo for Vladivostock are required to take out passports, for which they are charged 14 gold roubles (say \$2.40) each at the Russian consulate, and 1,800 cash (say \$2.10) by the Taotai, in all, \$4.50 per head.

Treasure.—As is always the case in this port, the exportations of treasure considerably exceeded the importations, a fact readily explained by looking at our trade-

value table, where the imports largely outweigh the exports.

A considerable quantity of gold obtained from the Liaotung peninsula is bought

up by native speculators and shipped to Shanghai.

The importation of copper cash—57,891 haikwan taels, mostly from Hongkong—did not do much toward improving the state of the local market, which suffered the whole year from the dearness and scarcity of China's only coin.

During the preceding four years, the highest quotation was that in 1894, 1,040 cash to the Mexican dollar; the lowest 860, in 1896. In 1897, the limits of variation were 900 and 730 cash to the dollar. \* \* \* \*

Miscellaneous.—The public bund and jettles, commenced in August, 1896, were

completed on December 5, 1897. The bund fronts the property of foreign owners and is 2,174 feet in length. The total area reclaimed, including streets, bund, jetties, and building lots, is about 42 mori. The bund is provided with seven sets of landing steps, two jetties, and a cargo slip and boat slip, the two last having been built at the special request of foreign merchants. The average width of the bund is 50 feet. The depth of water at the ends of the two jetties is over four feet in winter and six feet in summer at lowest spring tides. Thus, the loading and discharge of the street bearing streets and the district the streets. charging of cargo boats is greatly facilitated and the dispatch of steamers consequently hastened.

The inland steamer Kwangchi carried on her usual trade with the local non-treaty Among other goods, she took away about 6,000 bales of cotton piece goods 13,500 bales of cotton yarn, and 865 cases of kerosene oil, and brought to Chefoo 339 chests of native opium, 11,177 bales of straw braid, 4,187 bales of refuse silk, and 783

packages of cocoons.

Seven acres.

<sup>&</sup>lt;sup>1</sup> To-day, October 12, the rate is 800 cash to the Mexican.

### SHIPPING.

Number and tonnage of vessels entered and cleared, under each flag, for the year ended December 31, 1897.

Not a single American steamer appears in the list, and there are but three entries of American sailing vessels—really only two, as one, the *Quickstep*, entered twice during the year. The other was the *Comet*, since unfortunately wrecked off the Formosan coast.

Nothing disgusts me more than the study of the shipping tables of China. Our once preponderating influence is gone, and no one thing has done more to curtail our prestige, influence, and trade than this almost total disappearance of the American flag from the China seas.

How our shipping has declined can be seen from this table:

American ressels entered at port of Chefoo.

Year.	Steam- ers.	Sailing ships.	Total.	Year.	Steam- ers.	Sailing ships.	Total.
1866	10	18	28	1879	33	12	4

877	1 74	10	14	1897		3	
878	12	20	33	1000		_	

No American vessels entered during the years omitted.

The records of this office show that beginning in 1866 with 10 steamers, the number grew to 200 in 1876—high-water mark—while the largest number of sailers was 28, in 1868.

No American steamers entered in the years 1880, 1881, 1882, and 1883, or from 1886 to date. The entries for 1884 (93) 1885 (109) are accounted for by the transfer of the Chinese steamers to the house of Russell &

Co., and was only temporary, during the Franco-China war. No American sailing vessels entered in 1880, 1883, 1889, 1890, 1891, 1892, 1893, and 1896.

For years American tonnage led, and the flag was as frequently seen as now is the Chinese, which succeeded it with the fall of the great house of Russell & Co. American shipping then suffered a check from which it has not yet recovered.

I have been consul in China at a seaport for nearly ten years, and yet it was not until last June, that I had the great pleasure of seeing a full-rigged ship flying the Stars and Stripes sail into the harbor direct from the United States; it was a grand sight, and yet I could not repress a sigh as I thought of the time when these arrivals were of

everyday occurrence.

In the shipping list before me of the port of Shanghai, dated October 12, are noted three sailing ships from New York, one British and two American. The British ship, with oil, is consigned to the American Standard Oil Company; the two American ships are consigned to German firms. There are also several first class American houses in Shanghai that stand on their merits, but when the Pacific Mail Steamship Company dissolved partnership with the Japanese Nippon Yusen Kaisha, and it became necessary to run its steamers to Shanghai, it did not place its interests in the hands of one of the American firms; the managers appointed a British firm as their agents, and we see the only line flying the Stars and Stripes consigned to a British house, and this same company is also agent for a British line. I have repeatedly written on this phase of our trade during past years, and I am more convinced than ever of the folly our people perpetrate, in placing their interests in the hands of foreigners. I have seen evidence as to how American trade has suffered.

We know that we are a great and powerful nation, but do others know it, especially the nations of the East? The old saw, "seeing is believing," is especially applicable in China. What evidence have the Chinese that America is one of the great nations of the earth? In this harbor are daily seen British, German, Russian, French, Chinese, Norwegian, Dutch, and Japanese steamers, but our flag is missing. I tell the Chinese of our vast inland and coasting traffic, of the thousands of miles of railroads, of our overhead and subway roads, of the rapidity with which one can travel from New York to San Francisco. I show them maps of the United States, of the vast extent of territory from the Atlantic to the Pacific. I show them photographs of our inventions, of our beautiful cities; they smile, bow, thank me, and then blandly ask, "Where are your ships?" accentuating the question by looking at the harbor full of ships of all nations but mine.

We must build the Nicaragua Canal, lay cables to China via Sandwich Islands, and above all, restore our shipping. We should impose a discriminating tax on foreign ships entering American harbors, and

give rebates on cargo brought in native bottoms.

The following clippings from United States newspapers contain interesting facts:

## MONOPOLY OF MARINE INSURANCE.

Almost the entire business of marine underwriting is now done through agencies of foreign companies. Though the commerce of the country has enormously increased, being nearly quadrupled in forty years, yet the capital of these foreign companies invested in this country is only about \$7,000,000, this being the aggregate amount of the deposits required to be made with the insurance department under the State

The capitalization of the parent companies is unknown, no statement of such capital being published, and therefore, these foreign organizations pay only small taxes here for the privilege of doing business in this country.

It will be seen at a glance that competition by American companies, did these companies exist in sufficient number to attempt to compete, would be almost impossible, and until conditions shall materially change, there will be little incentive for Ameri-

can capital to engage in marine underwriting.

The spectacle is presented to-day of our ocean carrying trade being almost wholly in the hands of foreigners, who are receiving fully \$300,000,000 annually for the transportation of our imports and exports. Foreigners are also underwriting almost every ton of the goods carried, besides taking risks upon every ship engaged in the They contribute scarcely anything in the form of taxes for the privilege of conducting their business, and they vigorously resist every attempt which is made to require them to bear some portion of the expense of maintaining facilities for their shipping.

The remedy for this disgraceful condition of affairs seems to be the imposition of discriminating duties against goods carried in foreign ships. If this remedy should prove effective, it would tend to stimulate the growth of our American marine, and in that event, insurance would most assuredly follow the carrier, successful competition with foreign underwriters would soon become possible, and it could be made entirely successful by a system of taxation which would adequately protect American capital employed in underwriting. First of all, however, an American merchant

marine. After that, innumerable blessings and advantages will follow.

### NOT ENOUGH AMERICAN VESSELS TO CARRY AMERICAN FREIGHTS.

"What will you say," said President James J. Hill, of the Great Northern Railroad, in a recent interview, "when I tell you that the Great Northern road alone has been compelled to refuse the shipment of 60,000 tons of steel rails and 30,000,000 pounds of cotton—all demanded by Asia—simply because there are no water facilities by means of which this merchandise may be transported to Asiatic ports? Thus the city of Seattle has lost the benefits to be derived from the shipment of that enormous quantity of product, simply because the United States has no merchant marine, and what there is obtainable in other countries is largely under the control of a foreign element antagonistic to American business and favorable to foreign business

"My judgment is that the fearful sums of money which the Government of the United States has been compelled to pay for ordinary transport steamships suitable to be used in times of war, will compel Congress to take such action as will induce American capital to once more find investment in the merchant marine that may be sailed under the Stars and Stripes. If it does not, then stagnation must settle down again over American products simply because famine won't last forever, and the United States is at the mercy of foreign transportation companies operating the business of the world upon water. The American people must demand of their Congress such laws as will enable the United States to compete with other nations,

and not be compelled to rely on foreign shipping.

"Pacific commerce," continued President Hill, "is fraught with all that is propitious for the future. The next quarter of a century will witness an expansion and development of which the history of the world does not show a parallel. International maritime commerce is built up, guided, and made what it is by governments. Individuals can not do much; the government places the restrictions or affords the necessary encouragement for expansion and broadening. Our war with Spain, the dismemberment, the breaking up, of the Chinese Empire, the march of progress exhibited in Japan, are some of the factors now apparent that will for the future influence commerce with the Pacific coast of the United States."

#### AMERICAN CARGOES ON FOREIGN SHIPS.

The Ledger, of Tacoma, Wash., recently noted the loading at that port of eight steamers with steel rails for Japan. The rails were the product of an Illinois steel company, and are ordered for the remodeling of Japanese railways, which are to be equipped with American rolling stock. Steamers carrying the rails are described as the largest and most modernly equipped steel tramp steamships, each bearing from 4,000 to 6,400 tons dead weight. Commenting on the above, the New York Commercial remarks:

"These steamers are all British built, British owned, and British manned. what will the Japanese think of us, we a nation whose methods and styles she likes to imitate, to find American-built rails coming to them in British tramps? should not Japan think that British ships are best, if we show that we do by employing them almost exclusively in our ports to do our carrying? That may explain why Japanese shipowners go to Great Britain for their merchant ships and the larger part of their war ships. If American-built ships, owned and manned by Americans, were engaged in doing our carrying, they would show those nations that buy ships what we could do, and they might—probably would—come here to have their vessels built instead of going to Great Britain."

Only forty years ago, the Japanese did not own—in fact rarely saw—a steamer; now they have the finest lines on the coast. The Nippon Yusen Kaisha is the second most powerful line in the world, and two or three lines are running to the United States.

### TRANSPORTATION.

This has not materially improved, with the exception that last winter, a steamer left here on the arrival of the foreign mails from Shanghai for Shanhaikuan, where they were put on board the cars and forwarded to Tientsin and Peking. This was a vast improvement over the overland courier route, and offered an opportunity for a comparatively quick and comfortable trip to those whose business called them to Peking. No freight was carried by this steamer, which was chartered by the inspector of customs. No doubt, this method will be followed in the future, as it is impossible to think of relapsing into the old method.

Many of the steamers now stop en route, British at Weihaiwei, German at Tsingtau, and a steamer now plies twice a week to Port Arthur. Besides these, a new line is to start in the spring from Vladivostock, calling at Port Arthur, Talienwan, Chefoo, Shanghai, and Hongkong. This line is under the control of an American firm at the first-named port. The port as a shipping center is rapidly growing in

importance.

During the fiscal year ending June 30, 1898, the following different men-of-war entered this port: American, 5; British, 47; German, 11; French, 8; Russian, 30; Japanese, 30.

At one time this spring, there were 34 ships of war at anchor.

Chefoo as a shipping port is only exceeded by Shanghai. Its importance will be seen by the following table of arrivals and departures of steamers at the various ports during the calendar year 1897:

Ports.	Ships.	Tonnage.
Newchwang Tientsin Chefoo Shanghai Ningpo Fuchau Amoy	2, 591 5, 790 1, 248 681	790, 964 1, 826, 663 2, 385, 301 7, 633, 793 967, 533 641, 795 1, 727, 251

All communications with the United States are via Shanghai or Japan. Few ships trade direct. Only two (one American, one British) sailers entered this port for the twelve months ended June 30, direct from New York, both oil laden.

There is no shipbuilding in Chefoo. Nearly all junks or other large native crafts are built at Fuchau or Ningpo or other southern ports. The Taku docks at Tientsin now hold a torpedo-boat destroyer—the first time a foreign-government boat was ever docked north of Shanghai. As soon as the Whiting—the vessel in dock—comes out, it is proposed

to send the other destroyers there from Weihaiwei. This dock was able last spring to rebuild a coasting steamer, and this fact caused the

British admiral to try the dock for his destroyers, vessels of 216 feet.

The result of this experiment is looked for anxiously.

In June, the inland waters were thrown open to navigation, but owing to the vexatious and needless regulations, little if any advantage has been realized as yet. Already the officials are opposing and, in some instances, depriving owners from enjoying privileges that they had before the edict was published. Under proper and simple rules, this right to trade inland would be of incalculable value. I beg to refer to my report on this subject published in the Consular Reports, No. 214, for July, 1898, page 374.

At my instance, the Rev. Earle D. Sims has taken soundings of the river on which the capital of this province, Chinan-fu, is situated. His

report follows:

I arrived here yesterday, just five and a half days from Chefoo. I was two days on the Kwangchi to Yangchi kou, and then three and one-half days on a small boat

on the canal to Chinan-fu.

As you asked me what kind of a body of water the canal was, and as the captain of the Kwangchi also asked me the same, I took a number of observations on my return trip. I prepared a short sounding line on the American foot scale and took from 50 to 100 soundings each day. It is recorded that by the canal from Yangchi kou to Chefoo is 160 miles (480 li). I found that within 7 miles of Chinan-fu the water was over 8 feet, but never less than 8 feet. The last 7 miles the shallowest water was 3 feet 10 inches. Just here, the water is about 7½ feet. You can say that now, on account of this being the rainy season, it is about 1½ feet deeper than it is in the dry season; not more. I get this information from Chinese. The Chinese boatmen informed me that the water at the shallowest point in the dry season is never less than 2 Chinese Chinan-fu feet, about 2½ American feet.

Last winter being warm, it was not obstructed by ice, except for one or two days; but ordinarily, navigation is obstructed about one month each year on account of

freezing.

The canal is about 80 feet wide till nearing Chinan-fu, where it is about 50 feet wide. It has a good, hard dirt bottom, except for the last 7 miles, which seem to have a soft dirt bottom, and at one place, about 2 miles from Chinan-fu, there are a few pointed rocks, which keep the boatmen on the lookout in passing. The canal has good banks.

The Kwangchi referred to is a steamer belonging to Chinese, plying between Chefoo and the mouth of this river or canal. It is mentioned also by the commissioner in his report, copied above, as not entering or paying duties at the foreign customs, but at the native. In my opinion, the same privilege of trading on the coast should be granted to all steamers, whether foreign or native owned.

## QUARANTINE.

Quarantine rules are few, and are always drawn up at a meeting of the consular body when serious sickness prevails in the south; the consuls send the draft of the rules to the superintendent of customs—Taotai—with a request that he put them in force. As they change so often, and are so rarely enforced, it is not worth while to embody them in this report.

## COMMERCE OF CHEFOO.

	ited States gold.
1896	8. 602, 547. 36
Increase	427. 406. 09

Value of native produce imported from other Chinese ports.	
1896	\$2, 926, 370. 43 2, 600, 952. 00
Decrease	325, 418. 43
Value of native produce of local origin exported to foreign countries and	Chinese ports.
1896	\$5, 107, 033. 80 5, 710, 885. 62
Increase	603, 851. 82
Gross value of the trade of the port.	
1896	\$16, 208, 545. 50 16, 914, 384, 98

It is interesting, in comparing this table with the report of our representative in Korea, published in the Review of the World's Commerce, 1896-97, page 190, to note that the imports into all Korea in 1896 were valued at \$3,265,100, gold, while for Chefoo alone in the same year

the value of foreign imports was \$8,175,141, gold.

The values given above are those entered at the foreign custom house; of those entered at the native customs we have no record, but there should be added, as forming a part of the trade of this consular district, the value of goods brought overland from Shanghai (25,006 haikwan taels, or \$18,504.04, gold); Chinkiang, value not given (see This trade table transit trade); Tientsin, no record, but very large. can safely be estimated at 100,000 haikwan taels, or \$739,700, gold, bringing the total value of the foreign trade of this district to \$9,352,246, gold—almost three times the entire value of the foreign trade of all Korea. To this might also be added (were data available) the trade now passing in via the German port of Tsingtau, the British port of Weihaiwei, and the Russian port of Port Arthur.

In computing trade figures in China, the standard is and should be the haikwan or customs tael, for when the figures are reduced to a gold basis it is sometimes difficult to judge the trend of trade. In 1896, the average value of the haikwan tael was \$0.81; in 1897, \$0.7397, gold. It will be seen by studying the figures above for the gross value of the trade, that while it shows a gain by Chinese standard of 2,846,727 haikwan taels, the gold value shows a gain of only \$705,839.48. This discrepancy is accounted for by the fact that the tael was nearly 7 gold cents cheaper in 1897 than in 1896. Reducing the silver value, 2,846,727 haikwan taels, by \$0.7397, gives \$2,104,723.96, gold, the actual gold value

of the gain in gross trade in 1897 over 1896.

Dry statistical tables are not, as a rule, considered interesting reading, but one must feel a tittle pride to see the increase in imports of all American goods. To show that the gain is not an abnormal one, I append the following table:

Imports of merchandise especially termed American for the years 1893-1897 and the six months ending June 30, 1898.

Year.	Drills.	Jeans.	Sheet- ings.	Flour.		Gins	Ginseng.	
1893	Pieces. 37, 679 45, 025 59, 515 106, 326 142, 955 56, 037	Pieces. 900 1, 220 2, 250 2, 500 4, 260 2, 720	Pieces. 85, 055 108, 647 154, 540 217, 560 836, 741 230, 180	Hk. taels. a 9, 476 9, 638 25, 941 9, 502 9, 767 60, 429	\$9, 570. 76 8, 186. 62 20, 130. 22 7, 706. 12 7, 197. 58 41, 893. 87	Hk. taels. (b) (b) (b) (b) (b) (b)	\$84. 94	Gallons. 2, 253, 870 1, 883, 790 1, 967, 900 2, 388, 250 5, 281, 060 1, 475, 775

a For June quarter; no other record for that year.

b Not mentioned.

This table not only proves that imports of American merchandise are increasing on a sound basis, but that the year 1897 shows phenomenal strides. The statistics for the first six months of this year were especially obtained from the custom-house, and covering as they do the months of January, February, and March, when traffic was at its lowest—owing to the difficulties of inland transportation, the closing of the ports north of here by ice, and the time when the political situation was very tense—they seem to show that when the books for the year 1898 are balanced, the value of American merchandise imported here will lead all others. It will possibly equal, if not exceed, the values for all Europe.

The value of American flour imported during this period was greater than for the combined years of 1894, 1895, 1896, and 1897, if we take the only fair standard—the customs tael. The gold value for the four years (averaging the haikwan tael for that period at 79.3 cents) was \$43,470.67, against \$41,393.87 (at 68.5 cents) for the dullest six months of the year 1898. This is truly a wonderful increase. No doubt, the presence of the great military camps of Russia, Great Britain, and Germany in this vicinity have had considerable to do with this increase. Further, this is the first year that the customs reports for Chefoo make mention of American flour. American ginseng also makes its first appearance this year. This is all the more remarkable, because hitherto, Chefoo has always been the entrepôt for Korean ginseng entering China.

It is also shown that in 1897, the imports of all our goods were four times as large as those of 1893 (excepting oil, which was a little more than doubled); that the imports for the first six months of this year exceeded those for the entire years of 1893 and 1894 in the case of drills, and in the case of jeans and sheetings, every year excepting 1897.

During the months of July and August, 1898, there were landed from American ships 522,000 gallons oil direct from New York and 420,000 gallons American oil from Shanghai; total value, as per ships' manifest, \$88,000, gold. Thus we have definite records in this office of the importation of our oil for the first seven months of this year totaling 2,397,775 gallons, or more than the total imports of any previous year excepting 1897, and still have five months before the end of the year; not to mention the oil brought in via coasting vessels from Shanghai and overland.

Surely North China presents a better field for us than that depicted in the report by our consul at Canton, and I am confident that he does not exaggerate the danger in the south, for it is reported that the gov-

<sup>&</sup>lt;sup>1</sup> See Advance Sheets No. 221, September 17, Consular Reports No. 218, November, 1898.

ernor of Chêkiang has been approached by Russian agents with the view to buy up the right to sell Russian oil, or rather to farm the oil

tax to them, which means the same thing.

Some years ago, I predicted the inroads that the Sumatran and Russian oil would make in our trade if we did not keep a sharp lookout. While our imports look large, and are large in comparison with some other fields, yet there are at least 25,000,000 people in this province, say, 4,000,000 families. We therefore sell about 1 gallon of oil annually for every family; we ought to sell 10 gallons at least to each family, as the illuminant is either candles or oil.

Of the 76 classes of imports enumerated in the table of imports for 1897, 46 show a gain over 1893—25 from gold-standard countries, of which 3 are from Japan, 4 from the United States, while the only gain from England is cotton yarn. Of the 32 decreases, 8 are from silver-standard countries and 24 from gold-standard countries, of which Great Britain (England and India) suffered losses in 7 classes; Russia, 1; Japan, 1.

The value of the foreign imports into Chefoo in 1897 was 11,625,004 haikwan taels (\$8,602,047 gold), while the value of those goods specific-

ally classed as American was as follows:

Artiol .	Haikwan taels.	United States equivalent.
Drills Jeans Sheetings Flour Kerosene oil Direct imports not included in above list	12, 152 1, 557, 170 9, 767 739, 287	\$361, 825 8, 992 1, 152, 306 7, 197 547, 072 4, 261
Total	2, 813, 086	2, 081, 684

While this is almost one-fourth of the entire value of foreign imports, it is not to be supposed that it represents all our trade; for, as repeatedly stated in previous reports, the data for all the other unenumerated American imports are not obtainable. In the customs classification of foreign imports, the great majority comes from Hongkong, Japan, and other Asiatic countries; and there are many things which we do not compete with, for instance:

Article.	Haikwan taels. United States equivalent.		Article.	Haikwan taels.	United States equiva- lent.

# The value of known English imports in 1897 was:

Article.	Quantity.	Haikwan taels.	United States equivalent.
Drills         pieces           Jeans         do           Sheetings         do           Yarn         pounds           Camlet         pleces           Direct imports from Great Britain	10, 245 6, 350 41, 252 140, 533 720	30, 735 15, 409 131, 514 21, 615 7, 829 81, 101	\$22, 744 11, 403 97, 320 15, 995 5, 793 60, 015
Total		288, 203	213, 270

In this table, I have included every importation specified as English, just as I have included everything specified as American in the tables. A vast quantity of English merchandise is not included for the same reason that applies to American imports; but here we have imports—

	Description.	Haikwan taels.	United States equivalent.
American		2, 813, 082	\$2,081,688 90
British		288, 203	218,270.82

In other words, the value of imports into Chefoo in 1897 specified as American was almost ten times greater than those specified as from Great Britain, and to show that this difference is real, the following comparisons of the same class of goods is made:

Quantity and value of certain classes of merchandise imported into Chefoo in 1897.

Article.	Quantity.	Haikwan taels.	United States equivalent.
American drills	Pieces. 143, 030 10, 245	488, 952 30, 735	\$361, 85 32, 76
Excess American drills	132, 785	458, 217	339, 00
English jeans American jeans	6, 350 <b>4, 260</b>	15, 409 12, 152	11, 40 8, 90
Excess English Jeans	2, 090	8, 257	2, 41
American sheetings. English sheetings.	336, 961 41, 252	1, 557, 170 131, 514	1, 152, 30 97, 35
Excess American sheetings	295, 709	1, 425, 656	1, 054, 96
Value grand total excess American		1, 883, 873 3, 257	1, 394, 06 2, 41
Net value of the excess of American imports of drills, sheetings, and jeans over that of Great Britain in 1897		1, 880, 616	1, 391, 65

I would like very much to be able to present similar comparisons with European countries; but aside from Russian oil, there is no data obtainable.

The quantity and value of kerosene oil imported in 1897 were:

Description.	Quantity.	Haikwan taels.	United States equivalent.
American	Gallons. 5, 281, 060 577, 800	739, 287 70, 960	\$547, 072 52, 510
Excess American	4, 703, 260	068, 827	494, 562

The value of the imports into Chefoo in 1897 specified as American being \$2,081,680.90, gold, it is interesting to know that it exceeds the entire value of our exports in 1897 to any of the following countries:

Bermuda       \$916,050       Peru       \$1,074,97         British Honduras       578, 118       Uruguay       976,44         Newfoundland and Labrador       1,100,926       Aden       627,46         Costa Rica       1,526,915       Dutch and French East Indies       1.577,55         Guatemala       2,057,085       Korea       68,07         Honduras       696,533       Russia, Asiatic       454,64         Nicaragua       1,068,592       Turkey in Asia       148,13	06 63 38 74 40 32

Of the eighty-six political divisions enumerated in the Review of the World's Commerce, 1896-97, pages 26, 27, only twenty-nine show a greater value of our exports than this single Chinese port of Chefoo; and if the returns here could be had as accurately as those given in the Review, perhaps not more than twenty would exceed Chefoo. If we take the value of the imports especially classed American for the three northern ports of China-Tientsin, Niuchwang, and Chefoo-for 1897, as given in my report of the trade of North China as \$8,360,561 gold, our sales in North China were exceeded only by fourteen entire divisions, and exceeded our combined sales to all the Central American The sales of American cotton manufactures in Chefoo alone in 1897 (2,058,274 haikwan taels, or \$1,523,022.76) exceeded those to any country or colony in the whole world, were greater in value than our sales in this line to Great Britian and Ireland and all Europe combined, and represented one-fourth of the entire sales to China. Of American kerosene oil, Chefoo bought 5,281,060 gallons, valued at 739,287 haikwan taels (\$547,072.38), or more than all the Central American States and British Honduras, all the West Indies, and one-sixth of the sales in this line to all China.

<sup>&#</sup>x27;See Advance Sheets No. 145 (June 20); Consular Reports No. 215 (August, 1898).

The Chinkiang tables do not give the value by province, only totals for each class.

No record is given of the transit trade from Tientsin, but it is very In fact, the western part of the district derives most of its supplies from that port. The customs report says:

Inland transit nil, this trade being conducted not through this office, as at other ports, but through the superintendent's (Taotai).

The commissioner at Chefoo says:

Goods conveyed by water to and from nontreaty ports, both by junks and by the Chinese steamer Kwangchi, pay dues at the native custom-house. No dues are collected on merchandise transported by land routes.

The transit-pass system is not generally understood at home, although I have repeatedly written upon this subject. Like the compradore and guild systems, it is the great throttle to commerce. In my report upon Hankau (Consular Reports No. 192, September, 1896, p. 37) I stated:

Collecting customs duties.—There are at least three systems of collecting duty, viz, the custom-houses at the treaty ports, under the supervision of foreigners in the employ of the Government; by the customs entirely, under the management of the native officials at all the coast ports, and over which the so-called foreign customs has no authority; the likin stations, that collect other duties on the goods after landing and when in route for the country.

All merchandise imported pays one full duty at the port of entry. When it is transshipped to another port in China, another half duty, called coast-trade duty, is collected at that port, or when it is sent into the country under transit passes, a transit duty is collected equal to half duty.

Native produce brought down from the interior under transit passes pays half duty at the port of export, and an additional full export duty on leaving the port, no

matter what its destination, whether for a port in China or a foreign port.

Imagine a merchant in Washington purchasing goods in Chicago and having to stop at every city all the way to Washington and have his wares examined and assessed for duty; or shipping goods to Norfolk and have to pay export duty, and then the Norfolk merchant having to get a pass to send the goods on to Richmond and to pay likin or half duty.

It is the likin that has throttled trade. The likin is the greatest hindrance to the cotton trade, as well as to other foreign trades. Remove that obstacle and we have

before us the greatest market in the world.

Chinese guilds as they affect trads.—Next to the likin, and closely associated with it as regards foreign trade, is the guild. Whenever a Chinaman leaves his birthplace, he joins the guild composed of his fellow provincials in the place he happens to be. For instance, all the natives of the Fukien Province residing here, for whatever purpose, belong to the Fukien guild, and all natives of this province residing in Fuchau belong to the Chêkiang guild. These guilds are for self-protection, and each trade or occupation has its own guild—the bankers, fishermen, lorcha, oil, foreign-goods guilds are it is naturally with the last that we are interested for to a greater or guilds, etc. It is naturally with the last that we are interested, for to a greater or less extent it influences our trade.

Quotations from a long and interesting account of the guild by S. T. Laisun followed. In my report on kerosene oil trade (Consular Reports, No. 145, October, 1892, p. 282) I gave examples of this obstruction that came under my official cognizance, and, although those reports were written some years ago, nothing has occurred to change the opinion of all classes; in fact, the system is getting worse.

The likin was established to collect a war revenue at the time of the Taiping rebellion in the sixties. It was not expected to be permanent, but it is still in force. It is true that an effort is being made to place the collection of the likin in the hands of the foreign customs in the Yangtze and Chekiang Provinces, but until the whole system is abolished, we can never hope to have that free and expanding commerce that the needs of this vast Empire justify us in expecting.

It is my opinion that the whole tariff of customs charges should be changed, and that taxes on foreign commerce should be uniform at all places, and not, as now, left to the whims of every local provincial

authority.

Likin is an illegal tax and should be abolished, and goods once entering China should be ever after free of all interior charges, no matter who owns the goods.

As to the guilds, take cottons. English merchants here, in reply to efforts to get them to take up agencies for our mills and do a direct import business with the United States, tell me—

We can not sell a yard of cotton cloth to the natives, even if we offer it, as we have, at a cheaper price than they pay for it in Shanghai. The dealers all belong to the guild, and they are required to buy in Shanghai from their own people, who, in turn, purchase from the foreign merchants.

I am now engaged in an effort to have the merchants buy direct, as they would be able to save all the profits of the foreign merchants, brokers, landing and storing expenses, now incurred at Shanghai. I hope to succeed.

EXPORTS.

Exports of native produce from Chefoo during the year 1897 were as follows:

The most valuable exports, by the above table, were bean cake, which nearly all goes to the southern ports for fertilizing, and wild silk and straw braid, which are sent to Shanghai for transshipment abroad. The felt caps are of a coarse brown-colored shoddy, in shape resembling the old-fashioned Scotch caps that laborers affect in the northern States for winter wear, and are mostly sent to Manchuria or Vladivostok for the Chinese there. The native flour and wheat go to the same market. The mats, straw or rush, are sent to other ports and Vladivostok, where they serve the purpose of burlaps or tarpaulins in covering merchandise. The mules were intended for Saigon. The French had an army officer here the year before, buying large numbers of them. The shoes and boots are either straw or paper, and go to Siberia.

In 1897, a large quantity of bullion gold was shipped to Shanghai. It nearly all came from the surface workings near Port Arthur, and I understand that several shipments of ore from the mines near here are made annually to San Francisco.

During 1897, 58,664 passengers arrived in Chefoo by steamers, and 59,492 left Chefoo, while the foreign population has about doubled over the number two years ago.

Shipping for period ended June 30, 1898.

er.	Tonnage.	1 -	
	Toningo.	Number.	Tonnage.
41 11	212, 431 5, 706	289 10	208, 914 5, 008
66	46, 186	63	46, 141

	18 76	136, 750	

This shows a considerable gain over 1897, and for a period most unfavorable, for reasons before mentioned. During this period, 1 American sailing ship entered with oil—the Challenger, from New York—the only American vessel that has reported to me from an American port

since I have been consul (February, 1890).

While I have written at length on this absence of our shipping, I must add that we need not look for its appearance on the China coast until the opium treaty is abrogated. This compact has driven our flag off of the coast, has not decreased the use of opium by the natives, and it certainly has not put us in a better light, for now it is reported that we supply the more deadly and insidious compound, morphia, to China. No merchant is going to break up his cargo; he will, if possible, send all in one ship. If there is an ounce of opium in the lot, no United States ship will get that cargo. Just as much opium goes into the United States, whether shipped in our vessels or in British steamers. We claim to be a free people, yet we have the only restrictive treaty with China.

TRADE IN 1898.

Imports into Chefoo for period ended June 30.

<sup>\*</sup>The average value of the haikwan tael in the first six months of 1897 was 77 cents, and in the first six months of 1898, 68.5 cents. The fall in exchange accounts for the reduced value of the gain, expressed in gold.

Of the 106 classes of merchandise enumerated in this table, 56 show a gain and 50 a loss, compared with the first six months of 1897. Of the 56 gain, 23 are of European or American, and 33 of Asiatic origin; of the 50 losses, 29 are of Asiatic origin. All American goods increased excepting oil, which shows a loss of 166,325 gallons, accounted for by the presence of the *Challenger*, which arrived June 8, and discharged by July 3 520,000 gallons oil, and the later arrival of the American bark *Evie J. Ray* with 440,000 gallons, causing a temporary cessation of shipments from Shanghai. The manifest value of these two cargoes was \$46,000 and \$42,000, gold, respectively, or \$88,000, gold, for July and August, 1898. These two shipments, of course, would not appear in the above tables.

The quarterly returns do not give values, and the above table was compiled by adding the totals for the two quarterly reports ended

March 30 and June 30, and, as with all the other returns, reducing the piculs to pounds and taels to dollars.

By the courtesy of the commissioner of customs, I was able to secure the following from his books, showing the trade for the first six months of this year.

Description.	Quantity.	Haikwan taels.	United States equivalent.
Total value of foreign imports into Chefoo from January 1 to June 30, 1896		7, 387, 338	\$5, 067, 726. 4
From Great Britain		142, 154	97, 775. 4
From Hongkong			489, 692. 8 31, 294. 2
From Germany			3, 368. 7
From Japan From Taiwan (Formosa)		1, 233, 196	844, 739. 1
From Europe (excepting Germany)	l. <b></b>		36, 814. 6 99, 606. 9
American sheetingspieces	230, 180	805, 630	551, 856. 5
American drillsdodododo		196, 069 7, 112	134, 307. 2 4, 873. 6
Kerosene oilgallons	1, 475, 770	209, 561	142, 549, 2
Flourpoundspounds.	133	60, 429 124	41, 393. 8

Thus, while the total value of foreign imports for the six months ended June 30 was \$5,067,726.43 gold, the value of only five classes of American merchandise (including the direct imports for the same period) totaled \$875,087.60 gold, or \$184,643.67 more than the total value of the combined imports from Great Britain, Hongkong, and all Europe, including Germany; while the direct imports (i. e., merchandise making first entry into China at Chefoo) from Germany are valued at \$3,368.73 gold, or only about a tenth of the direct imports from the United States. I have not included anything in the American totals except goods classed American, no account having been taken of the thousands of dollars' worth of provisions, canned goods, machinery, lumber, etc., which would bring the total value up to the first rank. There is not the least doubt that our trade in the north of China is of paramount importance. It is known that over six ships are under charter with Oregon lumber for work being done by the Russians near here, and already there is a five masted American schooner discharging lumber at Kyao-chau. The custom-house jetty is always crowded and piled high with American merchandise.

Exports from Chefoo for period ended June 30.

Of the 26 classes of exports during the first six months of 1898, 15 show substantial gains over the same period for 1897.

I certified to invoices for the six months ended June 30:

Article.	1897.	1898.	Decrease.	Increase.
Pongees Silk, brown Straw braid.	\$984. 83 25, 992. 42 51, 397. 92	\$320. 73 22, 815. 16 59, 761, 22	\$664. 10 3, 177. 26	<b>\$8, 363.</b> 30
Total	78, 375. 17	82, 897. 11	3, 841. 36	4, 521. 94

This period covers the dull season, and the effects of the war were felt here in an almost total suspension of shipment at one time, but of late, shipments are increasing very rapidly. It may be of interest to know that the total shipments to the Philippines from Shanghai in 1897 amounted to 12,992 haikwan taels (\$9,614), of which all but 2,301 haikwan taels (\$1,703) were from other ports, while within twenty-four hours of the receipt of orders to legalize invoices for Manila, I certified invoices covering straw braid for that city to the value of 5,257.51 Chefoo taels (\$3,653).

### MISSIONARIES.

The missionaries in the interior have had a remarkably peaceful year and not one complaint has been made to me of antiforeign acts. This is the first year that I have been in China that I have known such a record. The antiforeign governor, whom I mentioned in my last annual report was removed, and the present incumbent has evinced a determination to keep order and protect lives and property, showing, as I have always held, that the officials can maintain order if they choose, and that it is not the "stupid people" who are at the bottom of the troubles.

The number of missionaries has gradually increased, and their influence is rapidly growing. I have statistics for only one portion of one mission, the West Shantung Mission of the Presbyterian Church. It has 4 stations, 38 missionaries, 155 helpers, 265 church members, educates 1,011 scholars, and its medical department treated 63,196 patients. Besides this mission, there are the East Shantung Mission of the same church, the American Board of Commissioners for Foreign Missions (Congregational), and representatives of Southern Baptists and Methodists, covering this whole province. On my books, there are 205 names of Americans, against 153 two years ago.

The head of the highest educational institution is Dr. W. A. P. Martin, an American, whose knowledge of Chinese is second to none.

The following is an extract from a report of a missionary trip 300 miles inland:

We went on our wheels to visit the official of a native district, who is very friendly and who last winter paid us a visit, stopping several days. He had often invited us to visit him, and when we decided to go he sent one of his servants, also mounted on a bicycle, to escort us to his yamen. While there we set in order, as best we could, some of his sewing machines, bicycles, etc.

At Chinan, every effort is being made to get foreign inventions, and the governor and gentry tried to get a foreigner to teach science, languages, and general knowledge of the outside world, offering 3,000 Chinan taels, home, etc., but no one seemed to want the place; and now, I suppose, in view of recent political events, no one will dare to renew the scheme.

The following extracts are from a letter recently received from there:

Everything is quiet in this section. Proclamations have, during the past week, been posted up in this city, offering rewards and the right of sale for a number of years to the native who will invent steamships superior to the American Fulton steamship, or great things in general superior to the American submarine ships, American powder, American moving cannons, the English Hotchkiss revolving cannon, the New York and Brooklyn Bridge, the English telegraph system, or the Edison telephone; also offering rewards and patent rights to inventors of useful articles in farming, mining, etc.; again, for writing of useful books on farming, mining, war, business, calculation, geology, etc., and also rewards for those contributing good sums to open up schools of Western sciences and mining. This is all new to these ignorant people in the interior, and several have called on me to ask me what the Brooklyn Bridge was.

In all these changes which are going on in China, the old military tactics are giv-

In all these changes which are going on in China, the old military tactics are giving way, more or less, to our modern ones. A Chinese official recently came to me

to learn some drills.

#### FINANCES.

Roubles to the value of 10,000 haikwan taels were imported from Vladivostok in the spring; a significant item.

Exchange has not shown the marked fluctuations that prevailed in recent years. The common or national coin, the cash, has remained

nearly stationary in its relation to the commercial medium, the Mexican dollar. At one time, late in the fall, the Mexicans were very scarce, almost impossible to obtain, and recourse was had to a large extent to the paper money issued by the Chefoo bank, or, as it is generally known, "Singtai's Bank," a private institution owned by Mr. L. W. Singtai, a gentleman known for his advanced views on all foreign affairs. Besides the bank, he controls or owns several large stores, vineyards, filatures, and, in fact, is the great local factor in all native commercial affairs. His children are being educated in Paris.

One of the greatest needs of the American merchant is an American bank in China. There is a large field for it, and I feel confident that if one of our New York banking houses established a branch in Shanghai, it would reap a handsome reward. There are in China, French, Russian, German, and several English banks; and it is through these that all United States trade is conducted, involving a great loss to our commerce. I have hopes that ere long, someone will prove enterprising enough to enter this field. There is none more profitable in the world. The Hongkong and Shanghai Bank's shares sell at 215 per cent premium.

In China, no licenses for carrying on business are required except at some of the ports. The local rules adopted by the foreign community tax certain classes. At Chefoo all are free to carry on any business.

# PASSPORTS, POSTAL REGULATIONS, ETC.

It is now required to have passports to enter Port Arthur, but none are required by the Germans at Tsingtau, or the British at Weihaiwei. I am told that the Russian consulate here takes in more fees than any other of that nationality, excepting the one at Constantinople.

During the past year few, if any, changes have been made in the customs rules or port regulations. The post-office under the control of the customs has proved itself, as was prognosticated at the time of its assuming such functions, totally unfit for such work. Its rules have been changed and each time for the worse, so that it is not profitable to enumerate them here. Charges of every description and under every pretext are inflicted upon the foreigner's mails, great inconvenience and loss to all classes have resulted, and even the customs officials admit that the system is a failure. All this I have already reported, but I again venture to point out the harm that the parcel rules are doing to our trade.

Thousands of dollars worth of small articles are sent to China in the United States mails.

The condition of living is such that few, if any, of those thousand and one things so essential to civilized people are produced in China; consequently, an immense traffic has grown up between the United States and China by means of the mails, and so long as these were under the control of the consuls, there was no complaint. Now China having obtained control, not only do our merchants at home and in China suffer, as well as all foreigners in the ports, and more especially the missionaries in the interior, but we are in danger of losing all the above-mentioned trade.

It is the hope of every foreigner in China that the powers, or those interested, will again take charge of their mails, as they, by treaties, have a right to do.

## WHARFAGE.

Some two years ago, the home press was discussing a Reuter's telegram that the Russians had seized the Chefoo fore shore. On my arrival, in July, 1896, I investigated the subject and reported it to the

legation.

In the spring of 1896, an American citizen, Mr. L. H. Smith, on behalf of the Russian firm of Sheveleff & Co., of Siberia, purchased from the Chinese Government, for 3,000 Mexican dollars, a small strip of land, partly covered at high water, situated in front of Fergusson & Co.'s. This land was claimed by Fergusson & Co. as their property; however, after considerable correspondence, the matter was adjusted by the Chinese Government paying 30,000 Chefoo taels as damages to Fergusson & Co., and the work of filling in went on. Plans drawn up at the time are herewith inclosed.1 The work is now completed; it cost the Chinese Government at least 100,000 Mexican dollars. It was the intention, and I believe it was understood by the consular body that the respective ministers had agreed to it, to impose a small tax on the imports and exports to reimburse China; but as I had not been consulted, I wrote to Minister Denby protesting against it, as at the lowest calculation it meant a tax of \$4,000 on American imports. The tax has not been imposed.

Aside from the large area retained, the greater part of which belongs to Sheveleff & Co. and Fergusson & Co., giving a good frontage to the harbor, the work itself has not proved as beneficial as was expected. It is impossible for the lightest draft steamers to go alongside, and at low water, even gigs ground in going to their landing place. Nevertheless, instead of the unsightly mud flats there are presented a good, clear

granite wall and high, dry roads.

The customs jetty is a disgrace to the port, being a long, narrow stone structure, uncovered, and by the orders of the commissioner, all merchandise must be placed on this jetty until examined and passed by the customs men. It is a common sight to see iron, soap, casks of wines, bales of cotton cloth, delicate machinery, in fact, all kinds and classes of merchandise, exposed to the elements and often flooded with rain. At no other port in China does such a disgraceful state of affairs exist. While the customs officials retain this merchandise, they refuse all responsibility. The jetty should be roofed over, or, failing that, the system in vogue in other ports, of passing the goods direct to the shipping agents' warehouses, holding the agent responsible for duties, etc., should be allowed.

The merchants here have repeatedly petitioned for this right and offered their warehouses, but without avail. This exposure to the weather causes a great loss. American goods, particularly cottons, suffer considerably.

### TELEGRAPHIC SYSTEM.

The telegraphic system of China has of late deteriorated. Many times during the past year the wires have been out of order, and weeks have elapsed before they were repaired. After every thunderstorm the excuse would be "wires down." At no time in the history of China has there been such a demand on the system, owing to the political excitement and increased commercial activity. At last, affairs became so unbearable that the foreign community and commercial bodies at

<sup>&</sup>lt;sup>1</sup> Filed for reference in Bureau of Foreign Commerce, Department of State,

Tientsin and Shanghai pressed upon the administration the absolute necessity for an improvement, and a double line is now in course of erection across the province, and it is to be hoped that an improvement in the service will be the result. The cost of telegrams is very dear, including, as it does, the address and signature, and the minimum charge being for seven words.

### MARKING GOODS.

There are no laws requiring goods to be marked so as to show the country of origin, but it is a common practice and is to be commended. It is pleasing to walk along the jetty and see so many bales marked "From U. S. A." or "Made in the United States." They serve as an advertisement.

## COTTON TEXTILES.

The market in North China has been steadily improving, and there seems to be no indication that it will decrease. The colder and more vigorous climate calls for a heavier cotton than is used in the south, hence, American makes virtually control this market.

The following, from the cotton trade reports, will be of interest:

[From the North-China Daily News. Shanghai, September 20, 1898.]

Piece goods.—There is more doing among the natives, and quite a fair amount of cargo has changed hands this week, but importers have participated to a very small extent, being altogether unwilling to countenance the low rates goods are being resold at. Of course, so long as the merchants can obtain what they want on their own terms from native sources, or the auctions, holders must perforce abide their time and rest satisfied for the present that, although the outside markets are not over strong, goods are being cleared and going into consumption. Tientsin is buying American makes, both drills and sheetings, but the market for these has been more or less upset lately by some erratic sales from first hands. There are buyers, in fact, for all markets if prices are cheap, though there are still complaints of the dearness of money. Clearances continue moderately satisfactory for most quarters, Korea again distinguishing herself in that respect this week.

Cotton is slightly easier this week, to-day's quotation from Liverpool being 3.4d. It can be laid down here, according to private telegrams, at 34d. c. f. and i. The export of plain cottons for the last two weeks was only 9,000,000 yards. We have not heard of any fresh business in New York for this market during the week under review, prices there keeping steady to firm. It is said that purchases for China, for shipment in time for the new season, amount to 15,000 bales already, but we have

not had this confirmed.

The yarn market is still in a very depressed state, both here and in the south, so much so that holders in Hongkong have telegraphed to the Bombay Mill Owners' Association, urging them to curtail production. The reply was that the question

would be considered, provided the China and Japan mills cooperate.

Reverting to what we wrote last week with reference to the fruits of the Blackburn mission to China, there is a way by which the Lancashire trade with this country can be preserved, but it will require very powerful syndicates to effect the necessary changes, as it will involve a reform of the Manchester trade as at present The most essential point is for the manufacturers to combine to do away carried on. with middlemen as soon as practicable, and deal direct with the representatives of the China houses, doing their own making up, ticketing, packing and shipping, etc., and so save the heavy expense that a bale of shirtings has to incur now before it reaches the hands of the buyer, as is done in the United States and Canada. The trade will then be placed more on a parity with that of the United States, and could successfully compete even with the heavy makes of drills and sheetings that are now being fast cut out. All that vast system of rebates and discounts that is despoiling the trade must be done away with, or, so surely as China's former valuable tea trade has dwindled into insignificance, from very similar causes, will the Lancashire trade with this country gradually pass into other hands. This course, of necessity, will cause the Manchester firms to join the manufacturers' syndicates or opening houses in China, but what must come is a reduction of the heavy needless expenses at present incurred. Reform is wanted all along the line, not forgetting the monopoly formed by that powerful combination that controls the steamer

service to the East, composed entirely of British companies, that carry alien cargo 25 to 30 per cent cheaper than that of their own country, as an actual statement of facts show, the freights paid from New York for the past two or three years having varied from 27s. 6d. to 32s. while Manchester has been paying 35s. to 42s. 6d. Let Lancashire manufacturers bestir themselves, and, if necessary, form themselves into syndicates so as to be able to put their trade on a more equable footing with that of rival and competing countries.

The cotton-cloth trade of China is of the greatest importance to us, as China buys more than one-third of our total exports in this line, and the northern ports take nearly all that comes to China. I have repeatedly urged merchants here to make direct importations, but they are not inclined to push out. British merchants do not wish to take up new ventures. If the American mills had their own men here to push sales, I have no doubt a rapid increase would result. I would earnestly urge our manufacturers to attend to their own business in China, and not leave it to aliens. Direct shipments would enable them to undersell Shanghai, compete against the guilds, and if the Pacific steamers would call here, to or from the United States, I think that they would be able to get all that cargo which now leaves Tientsin, Chefoo, and New-Chwang to be taken up at Shanghai, and the steamers could of course discharge here all cargo intended for the northern ports. The harbor is good; several men-of-war of over 14,000 tons call here, and find plenty of water.

### GENERAL REMARKS.

In my annual report of trade, dated October 14, 1897, I mentioned the interest taken in Kiao Chau Bay (Shantung) and its importance as a port, and added:

It is a wonder to all that that harbor has not been opened to commerce. I trust that our Government will use its best efforts to obtain that end, for, once accomplished, it will be of vast benefit to our trade.

A month to the day later, on November 14, the Germans occupied and seized that bay and the adjacent territory, and on the 3d of October, the land not required by the German Government was sold at public auction. The Chinese Government is to open a custom-house under foreign supervision at Tsingtau, the railway routes are being surveyed, mines (which seem to have been owned by Li Hung Chang) exploited, the province covered in every direction by experts, and the German port being free, it will be strange if Shantung does not receive her foreign imports from that port. I hear that during the last three months, 3,000 bales of piece goods have been landed in Tsingtau; some of this was American, but how much I can not say. When the customs are regularly opened, no doubt exact figures can be obtained. A friend of mine informs me that he saw several loads of cloth with "Massachusetts Mills" stamped on them.

There is a good deal of activity there now; very wide streets are being graded, drainage arranged for, and foundations for some build-

ings laid.

The land sold at auction went at rather high prices—from \$250 to \$600 (Mexican) per man (one-sixth of an acre), according to location—the total amount being nearly \$100,000 the first day. Chefoo parties invested extensively. The best land is now all sold.

There is a good deal of grumbling among business men over the numerous conditions imposed on buyers, but no doubt there will gradually be concessions that will mend matters. Tsingtau undoubtedly

has a great future before it, unless the commercial interests become swamped under the military. At present, there are in that harbor two coaling steamers and United States sailing ship—Louis—besides the men-of-war.

The American ship *Louis*, with lumber, was ordered to anchor by the harbor master in a certain place. The captain told the harbor master that the position was dangerous, but he had to remain there. A strong breeze came up, and the ship smashed her rudders, rudderpost, and

damaged her keel. This is not encouraging to shipping.

There are 1,500 foreigners there now, nearly all Germans, but, singularly, the Germans here do not seem to have much faith in the future of the place, while the British think that Tsingtau will be the ruin of Chefoo. I think that if the British at Weihaiwei open their port to trade, build a railway to Chefoo, and then to Tengchow, Weitsien, and Chinan, to connect with the main lines running from Tientsin to Shanghai, all the trade will be in their hands, as they have the better harbor and more experience in such matters. I inclose tracing of a map of Tsingtau, drawn by German authority September, 1898.

The occupation of Port Arthur by the Russians and of Weihaiwei by the British has brought North China into the greatest prominence. The trade of this part of China is steadily increasing, and the activity of the Russians has given to Americans large and lucrative orders for

lumber, rails, and other materials.

The provisioning of 20,000 Russian troops at Port Arthur, of the large force of Germans at Tsingtau, and of the British fleet at Weihaiwei has devolved to a great extent upon the merchants of this port. One effect of this is seen in the returns for flour for the quarter ended June 30, 1898, the value of which was 46,796 haikwan taels (at \$0.67.3 = \$31,491.91 gold), against 9,767 haikwan taels (at \$0.73.97 = \$7,224.65 gold) for the calendar year of 1897; and it is to be presumed that other lines fared equally as well. A German firm here has the contract for provisioning Port Arthur and Tsingtau, and a British firm does the same for Weihaiwei.

It is expected that the railway work planned for this province will be started in the early spring, but none of the lines contemplate approach-

ing Chefoo.

The Yellow River, "China's Sorrow," has again broken loose, and a vast territory is flooded, entailing great distress. The Emperor, at the request of the governor, has remitted a large percentage of the taxes, in order to lighten the burdens of the sufferers. On the whole, Chefoo has had an exciting year. First, the murder by robbers of the two German priests near Chiningchau in November, followed by the seizure of Kiao Chau Bay, the demonstration of the British fleet in this harbor, the occupation of Port Arthur and Talienwan by the Russians, the evacuation of Weihaiwei by the Japanese and subsequent occupation by the British, the throwing open as a free port of Tsingtau by Germany, the floods in the valley of the Yellow River, and the consequent increased number of strangers, have all tended to keep Shantung before the public.

## SUGGESTIONS.

I renew my suggestions that the United States be represented by its own consuls at Newchwang and other ports in China not represented; that museums be established at Canton, Hankau, Shanghai, and Tientsin for the exhibition and sale of American merchandise, etc.

<sup>&</sup>lt;sup>1</sup> Filed for reference in the Bureau of Foreign Commerce, Department of State.

Digitized by

At nearly all of the stations the missionaries have museums, where can be seen models of guns, ships, curios, and other articles that will interest the native mind. Most of the mechanical models are made by the missionaries themselves. Dr. Mateer is quite a genius; he has given electric railways, cars, engines, etc., made by himself, to the museum in this city. There is also a large and most interesting collection of birds, reptiles, and animals, captured in this province and Chekiang, all mounted by Rev. Mr. Bergen in the most artistic and scientific manner. It has occurred to me that no doubt our manufacturers have thousands of models, or samples, which they could well send to this museum, thus advertising their lines, and I know of no better way to show their goods than this. If merchants will send, free of expense, such articles as they can spare, and wish to advertise, I will

see that they are properly placed.

The museum here is on the main street, and is directly under the control of Rev. Dr. Hunter Corbett, of the Presbyterian Church. Samples of cloth, toys, canned goods, mechanical appliances, models, illustrations—in fact, every line excepting, of course, liquors, tobacco, or such things as missionaries can not consistently extol. Besides this museum, they have one at Weitsien, Ichowfee, Chinan, and several other smaller places. This is an excellent opportunity for our merchants. The museum is in a very large stone building, with ten or fifteen rooms for exhibits. I would further suggest that a bank be established; that a newspaper be published; that the opium treaty be abrogated; that our shipping be protected; that mail steamers call here to or from the United States; that fire insurance companies enter this field (there is not one American company in China; the inclosed prospectus will show how rich the field is, and the same may be said of marine insurance); that Americans place their interests in the hands of their own countrymen; that we refuse again to intrust our mails to China, and place the system where it was two years ago; above all, that we take a firm and decided stand in North China, and not allow our interests to be interfered with.

JOHN FOWLER, Consul.

CHEFOO, October 24, 1898.

### PROSPECTUS OF THE SHANGHAI FIRE INSURANCE COMPANY, LIMITED.

1. The enormous volume of fire-insurance business now transacted in Shanghai is of itself sufficient reason for the formation of a new local company.

2. The opening up of China to railways, the establishment of numerous industrial enterprises, and the ever-increasing native and foreign trade, must be followed by a corresponding increase in the demand for insurance against fire.

3. The probable extension of the foreign settlements in Shanghai, the opening of

Woosing and other treaty ports, as also the increase of territory ceded to foreign nations, should be followed by a large addition to properties requiring insurance.

4. Two very successful offices, domiciled in Hongkong, have for many years justly commanded a large share of the fire-insurance business in China, but they are unable to satisfy the demand, and consequently, a large number of fire risks are placed with European and Australian companies. The shares of the Hongkong Fire Insurance Company, Limited, with \$50 paid up, are now quoted at \$330, and those of the China Fire Insurance Company, Limited, with \$20 paid up, are quoted at \$95. The success of these two old companies forms the best encouragement to investors who are willing to take shares in the new one.

5. The Chinese now thoroughly recognize the necessity of fire insurance, and as they are among the largest owners of properties and merchandise at Shanghai and at most of the treaty ports, the Shanghai Fire Insurance Company, Limited, will, it is expected, receive a large measure of support from them. This expectation is indeed assured by the cooperation of the three Chinese gentlemen who join the

6. It is proposed to act in concert with the other fire companies as regards rates, so long as the directors are assured of the general adherence to tariffs. It may be advanced by some insurers that the present rates are somewhat high, but the experience of many years has taught all fire offices that a proper and adequate charge must be made, if a company is to be permanently prosperous and if shareholders are

to receive regular and substantial dividends.
7. It is further proposed that the subdivision of profits shall be, as far as possible, on the lines followed by the existing local companies, viz, that after payment of such dividends as may be recommended by the board of directors the residue shall be appropriated toward the creation of a reserve fund and to a return to contributing shareholders.

No promotion money has been or will be paid.

9. Where no allotment is made, the deposit will be returned in full in exchange for bankers' receipt, but when any shares less than the number applied for are allotted, the balance of the deposit will be credited to the sum to be paid on allotment.

10. The shareholders' liability is strictly limited.

11. Prospectuses and forms of application for shares can be obtained at the company's temporary offices, 22 Kiangse road, Shanghai, or from the bankers of the company at Shanghai, Hongkong, and the treaty ports of China and Japan.

SHANGHAI, October 1, 1898.

## SUGGESTIONS FOR DEVELOPING TRADE IN CHINA.

Minister Conger sends from Pekin, under date of October 12, 1898, a copy of a letter from Consul Fowler, of Chefoo, containing suggestions for the development of American trade in China. Mr. Fowler urges the construction of the Nicaragua Canal. He deprecates placing American enterprises in the hands of foreigners, and cites that Chefoo bought over \$3,000,000 worth of merchandise from the United States last year, not a dollar's worth of which was sold by Americans in the city. If the customs reports could be made out so as to credit the country of shipment with the goods bought or sold, instead of the port of transshipment as at present, it would benefit United States trade. He urges the importance of a newspaper controlled by Americans; the establishment of museums at Canton, Shanghai, Hankau, and Tientsin for the display of merchandise; the establishment of an American bank, and the discouragement of the amalgamation of United States mail lines with foreign lines.

#### CHINKIANG.

Chinkiang, the treaty port of this district, though 150 miles from Shanghai, the nearest seaport, is nevertheless a large distributing center, being located almost at the entrance of the Grand Canal from the north into the Yangtze Kiang. This canal now being open to steam navigation and foreign shipping under the new inland water regulations, will no doubt add importance to this port as a distributing center.

There are four regular lines of steamers running on the Yangtze Kiang, besides many known as outside steamers. These four lines have hulks of their own at our bund, on which they load and unload freight. Every day, we have from one to three steam vessels discharging cargo that goes into the interior, and taking cargo for export or for other Chi-

nese ports.

The British have a concession here, and almost all the trade of the port and interior through this port is controlled by the agents of these lines. There are no foreign merchants in the port who carry a stock of any kind. It would seem to me that an importing firm that would establish itself here and study the market could do a large business

within a radius of many miles from this port.

It is now a custom with two or three retail firms at Shanghai, once or twice a year, to send out a man to call at the various ports from Shanghai to Hankau, with eight or ten boxes of dry goods, which they offer at prices high enough to give a profit at Shanghai and an extra one for general purposes. We have two Chinese stores that carry American wines, canned goods, hams, and bacon. Many more carry American oil lamps and clocks. These seem to hold the market against all comers. It is almost impossible to secure any comprehensive statement of the volume in different lines of goods for 1897 as compared with 1896, as no statistics are kept, except at the treaty port (Chinkiang), although there are many other ports in the district open to native commerce, but controlled by native customs, that are usually farmed out, so that it becomes a part of the interest of those farming them to prevent any information as to the volume of trade being given.

At Chinkiang, we have two silk-filature works, established in 1896 by the Chinese, with Chinese capital. One of them is closed, owing to losses on production. The other is running, but not doing very well. It is in the name of a foreigner, who tells me he gets a certain sum every month for the foreign protection secured to them through his name. The high price of coal (about \$15 Mexican, or \$7.11 gold, per ton), together

with the high price of cocoons, prevents profitable working.

The output of the one in operation for the eighteen months ending December, 1897, was 354 pounds of white silk; for the six months end-

ing June 30, 1898, 359 pounds.

The cost of cocoons during 1897-98 was about \$50.40 per hundred pounds, while the silk made therefrom sold for about \$280 per hundred pounds. It is sold to dealers in Shanghai, but its final destination I do not know. The export duty on this silk is 10 taels per picul, or about

\$4.84 per hundredweight.

Another industry here that is growing rapidly is the manufacture of albumen from eggs. The yolks are utilized for dyes, but the process is a secret. Ducks' eggs are used, and they are so cheap—costing not over \$3.80 per 1,000, delivered—that the business is very profitable. In 1896, the managers established the factory and invested about \$11,000. In 1897, they enlarged their capital to about \$16,000. During 1898, they have again enlarged the business and increased their capital to about \$36,000, and have established three or four other factories.

There is a good opening here for American capital in this business, while we have a very large market at home for the product. They ship

most of their product to Germany.

There is also another concern started here in a small way, by an Englishman, for preserving and exporting hens' eggs. Their cost is less than \$4 per thousand, and it is said they will last indefinitely. No details can be secured about the business. Small quantities are sent to England.

At the city of Nankin, the Chinese manufacture satin, amounting to about 1,800 pounds per year. The output is increasing at the rate of about 150 pounds annually. It sells by the piece, a yard wide, for about 80 cents per yard, best quality; second quality costs about two-thirds of this price. They also do a small business in the manufacture of silk ribbons, but the output does not amount to over \$600 worth per year. A good business is done, however, in buying and exporting cowhides, sheepskins, and goatskins, most of them being sent to England.

Wuhu, another river city in this district, has a factory for the manufacture of albumen, owned by the German firm that owns the one in

Chinkiang, and the same conditions apply to both.

There are coal, iron, and other minerals in the hills adjacent to Wuhu,

but no systematic effort has been made to mine them.

Concerning markets for American goods, there is a good field. This being a large distributing center, great quantities of cotton and woolen manufactures are sent from here. While the natives like American cotton goods very much, the prices seem to keep them out, native cottons underselling them. The labor in manufacturing native goods

costs from 7 to 10 cents per day.

With agricultural implements, conditions are different. The Chinese do not have them and can not make them. Their farming is of the most primitive kind. It would seem that American light plows, harrows, hoes, rakes, spades, and small axes or hatchets would find a good market here; and various domestic utensils, such as knives, spoons, razors, scissors, boilers, light hardware, and carpenters' tools should sell readily.

The soil is fertile, the people are temperate, frugal, and industrious, and with a decent government, just laws, and fair protection against

squeezes and rapacity, they ought to prosper.

WM. MARTIN, Consul,

CHINKIANG, October 31, 1898.

# CHUNG KING.

I inclose a set of tables compiled from the returns of the imperial maritime customs at this port, giving the imports and exports for the fiscal year ending June 30, 1898, with market values, as near as can be ascertained, reduced to United States gold.

I also inclose as a fit accompaniment, an abstract from a report by Mr. F. S. A. Bourne, who accompanied the Blackburn Commission, on its expedition to this district for trade purposes, in the winter of 1896-97.

## IMPORTS IN 1898.

The principal articles of import from foreign countries and Chinese ports during the half year ending June 30, 1898, as compared with the same period of the previous year, have been as follows:

Article.	1897.	1898.
Cotton goods:           Shirtings—         Gray, plain.         pieces.           White.         do.           White Irishes.         do.           Dyed, figured.         do.           T-cloth.         do.           Drills, American.         do.           S. tings, English.         do.           Cotton prints, plain.         do.	188, 439 21, 857 5, 530 1, 748 2, 100 3, 166 11, 960 9, 840	273, 506 29, 776 2, 900 190 2, 070 7, 481 11, 483

Abstract from a report on the trade of West China by F. S. A. Bourne, in charge of the Blackburn Commercial Mission.

On December 25 we reached Chung King, the commercial capital of Szechuan. The map will show the commanding position it occupies in respect of the exchange of products between the lower Yangtse valley and Szechuan, with every considerable town of which it is connected by water, and it must be borne in mind that whole-sale trade is carried on almost entirely here by boat. Exports bound for the Lower Yangtze and abroad must pass it, and so must the imports brought up in exchange. The result is that, in regard to foreign trade entirely, and in regard to interprovincial trade to a very large extent, Chung King is the wholesale market for the province, and the only one. Here it is that the merchants and shopkeepers of the whole province come to buy foreign goods. The city is as busy as any in the Empire, but it is confined within a narrow area by its physical conditions, though this area is very thickly covered with houses. It is built on a peninsula of sandstone hills lying between the Yangtze and its northern tributary, and rising gradually from 100 to 400 feet above the winter level of those rivers. As the Yangtze rises here some 90 feet in summer above its winter level, the ground below this huge reef, if so it may be called, is flooded every year and only accommodates mat sheds. Warehouses and shops have to find room on the reef, which is therefore very crowded.

### SZECHUAN TRADE.

Szechuan exports chiefly raw or half-manufactured produce, as opium, salt, drugs, and raw silk. Her chief imports are raw cotton, native cotton cloth, and foreign goods—that is, goods imported into Shanghai from abroad—of which Lancashire cottons constitute about 30 per cent and Indian yarn 44 per cent. There are no returns to consult, but I will risk an estimate of the exports from the whole province of Szechuan to the eastern provinces at £3,300,000.

and other exports		2, 919, 900
Total	3, 300, 000	16, 059, 450

Of the imports taken in return, cotton and cotton goods I estimate to account for no less than £2,400,000 value:

Article.	Value.	United States equivalent.
Raw cotton (290,000 bales)	£500, 000 1, 000, 000 600, 000 300, 000	\$2, 433, 250 4, 866, 500 2, 919, 900 1, 459, 950
Total	2, 400, 000	11, 679, 600

In regard to Lancashire goods, to which our inquiries were chiefly directed, the following table shows the import of the most important items during the last three years:

Article.	1894.	1895.	1896.
Gray shirtings Cotton Italians Cotton lastings. White shirtings. Cotton prints	36, 496 17, 760 42, 409	Pieces. 511, 455 44, 112 36, 761 55, 918 26, 663	Pieces. 374, 542 58, 096 38, 590 60, 965 83, 632

There is, besides, a small import of these goods to Wan Hsien from Ichang under transit pass, and a small import into Chung King from Hankau in the same manner. No doubt, some go by likin boat, and a considerable quantity is smuggled; but the above table, taken from the imperial maritime customs returns, represents the great bulk and the tendency of the trade; 1896 was a bad year, for the new rapid blocked the trade during the last three months. Nevertheless, it will be noticed that cotton Italians, lastings, and prints more than held their own, and this is the clear tendency of the trade, namely, that we lose ground in the commoner cloth, but can gain greatly, if our manufacturers and merchants choose, in fine and figured cloths. No doubt, the commoner shirtings are being superseded by native cloth woven by hand from imported yarn, and for this there seems no help.

#### FOREIGN IMPORT TRADE.

I was told by a Chung King native merchant, who had frequently been down to Shanghai as a buyer, that the foreign cotton-goods trade is carried on as follows: The Chinese foreign piece goods merchants of Shanghai, some of whom act also as brokers, order from the British importing merchants for future delivery. There are only two British firms in Shanghai that will not order on commission for Chinese, but themselves do merchant's business solely, selling their own goods. When the bargain is made, the rate of exchange is settled from sterling to silver. Delivery of the goods is given in exchange for draft at five days' sight on a native bank. The Szechuan merchant sends down his own partner or agent to buy for him in Shanghai, and he employs a Shanghai native merchant or broker to contract for him with the foreign importer. To this broker, the foreign merchants pay one-half per cent commission, out of which the broker has to pay part of the shipping charges. The Szechuan agent, to make sure that he is not being swindled by the Shanghai native broker, can go and inspect the contract book at the foreign merchant's hong. If the goods do not arrive within four weeks of the contract date, the Szechuan agent need not take them; if payment is not made within two weeks—sometimes four weeks—the 5 per cent deposit required from persons not well known to the foreign merchant can be forfeited. More than half the men sent down from Chung King to buy in Shanghai have an interest in the business. Such an agent would be paid 10 taels (30s.) a month and expenses. Szechuan merchants do not employ Shanghai native merchants as their permanent agents, but send their own men. Such a man would leave Chung King in August and return in May; letters would reach him every five days with instructions. There is scarcely any buying in Shanghai for Szechuan from April to August. Goods are sent by steamer to Ichang and on by native boat in charge of a supercarge or junk owner. About one-tenth part arrive damaged by water, but practically no goods are lost. The Szechuan agent would be glad to go direct to the foreign merchant, but he can not speak English.

The Chung King merchant pays ready money in Shanghai, but he sells to the Szechuan upcountry merchant on long credit. (See next section.) The chief marketssubsidiary to Chung King are, (1) Sui-ning Hsien (latitude 30° 28', longitude 105° 45'), which supplies Tung-ch'uan Fu (latitude 31° 09', longitude 105° 11'), and Paoning Fu (latitude 31° 32', longitude 105° 59'); (2) Chêngtu, the capital; (3) Chiating Fu (latitude 29° 28', longitude 103° 55'); (4) Sui Fu; (5) Lu chow (latitude 28° 56', longitude 105° 33'); and (6) Wan Hsien. At Chêngtu there are three, and at Chia-ting one, houses that buy directly in Shanghai, otherwise the whole of Szechuan buys in Chung King.

buys in Chung King.

### TRADE BETWEEN CHUNG KING AND UPCOUNTRY.

Bargains in the Lancashire cotton-goods trade in Chung King are customarily made under the following terms as to payment. There are three settling days, namely: New Year's eve, the fifth of the fifth moon, and the fifteenth of the eighth moon, and payment is made on the next settling day but one after the date of purchase. Thus, a contract made between the first of the first moon and the fifth of the fifth moon would be for payment on the fifteenth of the eighth moon—that is to say, on the average, five to six months' credit is given. But the purchaser has the right to pay cash at any time he chooses, and he is then allowed by the seller a discount in the case of foreign cotton goods at the rate of 1½ per cent per month—that is, 14½ per cent per annum, and in the case of foreign yarns, at the rate of 1½ per cent per month—that is, 18¹ per cent per annum. Interest being so high, the seller, of course, wishes payment to be delayed as long as possible, while it is to the interest of the purchaser to pay as soon as he can. In fact, it would seem that the high interest includes insurance against risk of loss, although the natives do not regard

<sup>&</sup>lt;sup>1</sup>More than this really, as the Chinese follow the lunar month, and there are accordingly intercalary months from time to time.

it in that way. The system may have the advantage of encouraging poor men to

push the sale of goods, but it has many drawbacks.

Payment is made in silver, by weight, according to the huo-p'ing, goods balance, which is 8 per mille heavier than the Yii-p'ing, Chung King balance, which is about 2 per cent lighter than the tou-kuei p'ing, the Shanghai balance, the ounce or tael of which is valued in this report at 2s. 104d., the rate ruling in Shanghai when we left that place in October, 1896.

However, before we can arrive at the value of the Chung King tael or local ounce, another factor has to be considered, namely, touch or quality of silver. By custom, all bargains in the foreign piece-goods trade are made for payment in hsin p'ias or best silver, which bears the following proportion to Shanghai silver, Chung King,

931.5; Shanghai, 1,000.

Therefore, allowing for difference, both in weight and touch, par values would be, Chung King taels 952 equal Shanghai taels 1,000; that is, 1 Shanghai tael equals 954 Chung King tael cents. The Shanghai tael being 2s. 104d., the Chung King tael (Yii-p'ing) will be 3s. 04d.

But, in fact, exchange between Chung King and Shanghai is always in favor of Chung King. While the river is in flood from June to September, 1,000 taels in Shanghai can often be bought for 880 taels in Chung King. In winter, when communication is easier, exchange sometimes rises from 920 to 940 taels, but never to par. This heavy premium seems to be caused by the excess in value of exports over imports and the difficulty of sending up specie, for I was told that when exchange in Chung King does rise, it is due to Government remittances from Szechuan, and that the premium has been greatly increased by the huge export of Szechuan opium in recent years. This premium, say 6 per cent in summer, is of course a great assistance to the importers of foreign goods, and several merchants told me that it made their whole profit on Lancashire cloth.

#### TRADE DISCOUNTS.

Besides the discount for cash, custom has established several regular trade dis-

counts, subject to which every bargain is made.

The first is a long-established trade deduction of 92.2:100 (this is the way the Chinese state discounts); that is, 7\$ per cent. This is said to be an old custom that has been going on in the foreign import trade for fifty years, and to be derived from early days in Canton. The second discount is 99:100—that is, 1 per cent—said to have come into vogue shortly after Hankau was opened to trade in 1861 to cover small blemishes in the goods. The third, 94.2:100, or 5\frac{1}{2} per cent, is a discount allowed in consideration of payment being required in hein p'ias, i. e., the best silver. There had been many attempts to pay in inferior silver, and this discount was established to make payment in good silver compulsory. These three discounts

amount to 14.02 per cent on the contract price.

In the above sections, I have given all the main conditions of a bargain in Chung King according to the custom of the foreign piece-goods trade. My object is to show once for all, so far as this report is concerned, how needlessly intricate these rules are.

# COMPARISON OF CHUNG KING WITH SHANGHAI PRICES.

On January 6, 1897 (twelfth moon, fourth day), the market price in Chung King of a piece of Kung-pring (Iveson & Co.) British soldier C. C. C. "chop" 12 pounds gray shirtings was 4.3 taels. This meant that on the fifth day of fifth moon a purchaser had to pay a seller 4.3 taels less 14.02 per cent, as above—that is, 3.69 taels—but that he could pay ready money if he chose at the rate of 1½ per cent discount per month. Five months make 6 per cent. The ready money price, therefore, was 3.46 taels huo-p'ing, equals 3.48 taels Yü-p'ing. At par, this equals Shanghai 3.65 taels (10s. 6½d.). The price of this "ohop" in Shanghai in October, 1896, was 3.45 taels (9s. 11½d.). Add freight and insurance Shanghai to Ichang, 3 tael cents, and Ichang to Chung King, 10 tael cents, and the laying down price in Chung King, without allowance for insurance from Ichang or interest on capital, would be Shanghai 3.58 taels. So that the Chung King merchant has to look to his profit on exchange, referred to above, and to his chance of high interest on payment deferred to the due date for his profit. It should be noted that trade was bad while we were in Chung King, because of the floods of the autumn of 1896.

### COTTON YARN AND OTHER GOODS.

Contracts for the sale in Chung King of cotton yarn are subject to the same terms, except that five to seven months' credit is given, and that the discount for earlier payment is at the rate of 11 per cent per month.

### DYES AND MISCELLANEOUS FOREIGN GOODS.

Terms are the same, except that eight months' credit is given, that payment is made in lao-p'iao—good second-class silver—at a discount of 6 per cent on the purchase price, 1½ per cent discount per month being allowed.

#### BANKING.

Exchange banks—that is, banks selling drafts on distant places—are almost all in the hands of men of the Shansi Province, who here, as everywhere in China, excel in this business. They have worked out among themselves a very high commercial morality by centuries of rigorous domestic discipline. If an employee defrauds a Shansi bank no appeal is made to the law or the magistrate. He is sent home to his native district, tried by his family elders, and treated in a very drastic manner, sometimes, it is said, buried alive. There are 17 Shansi banks doing business in Chung King, and 20 large cash shops or local banks exchanging cash against silver, and vice versa. An average exchange bank would lend about 200,000 taels here to business houses on personal security, on which they would pay 10 to 12 per cent per annum. This is security given to the public that the bank can meet its drafts. A piece-goods merchant with ample resources told me he would have to give 7 to 12 per cent per annum for such an advance, according to the state of the money market. These exchange banks do not care to receive deposits from the public, as this would damage their credit. They employ agents who are always about the business quarter inquiring into the proceedings of their customers, so as to gauge their credit. When they want money they sell their bills on other places. They are often intrusted with money by officials, sometimes Government, but usually private funds, and on this they give, more or less as a favor, 5 to 6 per cent per annum. They do not lend money on land or houses, but they lend to local banks that advance it in trade on personal security. There are no bank notes in circulation at Chung King. When the merchants in the foreign import trade get in their debt, as on the three settling days, they buy bank drafts on Shanghai. They send around to two or three banks with which the firm in question does business and inquire their rate. No exchange brokers are employed. When a retail shopkeeper has gathered enough cash he buys a

The most curious feature in this system of banking is that there are no advances against goods, but only on personal security. The only instance of an advance against goods I heard of in Szechuan was at Chiating Fu, where an owner sometimes places insect wax in the house of a man who advances against it. But this is a clumsy transaction, only applicable to goods of fixed quality and of high value.

clumsy transaction, only applicable to goods of fixed quality and of high value.

There are exchange banks at a very few of the largest places only; in Szechuan, nowhere except at Chung King, Chengtu, and Wau Hsien. This accounts for the long journeys men make with goods. Thus, a merchant at Fung-ch'uan Fu told me he was in the habit of taking raw silk down to Chung King for sale, and bringing back

Lancashire cottons bought with the proceeds.

The division of the business of banking between exchange banks and local banks (cash shops) is much as follows: The former sell drafts on distant places, and pay those of their other branches, put out silver at interest on personal security, do some financial business for the Government, but not much, to meet payments due to Pekin, for instance, but for short periods, and take deposits, but not from the public generally, but rather as a favor. The local banks in some places issue paper money, but not in Chung King, borrow money from the exchange banks and lend it to the smaller traders and shopkeepers, and change cash for silver, and vice versa. The cancellation of indebtedness, one of the great functions of banking in Europe, is not undertaken by either class of banks. There are no current accounts and no checks.

## TAXATION AT CHUNG KING.

Foreign imports come into the city without any likin payment at present; this is due to the firm pied à terre we have within the walls, where Her Majesty's consular officers have been residing since 1877. There is every reason to believe that could the Chinese get us out, as they are very anxious to do, they would put an entry likin on our goods. On export upcountry there is a small likin on everything, e. g., 25 cash a piece on gray shirtings, say 1 per cent ad valorem.

cash a piece on gray shirtings, say 1 per cent ad valorem.

There is a likin of 1 per cent ad valorem on all exports to foreign countries, and the deputy who collects this lives at the office of the imperial maritime customs, where the tariff duty is paid, and merely follows their lead, so that this 1 per cent is simply an addition to the treaty tariff export duty. If 1 per cent is allowed now, it will

certainly soon be 5 per cent.

#### TRADE GUILDS.

Eight of the other provinces are represented in Chung King by guilds or clubs, each club consisting of the natives of a particular province. Their committees elect headmen, who represent in a way the whole body of merchants engaged in the interprovincial trade of the place, and who are consulted by the officials before any new move is taken affecting the commerce of the port. It is difficult to give a short and clear account of these guilds. From one point of view, they are simply clubs of coprovincials for mutual support; but then they have a religious side, the guild houses having a main shrine to the god generally worshipped in the province in question, and many smaller shrines to gods or departed heroes of particular places.

The guild houses are much the finest buildings in this country. Here the Chinese express their idea of magnificence. We visited the guild house of Hu-Kwang, i. e., Hupeh and Hunan provinces. The main part of the inclosure consisted of a broad, open space well flagged with stone between a temple and a theatrical stage. The atricals and religion are very closely allied in China. Behind the temple were committee rooms, and there are in the same inclosure the temples and halls peculiarly belonging to certain prefectures, e. g., Huang-chau Fu, the great cotton district close to Hankau, in the precincts of which the Kung-so, or association of raw cotton importers, holds its meetings.

The Kung-so are trade associations pure and simple, of men in any particular trade or employment, for common action in the interests of their trade. These associations are sometimes closely connected with some provincial guild, but not always, e. g., the Foreign Piece-goods and Yarn Kung-so, which meets in an independent temple.

Every trade and employment is regulated by such an association, which through elected officers attempts to prescribe minimum wages, and makes trade rules generally, imposing fines for the breach thereof, the sanction being ejectment from the association, and consequent ruin. In this direction, the Chinese mercantile class has worked out for itself a creditable organization, a representative system of a sort which, carried into the field of politics, might make the future of the Chinese people more hopeful. In Chung King, the only people not thus affiliated are the trackers and the water carriers—the residuum.

#### EXPORTS.

In consequence chiefly of her enormous export of opium, Szechuan could probably in years of good harvest pay for another £500,000 worth of foreign imports without feeling it much, provided our merchants offered her what she wanted to buy. Still, here as everywhere in China, to find exports is the best way to help the import trade. The Chinese are far from being miserly. They will spend on our goods all they can afford; but they have no more gold or silver to spare for export, and are reduced to paying in exported goods for every penny of import, and more, for they have now to provide interest and sinking fund on a very respectable debt. And the Szechuan exports might be greatly developed.

#### SILK.

The best silk in the province comes from the Jên-Shon district (latitude 30°, longitude 104° 20′). Little or none of this goes abroad, but to Chingtn, to be made into satin. Chia-ting Fu produces the best white silk. Little or none is exported. Mienchow (latitude 31° 28′, longitude 104° 53′) and Hsi-Ch'ung (latitude 31° 2′, longitude 105° 52′) supply the silk sent to Shanghai for Europe.

The wild silk exported from Chung King comes from Kuei-chou or from the Ch'ichiang district (latitude 28° 56′, longitude 106° 49′) on the southern border of the province. The industry is said to have been introduced here by a former magistrate.

The wild silk exported from Chung King comes from Kuei-chou or from the Ch'i-chiang district (latitude 28° 56', longitude 106° 49') on the southern border of the province. The industry is said to have been introduced here by a former magistrate who happened to be a native of Honan, where, and in the neighboring province of Shantung, is the original seat of the wild silk industry. He noticed the abundance of the species of oak on which the wild worm feeds, and sent home for eggs. The worms bred in the Ch'i-chiang region become so deteriorated in three generations as to be useless, and the stock has to be kept up by importation of eggs from Honan. This country has been much cleared of wood in recent years, and the Ch'i-chiang production is probably on the decrease, but the export from Kuei-chou might be greatly developed if there is a market for this silk in Europe.

# INSECT WAX, ETC.

Insect wax is exported now to some extent, and the supply from Szechman, Kueichou, and Yunnan is capable of indefinite extension.

Wool, bristles, hides, furs, and feathers can be had in any quantity. Their value

and the profits on their export might be greatly increased by works in Chung King to clean and pack them by machinery and by cheap labor.

GEO. F. SMITHERS, Consul.

CHUNG KING, August 15, 1898.

## FIRST SUPPLEMENTARY REPORT.

Various prices.

I have given above a statement of the imports to and exports from this port for the quarter ended June 30, 1898, as tabulated in the returns of the Imperial Maritime Customs. As I have pointed out before, these returns are incomplete, since they do not embrace goods arriving and departing from here in boats without customs charter certificates, which escape all notice by the foreign customs. These latter come under the likin office or provincial customs, from whom it is impossible to obtain any reliable statistics. Besides, goods arrive here under transit pass from Hankau, which are also not included. A large quantity of kerosene oil comes up in this manner.

The question as to how, where, and through what channels a market may be opened for American products and manufactures, presents many difficulties. There are doubtless many products of our country that the people of this section would readily purchase, if they had the money to do so. The natural resources of the country, it must be remembered, are almost undeveloped. Coal is mined in a crude fashion, but of tin and copper, of which there is doubtless an abundant supply, there is none taken out. At present, the condition of the masses is not that of abject poverty, but it is not such as to enable them to provide themselves to a great extent with articles of American manufacture.

The population of the province, which is in area about the size of France, is estimated at 70,000,000, but this is mere guesswork. I should be inclined to place it at between 40,000,000 and 50,000,000, which is likewise a guess. Not a single railroad has been built. There are many obstacles to trade, and this, in my opinion, is a great one. Shanghai has been rightly termed the New York of the East. Until proper communication is established with the coast, and foreign merchants find it profitable to locate themselves in this city for trade purposes, I do not look for any change in the present state of affairs, which is very gloomy so far as the introduction of any additional quantity of our products and manufactures is concerned.

The plant for the silver and copper mint at Chengtu, which is now in operation, was obtained in America, and was set up by an American who came out especially for this purpose. There may be openings for American mining machinery should the province enter on a scheme of extensive mining operations, which I shall not fail to report.

GEO. F. SMITHERS, Consul.

CHUNG KING, October 14, 1898.

### SECOND SUPPLEMENTARY REPORT.

I inclose a statement of the imports to and exports from this port, as given in the returns of the Imperial Maritime Customs, as well as the market values of the articles, as near as can be ascertained, for the quarter ended September 30, 1898.

### SHIPPING.

Number, capacity, and movements of vessels entered and cleared at Ichang during the quarter.

GEO. F. SMITHERS, Consul.

CHUNG KING, December 20, 1898.

### HOW TO PROMOTE TRADE IN CHINA.

[Extract from a report on the state of trade at the treaty ports of China, by Mr. Brenan, of the British consular service in China. Transmitted by Consul Smithers, of Chung King, under date of January 28, 1899.]

To ask what steps can be taken to promote British (and American) trade in China is almost the same thing as asking what steps can be taken to improve the condition of the people, for China's capacity for buying progresses with the development of her material resources, and this development is at present struggling against every obstacle that bad government can put in the way. The measures which we can of ourselves take to effect an improvement are confined within narrow limits, and I can but indicate certain directions in which something may be done with the prospect of beneficial results.

The absolute poverty, amounting to destitution, of the bulk of the Chinese population reduces to less imposing figures the numbers of those whose needs it is the aspiration of foreign manufacturers to supply, and the improvement of the condition of the semistarving millions must be worked out independently of any efforts of

ours.

But without venturing beyond legitimate limits there still remains something to be done. We have obtained a footing in China, but we move forward very slowly; and we are too tolerant of the "vis inertia" which Chinese officialdom ever opposes to us when we try to advance in any direction. We fail to perceive that the perversity of the Chinese Government in continuing in its suicidal methods is due to the utter selfishness and corruption of the ruling classes. We too readily assume that a spirit of conservatism, ignorance of the first principles of political economy, and a policy of China for the Chinese are the true explanation of China's arrested development; and we console ourselves with the reflection that enlightenment will bring about a change. We devote our efforts to imparting that elementary knowledge which once absorbed and assimilated will, we hope, work a change in the minds of China's rulers and, through them, of China's millions. Meantime all progress is arrested, and in our tolerant mood we allow our grievances to go unredressed, and we fail to turn to account the opportunities placed in our way by the commission of Chinese official misdeeds.

I have more than once alluded to the antagonism existing between the provinces and the Central Government in matters of revenue. In accepting the obligations put upon it by the treaty, the Chinese Government undertook, if not more than it could perform, certainly more than it is disposed to carry out. Disputes arising out of commercial questions necessarily have their origin in the provinces, and the attempt to settle them has in the first instance to be made there. The willingness of the provincial government to make redress for any injury done to British interests in the province is dependent on the local official's appreciation of the gravity of the situation. If in declining to make any restitution he sees nothing worse ahead of him than a reference to the higher authorities at Pekin, his mind is at ease, for Pekin will always take the side of the province, and will be most reluctant to disavow any action there taken. Even if unusual pressure is put on the Central Government, and it can be brought to admit that the claim is just, matters are not necessarily much advanced, for the Chinese Government's orders are not always carried out in the provinces, even when earnestly meant, and much the less so when it is understood that they have been reluctantly given.

it is understood that they have been reluctantly given.

The British minister's most urgent expostulations may, indeed, result in orders from Pekin being sent to a provincial governor. These are passed on to the authority at the port, but by the time they have reached their destination the momentum of the pressure is lost, with the result that the orders are obeyed in a purely formal way, with as bad grace as possible; but, meanwhile, the time for repairing the mischief has probably gone by, and the net result is that we are virtually defeated.

To give one specific case out of many such: A British merchant at a treaty port

To give one specific case out of many such: A British merchant at a treaty port appoints a Chinese agent to sell coal for him. Some local revenue officer directs the Chinese agent to add 5 per cent to the price and to pay the money to his department. The Chinaman, under instructions from his employers, refuses, and he is seized and imprisoned. The usual reference to Pekin is made, and orders in due time arrive, but meantime the business has been injured and all Chinese concerned intimidated. The net result is that the purchasers are still surcharged the 5 per cent, and that the Chinese agent holds his tongue in future.

When the minister of a foreign power in Pekin has to make representations to the Chinese Government, he addresses himself to the Tsungli Yamen, or board of foreign affairs. This board has no direct authority over provincial governors; it can but address a communication suggesting or recommending that such and such a course be followed; but it has happened to me more than once, when pressing a provincial viceroy to carry out the instructions which the British minister had been

assured by the board of foreign affairs had been sent, that the Vicercy has replied that he was responsible for the government of the province, and that the board

could not give him instructions.

In important matters, such as the promulgation of a new regulation, or the removal of a culpable official, the board of foreign affairs would apply for an Imperial decree, which would insure immediate compliance; but for everyday matters the board's communications to provincial governors take the form which official usage prescribes, and are by no means in the nature of an imperative command.

The financial difficulties which now beset China may turn out to be more productive of reform than the severe lesson lately forced upon the country by Japan. If China's need of money is wisely utilized by foreign powers she may be driven to husband her resources and to adopt measures for still further adding to the national wealth.

From this time forward China will have to meet an extra call of something like 15,000,000 taels a year to pay the interest and sinking fund of her recent loans. This, to a State whose national budget is estimated at about 100,000,000 taels, is a serious matter, and imperatively calls for a reconsideration of her financial position. China's first thought is naturally of the foreign maritime customs as the only portion of machinery in her complex political system that is in good working order and can be trusted to increase the production at a moment's notice. To double the foreign customs tariff is to nearly double the customs revenue; to double the native customs duties or the likin tariff would probably mean no increase at all in the amounts remitted to the treasury. The foreign maritime customs is the willing horse that must be worked to death. If the likin collection and not the maritime customs had been intrusted to foreigners it would have been to the former that the Chinese Government would have looked for aid in the time of need.

If China can now obtain the unconditional consent of foreign powers to increase the tariff the Government will be relieved of its embarrassment without an effort, and no attempt will be made to introduce any sort of order or honesty in the provincial financial system. It is only under the stress of necessity that the central government can be expected to nerve itself to tackle such an uncongenial task.

China comes to the foreign powers with the proposal that the treaty tariff should be doubled. Taking the revenue of 1895 as a basis the duties on foreign imports, exclusive of opium, amounted to 3,781,000 taels. Assuming that the increased duties would not restrict the trade, China can, at most, count on getting 4,000,000 taels additional. If the export duties are to be increased it can not fail to affect the trade, and a doubled revenue can not be expected. In 1895, the duties on exports to foreign countries amounted to 5,940,000 taels. To assume that an increase in the export duties would add 3,000,000 taels to the revenue is perhaps too sanguine.

At most, then, China might get 7,000,000 taels more than at present. Probably in not more than three or four of her best provinces, the money now collected under the

name of likin, and embezzled by officeholders, amounts to this sum.

It is for foreign powers to name the terms on which they are willing to grant China's request. From these powers, who only desire to look upon China as a country possessing enormous latent wealth awaiting development for the benefit of mankind, the terms which self-interest suggest are also those that will prove a source of profit to China herself.

If the Chinese Government is sincere and is not merely striving to obtain what, with its confused ideas of economic questions, may well appear to it to be a cheap advantage over foreign nations, we may fairly require it to give evidence of good faith by showing itself willing to entertain proposals designed to attain the ends it professes to have in view; and if, after we have indicated a course which will not only enrich the State but bring prosperity to the people, the Chinese Government still persists in preferring measures which must be injurious to the nation at large, we may well refuse to be a party to the suicidal act and withhold our consent to any modification of the treaty.

To what extent the domestic trade is strangled we can only surmise. Foreign merchants are not interested in interprovincial commerce, and we have therefore but little information on the subject. Along the coast domestic trade has some chance of subsisting, for fortunately likin stations can not be established in midocean, and seagoing craft can only be taxed at the start and finish; but when commerce has to follow inland routes it is soon taxed out of existence. It would be an interesting experiment for someone to start in any direction with a quantity of merchandise, selling, as it became necessary, a portion to pay the taxes imposed en route. Like water poured on sandy soil, it would all be absorbed before going far.

To what extent purely domestic trade is taxed may be inferred from the follow-

To what extent purely domestic trade is taxed may be inferred from the following: Under the transit pass rules, foreigners, but foreigners only, may buy produce in the interior for expertation to a foreign country, and pay one transit duty

in commutation of all inland taxes. This transit duty is 21 per cent ad valorem. As the inland taxes are much heavier than this, Chinese traders, in collusion with foreigners, hit upon the idea of escaping the crushing inland taxation by bringing produce from the interior to a port under a transit pass, as if it were intended for exportation; having reached the port, the produce, which had only paid 21 per cent, exportation; having rescued and pots, the product of the sold locally and not be exported at all. Or again, foreigners would obtain transit passes, bring down produce from the interior to the treaty port, and there ship it to another treaty port for sale there. This was using transit passes for a purship it to another treaty port for sale there. pose which the treaty did not contemplate.

To check such malpractices, the precaution is now taken at Chinkiang of requiring the merchant to deposit a certain sum at the time that he applies for his transit pass. The amount is equal to six times the transit duty—that is, 15 per cent of the value of the goods. If, in course of time, the merchandise is duly exported to a foreign country, one transit duty is retained and the balance is returned to the merchant. If the produce is sold locally, or is sent to another port, then the whole amount is retained. This mode of bringing produce from the interior to the port is now considered legitimate, and foreign merchants are relieved of the stigma of applying for transit passes on false pretenses. A considerable amount of trade in native produce is done in this way, and the fact that these pseudo transit passes are in demand proves that the inland taxes from the interior to Chinkiang must mount up to more than 15 per cent.

This gives some idea of the burden of taxation which domestic trade has to bear. The result must be that the surplus of one district can not stand transportation to a distant market, and production is thus discouraged. Districts within certain limits must in a great measure be self-supporting, each producing sufficient for its wants and no more. The channels through which remote districts can most freely exchange each others' products are those that exist between the treaty ports; and this relief to domestic trade is an indirect result of our treaties with China.

If the Chinese Government needs money, the way to obtain it is clear. Restore to life the domestic trade now in a state of suspended animation, and nurture with care the goose that lays the golden eggs. This is not the place to elaborate a scheme for increasing the revenue of China, but her good faith may be put to the proof by offering to her an arrangement something like the following: China's revenue from foreign trade is known exactly, and the revenue from likin and other forms of inland taxation may be roughly estimated. Foreign powers will consent to double the import tariff and revise the export duties on condition that the number, position, and tariff of the likin extense shall be a matter of international arrangement and and tariff of the likin stations shall be a matter of international arrangement, and that the present likin collectorate shall be replaced by a foreign administration on the model of the foreign maritime customs; that the likin taxes shall be paid to an agent of the provincial government, as the maritime duties are now paid to a Chinese agent of the Imperial Government, the function of the foreign staff being, as in the imperial maritime customs, confined to examining merchandise, checking the duties, and protecting the revenue. As a basis serving for future adjustment, the revenue from import duties would be taken at double the present collection, and the revenue from likin, at whatever estimate, could be arrived at. In the future, as trade revived and the revenue improved, a gradual reduction in the import tariff and the likin tariff would be made until that tariff was arrived at that yielded the largest amount of revenue, when it would remain fixed.

As long as provincial governments retain the power of opening new tax stations and placing them in the hands of corrupt officials our goods will never be safe. Whatever promises the Chinese Government may now make, there is no reason for believing that it has the will or the power to abide by its new engagements more faithfully than by the old. Any talk about refunding illegal imports is vain; before restitution can be demanded there must be proof, and proof will never be forthcoming, for no Chinese will venture to bear witness against his own officials.

It is the uncertainty as well as the burden of taxation that acts in restriction of trade. Chinese merchants complain that they are unable to base any estimate on the published tariffs of the likin stations, for these are enforced in a very loose way. Two merchants in the same line of business may fare very differently, and the less favored may find that his venture results in a loss.

There is one step which Her Majesty's Government can take in furtherance of trade. There appears to be wanting a link between the consular service and our merchants and manufacturers, which could be supplied by the appointment in China of an officer who could devote his sole attention to the development of trade.

### PROVINCE OF YUNNAN.

Consul Smithers sends from Chung King, Oct. 18, 1898, extracts from a report on the province of Yunnan, by Mr. Bourne, of the British consular service in China, as follows:

Imports into Yunnan pay likin as follows:

Article.	Amount of likin.	Percentage ad valorem, approximately.

The import of foreign cottons into northern Yunnan is small, and it may well be doubted, in view of the nature of the country, whether there is much possibility of increase under present conditions, but 60,000 to 70,000 bales (say, 4,700,000 pounds) of native cotton cloth pass this barrier per annum, and the whole import into north Yunnan from Sui Fu and Lu Chow may be estimated at 80,000 bales (say, 3,200,000 pieces).

The chief export is Yunnan opium, on which the likin is 72 tael cents per 100 Chinese ounces (133 ounces avoirdupois). Yunnan opium goes north by this road to the extent of 10,000 boxes, or 10,000,000 Chinese ounces per annum.

The likin tariff is here more strictly enforced than is usual, but still merchants in a large way get off more cheaply than small traders; thus during the first and second months in the year, a discount of 18 per cent is allowed, and rich merchants then push through their goods. The likin officials here, as everywhere, are extortionate and unreasonable with the small distributer, demanding payment in cash or silver, as they choose, at exorbitant rates of exchange. When we passed, they were demanding cash at the rate of 1,600, while they only paid out 1,350 per tael. In one respect, the likin collectorate in the Yunnan and Kuei Chou provinces compare very favorably with that of any part of China. One payment frees goods of likin throughout the province. The Lao wa t'an station is assessed at 140,000 taels per annum, but it only collects at present some 60,000 taels, or rather that is all that reaches the provincial exchequer.

From the outside, as one ascends the river gorge between high mountains, Lao wa t'an appears an ideal mountain village; the shadow of the deep gorge, the roaring torrent, the light chain flying bridge imbue the place with a glamour of the picturesque; but from the inside, Lao wa t'an is as bad a hotbed of filth and slovenly confusion as can well be imagined. So far, goods to and from Sui Fu are conveyed by pei-tzŭ, i. e., porters, who carry their loads on the back upon a framework strapped behind the shoulders. They are wretched-looking objects, carrying each 150 to 200 pounds 10 to 15 miles a day, picking their way, step by step, along these awful mountain roads with a miserably dejected look. The cruel weight seems to oppress their breathing. At Lao wa t'an, the goods brought by pei-tzu are repacked and sent on by caravans of mules and ponies.

The road between Sui Fu and Lao wa t'an is in many places inconceivably bad, as if cart loads of limestone blocks had been emptied thereon, but it has no very violent gradients, following the river valleys for the most part. Here we passed pei-tzu in great numbers, carrying native cotton cloth, foreign cottons, tobacco, sait, and drugs into Yunnan, and bringing out opium, tin, copper, tea, and drugs. Before Lao wat'an is reached, the red sandstone of Szechnan has entirely disappeared and been

replaced by limestone, blue and gray, and the flora is very different; the bastard ban-

yan, so distinctive a feature in Szechuan landscape, is seen no more.

Lao wa t'an passed, the ascent of the Yunnan plateau begins; the road, once a good highway paved with stone, is now often for hundreds of yards together no better than the bowlder bed of a mountain torrent. However, this is the one great commercial route between northern Yunnan on the one hand, and Szechuan and the eastern provinces on the other. And there is a large transit trade; we pass many hundreds of animals every day in big caravans, chiefly of country-bred ponies.

On the plateau, the country looks bare and dry, like North China, and there is no

winter crop, as in Szechuan.

The prefecture of Chao t'ung is miserably poor. The soil is a dry loam. The country is 7,000 feet above sea level, and dreadfully swept by the wind. Sun and wind prevail from November to June, and July to October there is too much rain. The district lies midway between the two sources of cotton supply, Hankau and Burma, so that cotton is dear and the people ill-clad, many children being quite naked (March) when we were wearing English winter clothes.

There is practically no market here for Lancashire cottons, the people being too

poor to afford them.

Tung-ch'uan Fu is on the border of the district supplied with foreign imports from the Yangtze on the north, and from the Ton King and West River routes on the south, goods coming from both directions. The local dealers supply themselves with for-

eign goods by buying from itinerant merchants.

Copper is still mined on a considerable scale at four places within 50 miles of Tung-ch'uan. No tin has been found in the prefecture, but there is lead, zinc, and silver, besides coal and iron. Gold is found at Hui-li Chau, but none here. Mining in this prefecture, particularly of copper, was once a great source of profit to the Government, but, like everything else in China, it has fallen into decay.

The imperial commissioner for mines in Yunnan is said to be a particularly honest official, but he is very badly served by his subordinates, who do not spend the money he sends for development upon the mines, which are said to be going from bad to worse. Some years ago, he employed Japanese mining engineers, but they failed to improve matters and were sent back. They told us that the imperial commissioner is about 1,000,000 taels to the bad in his account with the Pekin Government. do better they want honest men and money, but neither are forthcoming. The Chinesse fail here for the reason I have before pointed out—incapacity to cooperate in large enterprises, and this again depends on radical moral deficiencies that can by no means be made good in a day. The price of copper in Tung-ch'uan was 13.6 taels per picul (say, £35 per ton).

Freight by pack animal from Chao-t'ung Fu to Tung-ch'uan Fu, 107 miles, on two bales of Shasi cotton cloth, weighing 110 catties, is half a tael, say 2½ d. per ton per mile.

ton per mile. Copper from Tung-ch'uan pays 18 tael cents per stage of 30 miles per pony-load of 150 catties (200 pounds avoirdupois), say 2.4 d. per ton per mile. On a well-ordered caravan route like that between Meng-tzu and Yunnan, the rate tends to be less, but for the whole of the province, 21 d. per ton per mile may be taken as

fair rate.

The walls of the city of Yunnan Fu are not more than 3 miles in circuit; the place has, including the suburbs, a population of about 100,000. The plain in which the city stands measures about 55 miles north and south by 15 miles east and west, the lake occupying the greater part of this area. The lake has an outlet to the Yangtze by Ngan-ning Chau, but not large enough to carry off the rains of July and August, when the plain is fleeded for miles for to the carry off the rains of July and August, when the plain is flooded for miles far to the east of the city.

There is regular boat traffic by night upon the lake, but none by day, because of the violence of squalls. About a mile from its north end the lake has a natural breakwater running almost from side to side. The water in the space inclosed is

shallow and very clear.

For man the climate is delightful—never very hot or cold—but not for vegetation. The sun shines almost without a break from November to June, while from July to

October the country is deluged with rain.

No cotton is grown in the province, which has to import its whole supply, and a large trade this must be, for little else is worn. North Yunnan is supplied with raw cotton from the Lower Yangtze via Sui Fu, west and central Yunnan from Burma, and the southwest of the province from the Shan States. I heard on good authority that before the rebellion (1856-73), 200,000 bales of Burmese raw cotton had been import 1 into Yunnan Fu annually. The import now is about 10,000 bales.

The day will no doubt come when we shall spin coarse yarns in Burma from Shan

States cotton and export it for use upon the plateau, where population might increase very rapidly if capital were introduced, the mines worked, and immigration from

Szechuan encouraged.

Foreign yarn comes for the most part from Kongkong via Ton King and Meng-tzu under transit pass from the latter place, thus escaping all likin and fu-shui, although some comes from Burma by the Ta-li Fu route.

Mr. Bell noticed in a shop some 40's yarn—no doubt Lancashire—that had come that way. One bale of yarn is split into 4 bales and 40 catties over, in Hongkong, each smaller bale containing 9 bundles, or 90 pounds. A pony will carry two such bales. Local weaving from this imported yarn is greatly on the increase. In Yunnan Fu itself there is about an equal consumption of Shasi cloth and of the cloth woven locally from foreign yarn. We noticed a placard issued by a benevolent institution (Ti-jen T'ang) exhorting women and girls to learn the art of weaving foreign yarn, quoting Confucian scripture freely to prove it was their duty; moreover showing by arithmetic that it was profitable, and finally offering to teach gratis all women and girls who would learn. The society had engaged women instructors and suitable accommodation in six different parts of the city, where all who wished could learn. This is being done by the leading men of the place, and is perfectly bona fide. The same movement is going on all over China and will continue until the Chinese are rich enough to buy better cloth, or until the weaving of strong coarse loosely-knit cloth can be done cheaply by machinery. The profits of weaving accrue locally, and the imports of foreign yarn no doubt make larger profits, the trade being new, than those of Shasi cloth, an old established trade, in which competition is very keen.

This trade is a small one, comparing this place with cities of equal size in Szechuan, because the proportion of well-to-do people is less. The cloth they do buy was pronounced by Mr. Bell to be of lighter weight and inferior quality to that sold in Szechuan, although the climate here must be colder. There is no sale for a cloth like Calvert's C C C. The merchants here recognized the merits of such cloth, but said the people could not afford it—they would buy it if they could. Generally, the better descriptions of goods—figured lastings, black italians, and the better class of prints—were scarcely seen at all. As I said in a former report, next to the people themselves, no one would benefit so much from the development of the riches of this country as English manufacturers and operatives. Still, the market at Yunnan Fu is well supplied with Lancashire cottons; all the people can pay for they

get readily enough.

There are great possibilities of expansion of trade in western and southwestern Yunnan, but eastern Yunnan, where we have been traveling for the last six weeks, is a poor country, consisting for the most part of dry wind-swept downs, on which nothing is grown, except, perhaps, one crop of Indian corn a year. The irrigated valleys and lake basins alone are fertile and capable of high cultivation, and they occupy a relatively small area. This applies to the whole province. Population is very sparse and might be easily increased five and, perhaps, ten fold by immigration from Szechuan, which is overcrowded. Nearly all the towns and villages are in ruins. The native Yunnanese are, generally speaking, too much addicted to opium, lazy, and apathetic. They raise easily in their valleys sufficient rice in summer, and in winter they grow opium, with which they pay for cottons to wear. At present, the part of the province east and northeast of Yunnan Fu can scarcely afford to buy any of our goods, excepting cotton yarn. Poor as they are, they must have clothes, and to buy coarse imported yarn and weave it at home they find the cheapest way of providing a covering from the wind. They prefer Shasi nankeen. They greatly prefer Lancashire cloth, but they can afford neither. The only hope for our cottons in eastern Yunnan lies in the mining and in the better means of communication that mining would bring about.

Likin is not so oppressive as in Kwang-Tung and Kwang-Si, because one payment frees goods over the whole province; but fu-shui, or prefectural duty, takes its

place, and is a great incubus on trade.

There is no water carriage worth mentioning within the borders of this huge province, which is a vast table-land scored by mountain ranges and eroded by water into deep canyons. Goods are conveyed by caravans of ponies, carriage costing 2d. to 3d. per ton per mile. There is a great dearth of capital. Fixed capital was destroyed almost entirely in the rebellion, and is only replaced out of savings, a very slow process where communications are so bad. There is no western merchant established within the borders of the province.

If Yunnan be left to progress à la Chinoise, it may well take one hundred years to

reach the condition of Szechuan. If the pace is to be hurried, the first step should be the establishment of a caravan trade under transit pass from Burma, as now exists from Tonkin. The same might be done from Wu Chau by way of Nanning and Po-Se, and perhaps from Chung King by way of Sui Fu. All this we can claim under the treaties. But no great development of trade is likely to come about until foreign skill and capital are employed in mining. The opening of mines would bring improved means of communication, immigration from Szechuan, and good

bring improved means of communication, immigration from Szechuan, and good wages. A demand for our goods would certainly follow. At present, the capacity of the province to take our goods is limited by the value of opium and tin she can export.

### CHENGTU PLAIN AND ITS IRRIGATION.

Consul Smithers, of Chung King, sends under date of November 18, 1898, the following abstract from a report by Mr. G. J. L. Litton, of the British consular service in China:

The extraordinary fertility and dense population of the Chengtu plain have attracted the notice of all travelers. The perfectly flat country around the capital is divided from the basin of the Fou River on the east by a ridge 55 miles from Chengtu by the Pekin road (Pai Ma Kuan). Where the high road crosses it the ridge is only 200 feet above the plain, but farther south it becomes a considerable range

The Fou basin is on a lower level than Chengtu, and the city of Mien Chou (which is north of Chengtu and therefore nearer to the head of the watershed) is 200 feet below Chengtu. The Chengtu plain again rises gradually towards its north and northwest extremities. The city of Kuan Hsien, 40 miles northwest of Chengtu, is 700 feet above it, though the rise is so gradual as to be quite imperceptible without observing the flow of the waters and the barometer.

To the south and southeast, a journey of 30 miles brings us off the plainin to the low-hill country around Chien Chou. In the southwest corner the plain dips down to Chiang K'ou (200 feet below Chengtu), a mart where all the various branches of the Min River come together into one stream. On the west the plain is bounded by the hills as far as Kuan Hsien, whence the mountains trend to the northeast, passing beyond the large city of Mien Chu Helen, which may be termed the north gate of the plain, the whole including an area of about 2,500 square miles. Besides Chengtu, with its estimated population of 400,000, there are no less than fifteen distinct cities in the plain, of which at least two (Han Chou and Mien Chou), contain at least 40,000 inhabitants each. Besides these, there are flourishing marts at intervals of 4 or 5 miles along the numerous roads which intersect the plain, two of which (Chiang K'ou, at the southern exit of the plain, and Chao Chia Tu, at the head waters

of the Lu River) are reckoned among the principal commercial centers of this province.

Water communication with the Yangtze is somewhat defective, except from Chiang
K'ou, but boats go down from Kuan Hsien in high water and from Chao Chia Tu and
Chengtu. The port of Chengtu is outside the east gate, and small "wu-pan" boats,
with a capacity of 10,000 to 20,000 catties, are far the most common. Small kuateu, or house boats, carrying passengers, but not as a rule freight, are also seen.

Freight averages 9 cash (1½ cents) a catty between Chung King and Chengtu, whereas by land it is as much as 50 cash (7 cents). The landing place at Chengtu is along a canal about 25 yards broad, where (early in November) I counted about 100 wu-pan and 15 larger house boats. Two miles below the landing place the river emerges from the suburbs and passes under a fine 9-arch bridge. From this point, the river broadens to 60 wards but the river control of the river broadens to 60 wards but the river but the river but the river broadens to 60 wards but the river but the rive the river broadens to 60 yards, but there are numerous shallow places, and at low water boats have to content themselves with half cargoes.

The most striking feature of the landscape is the extraordinary number of well-built farm houses, each surrounded with its vegetable garden, fruit trees, and grove of bamboos, giving an air of prosperity almost unique in China. Viewed from the hills above Kuan Hsien, the country looks like a great forest of fruit trees. Much of the land is owned by religious and other corporations in Chengtu, but it is all cut up into very small farms. The chief products of the plain are:

Silk, near Chengtu and to the southwest at Chiang K'ou.
 Tobacco, from Pi Hsien, Chin Tang, etc. (a very large production).

 Sugar, from Han Chou and Te Yang.
 Rape seed oil, from Kuan Hsien and the northwest. 5. Paper, indigo, and fine flour, from Mien Chu Hsien.

6. Most important of all, large supplies of rice, from Chin T'ang, Peng Hsien, Kuan Hsien, and the northwest of the plains.

The whole of this great and rich population depends for its existence on irrigation works, without which the east and west of the plain would be a marsh and the north a waterless desert. The eastern part of the plain is watered by numerous streams, of which the most important are the Los and the Mien Yang rivers, which, with their tributaries, descend from the hills around An Hsien, and, flowing through the country between Lo Chiang and Hsien Tu, join together at Chin Tang to form the Lo Shin, otherwise known as the To River, which debouches into the Yangtze River at Lu-Chou.

During the summer, the rush of water down these streams is great, as is proved by the large shingle and sand banks formed in places where the bunds have given way. Between Han Chou and Chengtu, a distance of 30 miles, no less than 14 bridges are crossed, and I gather that some of the streams which they span are artificial, but

they are all banked up, in some places with earth dikes and in others with stones plastered together or packed in bamboo baskets, to such an extent that it is impossible to say which are natural and which are artificial channels. The principle has evidently been to break the force of the water by providing it with as many channels as possible. Besides these main channels there is a great network of deep cross ditches, averaging 5 yards in breadth, by which water is conducted to every field that requires it. At frequent intervals water gates with low dams are erected, by which the water when it falls to a certain level shuts itself off.

The works at Kuan Heien, on the western border of the plain, 120 li (48 miles) from the west gate of Chengtu, deserve for their ingenuity, simplicity, and utility to be ranked among the first public works of China. A reliable tradition ascribes the commencement of the work to Li Ping, the first "t'ai shou," or hereditary governor, of Chengtu, who was appointed by the Ch'in after they had overthrown the aboriginal Kingdom of Shu, and the completion of the work to Li Ping's son.

The objects which the ancient engineer seems to have set before himself were to prevent an excessive rush of water down the west of the plain, and to irrigate the north and center of the plain by connecting the watersheds of the Min and Lu rivers by streams across the country.

The city of Kuan Hsein is situated at the point where the Min River issues from a magnificent gorge. The west bank of the river is fringed by high mountains, and the east bank is separated from the west wall of the city by a high bluff which runs

South the plain for about 200 yards beyond the city.

Southwest of the city, an artificial gorge about 100 feet deep has been cut through the solid rock.

Through this gorge a copious stream about 40 yards broad has been diverted eastward at right angles from the main stream of the river; the cliff has thus been left surrounded to the north and west by water, and the east and south by the plain. The plain dips down to the east and south, though this is not perceptible to the naked eye. Thus a part of the water of the main channel, foiled in its effort to go south, partly by the cliff and partly by the big dike built in the channel opposite and a little above the cliff, forms a whirlpool under it and then rushing along the gorge, runs like a mill race past the south gate of the city. Both sides of the chansouth gate, this stream is artificially divided into two channels, one of which flows across the plain to the south gate of Chengtu, and the other, navigable in summer for timber rafts, flows to the north gate and is connected with the one running to the south gate by the navigable stream which flows under the east wall of Chengtu. The highroad from Kuan Hsien to Chengtu thus passes between these two channels. Between Kuan Hsien and P'i Hsien (22 miles) these streams are connected by two

minor channels flowing from south to north across the highroad, but the bulk of the water that comes through the gorge is diverted past the east gate of the city, and away to the northeast, passing between the cities of Peng Hsien and Ch'ung Ning. each 20 miles from Kuan Hsien to the north-northeast and northeast, respectively. Flowing across the whole of the plain and irrigating it as it goes, this important channel joins the upper waters of the Lu River at the city of Hsien Tu, 12 miles to the northeast of Chengtu, thus connecting two distinct watersheds. The channels near Kuan Hsien are certainly artificial, but farther to the east advantage has probably been taken of natural water courses. I may add that the latest map of China

(Bretschneider) has these streams all wrong.

Li Ping bequeathed to posterity as the principle of regulating the waters the sentence, "Dig the channels deep and make the dikes low"—that is, keep the water at its natural level—a principle which, if it had been applied to the Yellow River, would

have saved untold misery and loss.

Just below the point where the Min issues from the mountains it sends off a subsidiary stream. Advantage is taken of this to construct a movable barrier upstream, consisting of a series of tripods, each made of three saplings, 15 feet high, lashed together at the tops and fixed in the bed of the river. These are then filled up with bamboo baskets full of large stones. The great dike above mentioned is of a similar This is thrown slantwise across the main stream at the mouth of the

gorge with the object of driving the water into the gorge.

In the month of November, when the water is sufficiently low, the Shin Li Fu, or prefect of the waterways, who is resident at Kuan Hsien and has direct control of the works, began to construct the western half of the barrier where the Min comes out of the mountains. This shuts off the water from the subsidiary channel, which is then dug out for a distance of three-fourths of a mile, the stonework pulled to pieces, and carefully restored. The west half of the barrier is then removed and the eastern half is constructed. This turns the water back into the subsidiary channel and shuts it off from the main channel, and in consequence from the gorge and its three channels. All these are then carefully dug out for a distance of about threefourths of a mile, and from 5 to 6 feet of gravel and sand, the accumulation of the year, is removed.

In the middle of the gorge are three iron pillars placed flat on the bottom of the stream. One is dated Hsien Feng, one is of the Ming dynasty, and one has now vanished altogether. The object of these pillars is to mark the proper level of the stream, and the workmen have to dig down to them and no farther. The great dike is then repaired, and the stone bunds along the various channels are entirely removed and replaced and made as strong as possible. Thus year after year for 2,000 years has Li Ping's motto been carried out.

By the month of March, when water is required for the paddy fields, all is ready, and the "deus ex machina," in the person of the taotal from Chengtu, appears upon the scene. He solemnly receives a present of 200 taels from the two magistrates of Chengtu for his expenses; then performs ceremonial devotions and orders the barrier to be removed. At this juncture his attendants are supposed to dash at the water and urge it forward with strokes of the bamboo. The Min, thus hastened in its course, rushes back into its main channel, and the gorge, with all its channels,

is at once filled.

The object of the great dike is to secure a sufficient supply of water through the gorge. If the water rises very high it flows over the barrier and down to the south. A gauge is cut in the rook in the middle of the gorge, and it can be seen at a glance if too much or too little water is coming in. The viceroy, Ting Pao Cheng, the predecessor of the notorious Liu, got into trouble by making the big dike too high when he repaired it, with the result that too much water came through the gorge and the plain was flooded.

# FUCHAU.

The year 1897 has not been a favorable one for the special product of this region, tea, and the usual falling off in amount must again be reported. The ordinary crop was much retarded by unusual rains, there being two hundred and thirty-three days of last year which were heavily overcast or in which rain fell.

The scarcity of rice, the chief food product of the people, caused great suffering, the price of this article being nearly double, and the price of

fuel also having largely increased.

The value of foreign imports fell from 5,259,000 taels (\$3,886,401) to 5,238,000 taels (\$3,870,882), and of domestic imports from 1,677,000 taels (\$1,239,303) to 1,629,000 taels (\$1,203,831). The exports of local products show a decrease from 7,860,000 taels (\$5,808,540) to 6,840,000 taels (\$5,054,760). The receipts at the custom-house fell off about 11 per cent. The business of the port has been sadly interfered with by low and uncertain exchange, which has caused a rise in the price of all imported goods and has led the merchant to do only a small business, as the peril in carrying large quantities of goods liable to a fall in the market by fluctuation in exchange was too great to warrant large investments.

At one time, there was a lively market in piece goods, when suddenly a drop of 12 per cent in the price of silver demoralized the market and merchants were unable to place orders.

The chief exports from this port are tea, lumber in poles, bamboo,

fruit, and paper, the latter being made of bamboo fiber.

#### TEA.

The export of tea for the year 1897 shows a falling off of nearly

16,000,000 pounds from the previous year.

There was an excellent demand for tea of superior quality, but the supply was very short, due doubtless to the very unfavorable weather during the spring months.

There is a marked improvement in the character of much of the tea now shipped from this port, owing to special effort being made to prevent mixing new tea with that on hand from a previous season, reducing the amount of dust, and to better firing by the natives.

The Fuchau Improvement Company, established some three years ago, has had to labor under great disadvantages, but is gradually overcoming the obstacles usual to a new enterprise. The company has a small plantation and works at Doon Ling, about 15 miles from this city. Its location among individual growers has supplied a market at the doors of the producers, and the people of the neighborhood, finding they could bring their product personally to the factory and thus avoid paying middlemen and likin taxes, have found it profitable to give more attention to the careful growth and picking of the leaf. pany has recently been reconstructed, and now has a working capital of over \$70,000.

The local government has shown a disposition to assist the growers and merchants in the improvement of this product, by reducing the likin taxes on tea en route to Fuchau. This has been received with great favor, and has encouraged all who are engaged in either raising or bringing tea to market. This action may not be entirely unselfish on the part of the local government, as it doubtless fears that tea would be brought down under the protection of transit passes; in which event, under recent regulations, the revenue would go to the central government, while the likin tax is collected by the local authorities. reduction is 4 mace (about 26 cents) on 100 catties (133 pounds).

At present, with the heavy likin and export duties, the growing of tea is scarcely remunerative in many districts. This region still holds the ascendency in Oolongs, Souchongs, and Flowery Pekoes, as nothing equal to these teas can be produced in India or Ceylon.

With the decrease in export and likin duties, and with more attention to the cultivation of the shrub and the picking of the leaf, this section might reasonably hope to see a great revival of this industry. Many Cantonese compradors and other wealthy Chinese are interesting themselves in tea improvement companies, and this should result in largely restoring trade in this important product. The foreign trade in tea is the chief dependence of the market, for it is estimated that the native population consumes on an average only about 3 pounds per head per annum, while in England and Australia, the average is 6 pounds per head for the entire population. Much of the tea consumed by Chinese is of very inferior quality, dust being used by the common people, and a vast number being unable to buy even that.

# COMMERCIAL TREATIES.

The Chinese Government has given notice of its intention to demand a revision of the commercial treaties, in accordance with Article XXVII of the treaty of Tientsin. In consequence of currency exchanges and other causes, the actual duty now collected under a 5 per cent standard does not exceed 31 to 4 per cent. In view of these facts, it is generally conceded that the Chinese are entitled to a revision of the scale fixed in 1858.

# COTTON GOODS.

In this section of China, the people generally are clothed all the year round in cotton goods, most of which is made on hand looms in the houses of the people. In regard to foreign cotton goods, Mr. Bourne, who was in charge of the so-called Blackburn Commercial Mission, which visited China two years ago, says:

In the staples of our (British) import trade, namely gray and white shirtings, there is no direct competition; that is, no other country is making the same class

Digitized by GOOGIC

of goods, but there is indirect competition, especially from Japanese figured fabrics and from Indian Japanese and Chinese yarn woven at home. These compete with shirtings by tending to displace them. In coarse cotton yarn, Lancashire is out of the market, beaten by India, Japan, and China. In drills and sheetings, used in the colder provinces north of the Yangtze, we have a most redoubtable competitor in the United States.

We can only compete with Japan in her specialties by the adoption of far eastern designs and by constant change of patterns. A study by good designers of the collection brought home by the mission of the best patterns in silk brocades, which are said to be the traditional basis of all native textile designs, may throw light on this question. The imports of Lancashire being of the finer counts, will not be lessened by the native mills; on the contrary, it is probable that as the Chinese improve in hand-loom manufactures and take to weaving finer cloths, the import from England may increase.

The India import is of counts 8's, 10's, 12's, a little of 14's, and great deal of 20's. The Chinese mills spin mostly 14's, some 10's, and 16's, but nothing finer. The right lately conceded to foreigners to manufacture in China gives our merchants and capitalists an opportunity of inaugurating a much better state of things. The value of Chinese exports would be greatly raised by partial manufactory sorting and grading in China of many staples, such as silk, wool, hides, furs, paper, and

tobacco.

#### CHANGES IN CONDITION OF TRADE.

The time has come when foreign trade with China, to be advantageous, should be conducted in a different manner from that of former years. Merchants from England, Germany, and America have hitherto been content to establish their headquarters at Shanghai or Hongkong and have a few branch houses at outports. None of the foreign employees have been expected to study the language of the people among whom they live, and the work of interchange in trade has had to be conducted by compradores as go-betweens. The consequence has been that usually the compradore has received two dollars for every one that has come into the hands of the foreign merchant. If the merchant had his own English, American, or German clerks, who understood the language of the natives and could thus deal directly with them, the profit of the merchant would be doubtless increased greatly. Compradores would still be necessary, but they could be kept in their place and be allowed only a fair commission for services rendered. As it is now, the compradore becomes immensely wealthy and actually turns the tables on the merchant, who, while he supposes himself to be the principal, is rather the agent of the crafty compradore.

Upcountry native merchants, wishing to do business with foreign merchants in Shanghai or any of the treaty ports, must now accept the compradore's terms or not do any business at all. All that is required is that the business recruit should learn enough Chinese to talk about a very narrow range of subjects. Except in the south and the neighborhood of the coast between Shanghai and Canton, one language, the Mandarin, is spoken over nearly the entire Empire, with slight local

variations or brogues.

The writer quoted above, Mr. Bourne, says:

In order to improve China's demands for our imports, her exports must be increased in value, and this can best be done by Englishmen living in the settlements like Shanghai and at suitable places in the interior, who, while managing steam shipping and developing the export trade, could at the same time distribute imports and be ready to engage in mining and engineering enterprises as opportunity afforded. Rich men will not live in the outports, and poor men can not make a living independently; therefore, the work must be done by rich firms or corporations able to support and train men in the Chinese spoken language and mercantile customs of the country. These should be young men selected at home for their business capacity.

The Chinese have not the institutions, the laws, or the personal character on which to base the elaborate structure of modern commerce.

Englishmen, Americans, Germans, or Russians living in interior cities or districts and pursuing their own interests can undoubtedly open the

country.

Many manufacturers of machinery and goods of various kinds in the United States write to the consuls for information concerning the methods of putting their goods on the market. I would say to such that we are badly handicapped by the fact that we have almost no American trading houses in China. There are a few American firms in Shanghai, but English firms having their headquarters in Shanghai or Hongkong have branch houses in all the outports. There are perhaps a score of such English firms, but not a single American house transacting business in this way in China. If our trade is to be extended in China, American merchants must pursue similar methods. At this port (Fuchau), at Amoy, and most of the outlying ports, there is not a single American house represented, while the English, German, and Russian, numbering perhaps 20, are each well manned with from three to four able foreigners to transact their local business. It is useless for Americans to expect that these representatives of other nations will handle our goods with the same energy as they do those of their own country, and thus help to displace them. The shipping business is also in the hands of these same English, German, and Russian houses.

Another matter of great importance is to have commodities made to suit the capabilities of the people. Nine-tenths of the people are very poor. When men have to work for from 10 to 20 cents per day, and that payable in a depreciated currency which is equivalent to only 7 to 10 cents gold, and are expected to support a family of from 3 to 8 persons, they certainly have to live on the selvage of comfort; the mere necessities of life demand a struggle, and no luxuries are possible. When our home merchants and manufacturers read that a country of 400,000,000 of people is being opened up to trade, they should remember that not more than one in ten of that number can for years become purchasers of the smallest product of foreign manufacture or growth.

A large proportion of the people who are able to purchase foreign material must have a taste created for foreign food, wearing apparel, furniture, machinery, etc. At present, they do not want labor-saving machinery, for the great problem in this country is to get something for the hungry multitude to do, that they may obtain a bare living for

themselves and their families.

# NAVIGATION OF INLAND WATERS.

A few months since, permission was given by the Government for navigation of inland waters by native and foreign steamboats. As an immediate result, there is a great demand for steam launches of light draft to carry passengers and freight. At the present time, agents are scurrying around Hongkong, Shanghai, and Japan in earnest search for such craft. They are needed for immediate use in great numbers, and the demand will increase for the next two or three years. I know of parties who have sent agents to Japan in fruitless effort to obtain such vessels. I hear of several local companies being formed to open lines as soon as suitable boats can be obtained, running from this port along the neighboring coast and up the various streams, both north and south of this city.

At present this commerce is carried on in junks or by the slower

<sup>&</sup>lt;sup>1</sup> See Advance Sheets, No. 121, May 21; Consular Reports, No. 214, July, 1898.

method of overland carriage on the shoulders of coolies. The class of engines required for such boats can not be built at present in China, though the hulls could be made by the junk builders. I should think there would be a good opening for foreign machine shops for the making and repairing of engines, such as will be required by this traffic in every treaty port in China.

# PATENT RIGHTS AND COPYRIGHTS.

There is no international treaty with China granting patent-right protection to foreign inventors or copyrights to authors for their works. This can only be provided for by treaty provision. Any American patent right can be protected, before any American consul, against any other American citizen infringing on that right, and such case would be decided according to the laws of the United States, but natives can manufacture any article they choose to copy.

American books may be reprinted, trade-marks copied, and goods reproduced ad libitum. Where complaint has been made to the consul or minister that American products are being copied and trade-marks used, and the manufacture is shown to be fraudulent, the consul can sometimes obtain redress, through the courtesy of the local official, on the ground that the party is obtaining money under false pretenses.

During the month of June last, application was made by American Methodist missionaries at Fuchau, in behalf of a native inventor, to obtain a patent from the central Government for a very simple but efficient machine for spinning yarn. The man was very poor, but quite a genius, having very unusual inventive capacities, a thing almost unknown among the Chinese, who scarcely ever originate anything new, but are eternal copyists. The missionaries desired to use this machine in industrial-school work, and a company was formed among the laymen in Philadelphia to supply the funds necessary to enable this native to perfect his invention and afterwards to manufacture the machines in the United States. Application was made to the Government at Pekin, and after several weeks of delay and a visit of the inventor in person to His Excellency Li Hung Chang and an exhibition of his machine before the Tsung-li Yamên, the matter was brought to the favorable attention of the Emperor and patents were issued, being the first ever taken out in this Empire.

As a result of this movement, on the 5th of July, 1898, an important decree was issued, and the way was prepared for the introduction of copyright and patent laws for the protection of native inventors, but there was no reference therein to any protection for foreign inventions.

On the 13th of July, 1898, this additional edict was issued, authorizing the granting to authors and inventors of rewards, such as patents of hereditary nobility, substantive official ranks and posts, brevet buttons, permission to reap the sole pecuniary benefits arising from authorship or invention, or eulogistic tablets.

#### KEROSENE OIL.

During the year 1897, there was a great falling off in the import of American kerosene at this port, due chiefly to the introduction of a cheaper oil from Sumatra, and large shipments of Russian oil.

Advance Sheets, No. 222, September 17; Consular Reports, No. 218, November, 1898.

The following table compares the shipments for the years 1896 and 1897:

	1896.	1897.
American	Gallons. 1, 475, 995 55, 000 120	Gallons. 697, 320 1, 846, 360 458, 520

The following table shows the comparative import for the first six months of 1897 and 1898:

	1897.	1898.
American Russian Dutch	Gallons. 167, 060 844, 265 30, 000	Gallons. 2,000 493,425 696,860

In the following tables, it is impossible to tell what amount comes from America, as the goods are first received at Hongkong or Shanghai and reshipped to this port, and are of course entered at the custom-house here as from Hongkong or Shanghai, the country producing them not being declared.

SAMUEL L. GRACEY, Consul.

FUCHAU, September 21, 1898.

Trade report for Fuchau, China, from January 1 to June 30, 1898, as compared with same period of 1897.

# HANKAU.

The condition of trade in this part of China during the past six months has been fair. In some articles of export, it has been greater

than in any previous year.

Hankau is 650 miles from the ocean, situated on the north bank of the Yangtze Kiang, in the most densely populated portion of China. Separated from it by the Han River, on the west, is the city of Hanyang. On the opposite bank of the Yangtze is Woo Chang, the capital of the province of Hoopee. It is estimated that these three cities contain a population aggregating 1,500,000, and that the number of people contiguous and depending for their trade on these three cities are more than 70,000,000. It is impossible to estimate correctly Hankau's volume of business, owing to the fact that no figures are given for a vast amount of the native trade.

In the imperial customs reports, Hankau ranks as the second commercial city of the Empire, and stands second to Shanghai as a distributing center, although all her imports have to pass through the

latter port and be reshipped there.

The total amount of the tonnage that entered and cleared here during the past year amounts to the enormous figure of over three and one-third millions. This does not include an immense native tonnage,

of which no account is kept.

Hankau is the largest tea market in China. It is said that one-third of the commerce of the Empire passes through the Yangtze Valley, and that can easily be believed when we take into consideration the number of rivers that empty into the Yangtze, both on the north and south. Above this point some have their sources on the western borders of the Empire, and their waters carry much of the trade of Burmah,

Tibet, and other parts of central and northern Asia. A large portion comes up to this port, and all going up or down the river has to be

reshipped at Hankau.

The coup d'état at Pekin and the rebellion in the province of Szechuan near Chung King affected business more or less. The latter almost completely stopped the river traffic above Ichang, 400 miles above

### TRADE WITH THE UNITED STATES.

It is very difficult to obtain figures or to estimate the amount of goods imported from the United States and reshipped into the interior, as household goods, groceries, provisions, ready-made clothing, medicines, and many other articles are entered duty free, and the duty on all other imports is collected at Shanghai on a basis of 5 per cent ad valorem. Further duty is paid on them at Hankau, unless reshipped from this port. All goods, except personal baggage under a transit pass issued by the customs, then pay a duty of 2½ per cent; or, if preferred, the shipper can pay likin (local duty), which may be more or less than this per cent.

A further difficulty is that many of the most important articles imported from the United States are put down in the Customs Gazette as English and American goods, but with no statement as to what country they are from. This causes the United States to appear at a

disadvantage, which should be corrected.

It is gratifying to notice that goods from the United States are kept both in the native and foreign stores here. The following are most commonly seen: Kerosene oil, drills, shirtings, sheetings, muslins, calicoes. jeans, clocks, watches, stoves, wire nails, wire, tools, guns, ammunition, a few sewing machines, lamps, lamp chimneys, flour, crackers and biscuits in sealed cans, hams, boiled hams, potted meats, corned beef, lard, cheese, soap, condensed milk, butter, honey, syrup, maple syrup, candies, canned goods, dried fruit, oatmeal, chocolate, cocoa, spices, plum pudding, jams, jellies, tobacco, cigarettes, patent medicines, California wine, beer, and whisky.

There are about one hundred bicycles here, three fourths of which are from the United States. There are no roads to ride on, except in the foreign settlement and along the river bank for a short distance; yet there have been about forty bicycles imported from the United States the past year. Most of them have steel rims, which are considered more durable, owing to the intense heat and moisture of this climate. Many wheels are owned by Chinese, and a large trade could be done, if cheap, durable bicycles were placed on the market. The prices

have been from \$100 to \$250, Mexican.

American drills show a large increase during the last three years. For the quarter ending June 30, 1895, the number of pieces of English drills imported was 10,298; American, 33,485. For the quarter ending June 30, 1898, the figures were: English, 3,030; American, 58,470.

The Customs Gazette, which is under English supervision, says the favor which American goods finds in China is due to their cheapness and lower freights. One firm in Shanghai imported 5,000 clocks last year

from New York.

The leading article of export from the United States to China is kerosene oil. During the six months ending June 30, 1898, there have been shipped to the four open ports of this consular district, viz, Hankau, Kinkiang, Shasi, and Ichang, 5,595,650 gallons. The shipments of Russian oil to the same ports amounted to 2,750,000 gallons. Sumatran oil for the quarter ending March 31, 1897, amounted to only 99,300

gallons. It increased in the quarter ending June 30 last to 1,791,100 gallons, Russian oil decreasing for the same period to 750,000 gallons. The wholesale price of the Russian and Sumatran oil is 26 cents (Mexican), while that of the American is 29½ cents (Mexican) per gallon. The former two retail at about a cent and a half per gallon less than the latter. I know of no other reason why the Sumatran oil should have made so great an advance in so short a time, except that it has been in the hands of an active manager, and sells for about 30 Mexican cents less per case of 65 pounds.

The amount of American clarified ginseng that was imported into this district for the half year ending June 30 last, was 109,733 pounds. It is used as a tonic more than any other medicine in the Empire, in nearly all classes of disease. Large quantities come from Korea, Japan, and the imperial domains of China, the latter being worth more than its weight in gold. The price of the American at wholesale is \$12 to \$14 (Mexican) per pound, and at retail, \$40 to \$70 (Mexican) per

pound.

The quantity of Schlitz (Milwaukee) beer that is being imported is rapidly increasing, and it appears to be on sale in many places here. This is due, probably, to judicious advertising and active agents. American whiskies are little in demand. Those labeled Scotch seem to have the greater sale, the so-called quart bottle selling at about \$1 (Mexican).

# EXPORTS.

What is called the muck-and truck season of trade opens at this date, and includes most of the following products coming to this market: Jute, season from August to October; output, 350 tons annually. Hemp, of which there are several varieties; annual product, 4,000 tons; first crop, July; second, August; third, October. There is a large export trade in this article, and the crop is contracted for early in the season, which closes about the 1st of March. Rhea fiber for making rope, 300 tons annually; season, from July to October. White wax, annual product, 300 tons. Bristles, packed here in two styles (Hankau and Canton), exports, 500 tons yearly.

Oil, also called wood oil, is used by Chinese for varnishing junks, etc. Large quantities are exported to Europe for making soap. It is also used by Chinese in the manufacture of ink. Season, from October to

March. Annual export, 17,000 tons.

Cantharides are little used here, but about three and a half tons are exported annually; season, October to March. Firecrackers have an output of 500 tons yearly. Japan is the best customer. Potash, 200 tons, little of which is exported. Buffalo horns (water), output 1,500 tons. Gallnuts, yearly product 350 tons; large exports to Europe; season, from August to March. Vegetable tallow, annual output 6,000 tons; largely exported to Europe.

Arsenic ore is ground by the natives and used extensively by scattering it over fields after harvest, in order to destroy insects and worms. A solution is also made, paper saturated with it and a taper prepared, which is burned during the day and evening for the purpose of killing

and keeping away mosquitoes.

### MINERAL PRODUCTS.

The provinces along this valley are rich in ores, but they are guarded carefully, as a rule, from the foreigner, although there has been considerable antimony ore exported by foreigners during the past year

from this province, and a smaller amount from the antiforeign province of Hunan.

Ten thousand tons of zinc ore were taken from the mines in Honan the past year. Galena is found in abundance in Szechuan province; copper in Honan, Hunan, and Szechuan; iron in Hupeh and Szechuan; coal, anthracite, in Hupeh, Honan, and Szechuan; coal, bituminous, Hupeh, Honan, Szechuan, Gunan, and Kwangsi.

Hupeh, Honan, Szechuan, Gunan, and Kwangsi.

Kerosene oil is found in Szechuan, and a French syndicate is endeavoring to secure control of it. The gold mines in Hunan province are being worked in native style to a small extent, specifications

for mining machinery having been sent the first of this month.

# FUEL.

The natives seem to prefer coal dust as fuel to lump or hard coal. A good quality of coal dust is taken and mixed with one-third the amount of clay, and sufficient water to make a cake or ball about 3 inches long, 2 inches wide, and one inch and one-half thick. It is put in the sun until dry and then used for fuel. It burns much longer than the plain coal and retains more heat. The lumps are also used in the hand stoves that native women carry in their wide sleeves, and also at night in native beds, as the people have no stoves in their houses. Ordinary soft coal sells here now for 10 Mexican per ton; last spring, it was 13 Mexican.

#### TEA.

The tea season begins here April 15 and closes July 15. There are three crops marketed during that time. Buyers come here, when the season opens, from several European countries; one came from the United States this year. The Russians have almost a monopoly of the trade, and have several factories here for manufacturing tablet and brick tea, which is made out of the sweepings and poorer quality. The work has to be done during the warm weather of summer and autumn, as the tea does not mold properly in cold weather. The tea season just closed has been the most successful ever known. Prices were higher than last year, running from 10 to 45 taels per half chest of tea (about 66 pounds each), which amounts to from 6 to 25 cents, United States currency, per pound, depending on the rate of exchange. The amount exported for 1898 was 910,355 half chests, as compared to 788,128 half chests for 1897. Of the crop of 1898, 45,052 half chests were exported to the United States.

### HOW TO INCREASE TRADE.

There is no doubt that China is one of the greatest markets now open to receive American goods, and the demand will certainly continue to grow if the trade is properly worked up. So far, Americans have done but little to secure the trade, while England, Germany, France, Russia, and Japan have for years been on the alert to introduce their goods into every open market of the Empire. They have their firms and experienced agents in every port. There is no use sending advertisements in English; they are usually flung aside and not read.

Chinamen always want to "look see," and if we wish to secure our share of the trade of this country, there is no better way than to establish museums in the larger open ports and allow the Chinese to see what we have to offer them. There should be men in charge who speak

the Chinese language, to act as commercial agents.

The viceroy at Wuchang, across the river, who is considered one of the greatest men in China, and certainly among the most progressive, Chang Chit-Tung, has built here (out of his own revenues) iron works, arsenals, and cotton mills. I know personally that he would be pleased to have a museum of American goods established at this port. If the manufacturers and merchants of the United States seek the trade of China in a systematic manner, I feel confident they will be abundantly rewarded. I have received a number of letters of inquiry regarding commercial agencies in China, similar to Dun and Bradstreet, or how to procure reliable information as to the financial standing of business houses in this country. At all the larger open ports there is a foreign chamber of commerce, which issues weekly bulletins, showing the amount, price, and variety of merchandise sold in that market during that period. The secretary acts as a commercial agent for information for the foreign trade.

In the native cities, there are guilds of every profession and trade. including beggars and thieves, and every one must join a guild or he will not be recognized in his line of business. Commercial guilds meet at least once a week and fix the price of their specialties. These guilds are in correspondence with similar organizations in other parts of the country, and are thus informed of the standing and responsibility of business houses in every city. When members visit a city, they put up

at the guildhall and are entertained there.

#### TRANSPORTATION.

In order to answer inquiries regarding transportation facilities to river ports on the Yangtse, I would state there are six regular lines of steamers plying between here and Shanghai the year round, each making a trip about every ten days. Four of these lines are English, one Japanese, and one Chinese. They all do a large business, both in freight and passengers, accommodations for foreigners and natives being separate. The majority of their captains are citizens of the United States, and have been running on the river from fifteen to thirty years. Besides the above lines of steamers, there are many lochers (300 to 500 ton vessels) and junks carrying mixed cargoes between the above ports. At Hankau, all goods intended for up-river ports are reshipped. Three of the above firms have small steamers which make weekly trips to Ichang, 400 miles west. At Ichang, goods and passengers are reshipped in junks and house boats.

The railroad being built between here and Pekin is progressing slowly in the hand of the Belgian syndicate. It is claimed that it will

be completed in three years, but that is very doubtful.

# FOREIGN INSTRUCTION.

At Fou Chang, the viceroy has endeavored to establish a university with foreign instructors. There are several departments but no head, each instructor deciding how his department shall be managed. There are three German military instructors, one each for the infantry, cavalry, and ordnance. The branch of chemistry is presided over by a competent Englishman. The students study only one thing at a time. The missionary schools are doing effective work, and merchants and others who can send their sons to the former schools free prefer to pay \$5 a month and send them to the latter.

# GENERAL.

Mr. Brill and his assistant, Mr. Gilmore, citizens of the United States and graduates of Cornell, have come to Wu Chang during the past

year, under a three-years' contract with the viceroy, to open a farm and introduce American grains, trees, fruits, vines, etc. They have brought with them a large variety of farming implements and various trees and plants. Instead of being given one or two hundred acres of suitable ground, after several months of waiting, they have been allotted 5 acres in the city that have been used as a dumping ground for brick, lime, and rubbish, totally unfit for their use, and have been informed they can have it for this year, but that it will be needed next year for a drill ground. Four coolies with a head and second boss have been put at their disposal. They work only when they are watched. The Chinese seem to think that if they have experienced men at the head of an undertaking, little else is required.

Two match factories have recently been started here, though most of the matches come from Japan. The iron works are making rails for the Hankau and Pekin Bailroad. The output will be small, and most of the rails used will have to be imported. The American and English

superintendents at the works have been replaced by Belgians.

At the arsenal, they are making rapid-firing field guns and Mauser rifles out of a poor quality of steel. I was informed by the superintendent that he had made an estimate of the cost of manufacturing these rifles, and found it was twenty times what they could be purchased for in Europe. He said it took eight to ten Chinese to do the work of one foreigner. As we passed through the arsenal at 1 p. m., here and there a Chinese workmen was sitting on his stool fast asleep, while his machine was running. The coal used at the works is soft, bituminous slack, procured back of Wu Chang. The mines are not open for public use.

The attempt to make coke at the iron works was a failure, the quality being poor. The iron ore is brought from 60 miles down the river on barges. The coke used comes from Tientsin.

The Japanese have recently secured a concession here, and have

established a consulate.

L. S. WILCOX, Consul.

HANKAU, October 15, 1898.

# HANKAU TEA TRADE IN 1898.

Under date of January 12, 1899, Consul Wilcox transmits from Hankau the annual tea report of Messrs. Evans, Pugh & Co., extracts from which follow:

Supplies of Hankau teas for the past five seasons have been as follows:

••				•

FREIGHTS.—For London the Oanfa was dispatched with a full cargo on June 8, at 52s. 6d. per ton. This rate via Conference steamers has been without alteration throughout the season.

For Russia direct there were 5 steamers for Odessa and 1 for St. Petersburg which loaded on private terms, being the same number as last year. For Tientsiu and northern ports all shipments have again gone forward by river steamer with transshipment at Shanghai.

# TIENTSIN.

Tientsin is situated at the junction of the Huei River (sometimes called the Grand Canal) with the Peiho River, in latitude 39° 3′ 55″ north and longitude 117° 3′ 55″ east. It is distant from Pekin by road about 80 miles. Formerly, it was a military station only, but toward the end of the seventeenth century became a city of great importance. To-day, it is the home of 1,000,000 people, with an annual import and export trade aggregating 65,000,000 taels¹ (\$42,250,000). In former years, steamships landed their passengers and cargo at the bund in Tientsin, but for three years past, the Peiho River has been unnavigable, excepting for boats of very light draft, since which time cargoes have been shifted to lighters at Tangku (mouth of the river) and thence hauled to Tientsin by tugs, a necessity that adds greatly to the cost of transportation. At one time, the volume of water flowing down the Peiho was vast, but many canals have been constructed, causing the river channel to become so shallow as to create consternation among shippers and property owners, who supplicated the consular body to devise some means for improvement. After many meetings and much

<sup>&</sup>lt;sup>1</sup> Consul Ragsdale values the haikwan tael at 65 cents; the estimate of the United States Director of the Mint, Jan. 1, 1899, is 72.2 cents.

consideration, it was determined to raise a fund of 250,000 taels (\$162,500), to be expended in improving the water course. The viceroy assumed the responsibility of raising 100,000 taels (\$65,000) and the consular body the further sum of 150,000 taels (\$97,500) by means of a loan to be repaid out of a bund or landing tax, levied by authority of the French and English municipalities—a scheme approved by the diplomatic body at Pekin. The money has been secured and is now in bank, and the work of improvement will commence immediately, and, it is hoped, will be successful.

# IMPROVEMENTS.

The growth of Tientsin within the past few years is most astonishing. The mud holes and swamps of a few years ago have been filled in; one, two, three, and even four story brick buildings erected; streets macadamized, trees planted, gas works constructed, and now pipes (from New York) for a very elaborate and perfect water system are being laid—all due to foreign enterprise. On the other hand, the Chinese authorities have been seized with the spirit of progress, and to them is due the building and furnishing of the Imperial Military College, the Imperial University, arsenals for the manufacture of guns and ammunition, a mint for the coinage of silver, and last but not least, 320 miles of a splendid railway. Machinery has also been purchased for a complete woolen mill, and many other improvements are now under consideration.

### THE IMPERIAL UNIVERSITY.

The university was established in 1895 by its president, Mr. C. D. Tenney (former United States vice-consul at Tientsin), at the request of His Excellency Sheng Hsuan, with the advice and approval of the Emperor. His Excellency Wu Ting-fang, present Chinese minister at Washington, and Mr. Ts-ai Shao chin, members of Viceroy Wang's staff, were the first directors. The university is divided into three departments, viz, collegiate, preparatory, and railway. The preparatory course covers four years, after which the students enter the collegiate department, where they remain another four years. the end of the first year in the collegiate department, the students are drafted into special classes—civil, mining, and mechanical engineering, and law. Each special branch is in charge of foreign professors, assisted by Chinese professors. The railway department was organized for the purpose of providing men for subordinate positions in the railway service—draftsmen, engineers, station masters, etc. The students are admitted to the various departments by competitive examinations. The government of the university is solely in the hands of the president and directors, the former being responsible for the educational work of the institution. Thirty students in each class are supported by the Government and are bound to Government service after their graduation. The present number of students is 250, and the annual expenses are 60,000 taels (\$39,000), entirely borne by the Government. The president and four of the five professors are citizens of the United States.

# THE IMPERIAL MILITARY COLLEGE.

This college was established by His Excellency Li Hung-Chang, the viceroy of Chihli, in the year 1884. At the beginning, it was simply intended to give employment to the German officers under contract

with the Government, but the necessity of training men in the arts of war led the viceroy to memorialize the Throne in behalf of a permanent military college. A suitable building was erected, at a cost of 50,000 taels (\$32,500), and the annual expense of maintenance is about the same amount. The students are drafted from the different military camps, and they are supported by the generals under whom they are serving. After a two-years' course, they return to their respective commands as instructors. The school is under the directorship of Taotai Yint Chang, a Manchu, who received his military education in Germany and held a commission of lieutenancy in the Austrian army. All the principal instructors are Germans, most of them being noncommissioned officers. The course of study and training is practically the same as pursued in most military institutions. The German instructors do not understand the Chinese language, and give their instruction through interpreters. Many of the graduates are now holding prominent positions in the army and civil government.

### THE CHINESE MINING COMPANY.

This is a commercial joint-stock company, with headquarters at Tientsin. The shareholders are private individuals. Their mines are located at Tong Shan, about 180 miles north of Tientsin, and at Linsi. The daily output of coal is 1,500 tons at the former and 700 tons at the latter place. They employ 8,000 to 10,000 men, the native operators receiving an average of 20 cents (Mexican) per day. The pit deputies and overseers receive \$20 to \$60 (Mexican) per month. There are 11 foreigners employed—one Austrian and the remainder British subjects. Besides these, there are 5 Chinese, educated in the United States, 2 having studied at Lehigh and Lafayette Mining College. One is now chief mining engineer at Linsi and the other technical manager of the Tong Shan colliery. A third was an undergraduate of Yale, class of 1884, where he took honors in the classics. He is now the company's chief secretary. The fourth is translator, and the fifth shipping manager and also chief secretary to the chief director. The salaries paid foreigners vary from \$1,200 to \$3,500 gold per annum. The company owns six steamers, which are constantly employed in transporting coal to southern ports. This company also owns and operates a silver mine in Mongolia, the machinery for which was purchased from Frayer & Chalmers, of Chicago. The machinery for the coal mines was purchased in England and Germany.

### THE IMPERIAL CHINESE RAILWAY.

This railway is without doubt one of the greatest enterprises in northern China. Already, 320 miles of road have been constructed (80 miles of which are double track) and 125 are now under construction. The company has 64 engines of Chinese make, 4 Belgian, 21 American, and 38 English. From 8,000 to 12,000 men are constantly employed, 42 of whom are foreigners. They have extensive shops at Tong Shan, where cars of all kinds are built. The cross-ties and bridge timbers are imported, principally from Oregon, although small shipments, far inferior in quality, are received from Japan. The road is gradually being extended, and ere long, will be completed to Niuchwang, one of the terminal points of the Russian Railway. The traffic for the past eleven months was as follows: Passengers carried, 1,216,885; freight, 1,870,118 tons. The traffic is rapidly increasing, and already, the road is paying handsome dividends.

# GOVERNMENT ARSENALS.

The Government has erected at Tientsin two arsenals for the manufacture of munitions of war of every description—shells, cartridges, torpedoes, powder, gun cotton, guns, etc. In 1896, machinery was added to one of these arsenals for the purpose of coining silver dollars, half dollars, 20, 10, and 5 cent pieces. The coinage for 1897 aggregated the sum of \$1,176,555.60. The vast machinery in these arsenals was purchased in Europe, and the superintendent and assistants are English subjects. There are 2,500 men constantly employed in the two arsenals.

#### TRADE OF TIENTSIN.

The following comparative tables will give some idea of the trade of Tientsin:

# Gross value of imports and exports.

Description.	1895.	1896.	1897.
Imports: Foreign Native. Exports (native)		Hk. taels. a 29, 584, 743 \$22, 963, 641 21, 599, 781 17, 495, 822 8, 561, 840 6, 935, 090	#k, tacls. a 30, 306, 701 23, 337, 466 11, 000, 044 8, 140, 032

a The reductions to United States currency in this table are made on the basis of the estimates by the United States Director of the Mint, the average for each year being taken.

It is impossible to give the exact imports from the United States, as more than half of the goods comes through Shanghai and Hongkong importers, and on arrival here is listed as native imports. It is safe to say, however, that our trade is increasing yearly, and, if properly managed, would increase rapidly. It is unfortunate that most

agents for American products are foreigners, and even when these are American, the clerks are nearly all foreigners. If our merchants would provide for sample warehouses at Hongkong, Shanghai, and Tientsin, and send good, live, and responsible Americans to manage the same, they would be astonished at the increase in their exports. The Germans are preparing to adopt this method, and, unless checkmated, will make sad inroads on the trade we now have. They are also getting ready to publish a paper in the Chinese language especially to advertise their products.

Again, our manufactured goods are being constantly counterfeited. Fairbanks's scales, Columbia bicycles, and many other standard articles are made in Japan and shipped here for half the price of the genuine article. They are equal to our products in name only. A graphophone is made in Germany and sold here for the genuine Edison. It is,

indeed, a very poor imitation.

The number and tonnage of vessels entered and cleared under each flag for the year ended December 31, 1897, is to be found in the following table:

#### ENTERED.

# HONGKONG.

A careful survey of economic conditions in Hongkong during the first half of the year 1898 reveals two facts: First, a general, permanent increase of trade; second, unusual activity in mercantile circles, owing to the great demands made on the local market by the large American squadron and army on this coast. While this second condition may be temporary and may carry with it corresponding depression in some lines, I predict that it will be of great permanent benefit to American exporters. Nothing that could have happened to this coast would be of so great a help in the introduction of American goods into these markets, as the presence of so large a body of American consumers in

our midst. Our forces of occupation have done more than conquer a country; they have made an impression on Asiatic markets that can never be effaced. When our fleet first arrived here (in February, 1898), there were a few sample cases of American tinned milk, fruits, meats, whisky, beer, etc., in the big English and German wholesale houses. The imports from America were made up almost wholly of California flour and American kerosene. To-day, every steamer and ship from America brings cargoes of American goods. While their ultimate destination is Manila, they are handled by European firms here and come before the public in such imposing quantities that first curiosity is aroused and demand follows. The great difficulty in the past has been to get the great body of Chinese consumers to sample our manufactures. Even if this were possible, the goods came over in small consignments and at prices which were prohibitive to all but those who could afford to pay for luxuries. With the influx of the Americans into Manila, American firms have found it to their advantage to send out men to study the needs of this climate. Already, one house has been established in Hongkong with a branch at Manila, which is meeting with gratifying success.

I am informed that there is a shipment of 45,000 bales of upland cotton from Texas on its way here, which has been purchased by a large Chinese firm and is laid down here as cheaply as the Indian cotton. The trouble with the introduction of cotton hitherto, has been that American producers have tried to place on the market the lowland cotton, which is too heavy a staple, besides being too expensive. Even our upland cotton is superior to the best Indian growth. The new cotton-spinning mill, regarding which I wrote on January 15, 1898, is nearing completion, and it is hoped will be in operation early in the year. It will create a new market for cotton in this colony. If our upland cotton can continue to compete with the Indian and Chinese growths, the demand will be almost unlimited, as Hongkong is the feeder for three of the richest provinces of southern China, with a population

of over 80,000,000 people.

A representative of a cotton-spinning works in Connecticut is expecting, in a few days, to receive a full line of samples which were made according to specifications sent from here. He told me that the managers had never understood this market before, and, now that they did, they would find no difficulty in introducing their goods. He has also solved a problem regarding which every consul in the East has been reporting for the last decade—that is, that it is impossible to obtain the same prices for the same quality of goods on the Asiatic coast that you do in America. Our merchants never seem to realize that Hongkong (the feeder of southern China) is an absolutely free port, and that goods manufactured in the United States come from a country in which a tariff prevails. If the American manufacturer wishes to compete in these markets, he must deduct from the price of his goods the extra amount he usually adds on account of this protective tariff. For instance, there might be a vast market on this coast for American gunpowder, if the manufacturer would make it a point to compete with the German article. At the request of Messrs. Lauts, Wegener & Co. (a leading German firm), I procured samples of gunpowder from the California Powder Works. After a careful examination, they wrote me as follows:

As we are importing this article in very large quantities from Germany, these samples were naturally of great interest to us; and we may say that the quality of the powder would do very well if it could be laid down here at no higher price

<sup>&</sup>lt;sup>1</sup>See Advance Sheets No. 59 (March 12); Consular Reports No. 211 (April, 1898).

than the German make. The prices before us, we are sorry to say, are too dear, according to our calculation. While we could buy the German powder at a price which would allow us to sell the same in this market at \$3.86 Mexican per keg of 20 pounds, we find that for the quality marked "A" we should want at least \$5.10 per keg of twenty pounds—a figure which is, of course, out of the question.

### CALCULATION.

1,000 kegs of powder, of 20 pounds, at \$2 gold per keg Free on board San Francisco, less 2 per cent	\$2,000.00 40.00
Freight at, say, 20s. per ton on 10 tons	1, 960. 00 50. 00
Landing       per cent       1         Telegrams and brokerage       do       1         Discount       do       2         Return to dealers       do       2         Interest       do       3         Commission       do       5	2, 010. 00
Totaldo14	281.40
At exchange (\$1 Mexican=45 cents United States), \$5.10 per keg	2, 291. 40

It would seem easy for any American powder company to figure as follows: "We have our plant, and have a market in America for all the powder we can turn out by working twelve hours a day. For this powder we are getting the equivalent in America of \$5.10 per keg of 20 pounds. Now, we find that by increasing our force and working the same machinery we can afford to turn out twice as much gunpowder, so that we can make a profit by selling the surplus at two-thirds the cost of the first output. In this way, we should be able to compete with German gunpowder in the Asiatic market."

A policy similar to this has introduced our plows and wagons into

Mexico and our sewing machines and bicycles into Asia.

Since the arrival of the American squadron, at least three brands of American beer have firmly established themselves here and one brand of whisky. Canned meats and fruits have also come to stay. Our bicycles are favorites; but as the opportunity of using them is restricted, the demand can never be great or worthy of serious competition. Within the last three months, the agent of an American sewing machine obtained an order for 1,200 machines from an English firm and at the same time an order for a considerable number of bicycles, which his company makes with the same plant that it uses for the sewing machines. There will be an increasing demand for cheap sewing machines among the Chinese, and energetic measures ought to be taken to control the market.

In my report on American butter and canned milk, published in Consular Reports, No. 211 (April, 1898), I pointed out how difficult it was to get the consumers of this market to sample our goods, and said:

People here pay \$1.30 Mexican (62 cents gold) a tin for English tinned asparagus, when the same firm (Lane, Crawford & Co.) sells the finest California tinned asparagus for 55 cents (26 cents gold), better goods in every way and one-third as cheap.

Since the publication of my report this firm writes me as follows:

American asparagus is selling steadily. \* \* \* As to quality, we should put the American tinned article on a par with the English and French, although it is, of course, cheaper than either. \* \* \* You are right in saying that Danish butter

is the most popular here; it is the best commercially—that is, regarding both quality and price—and we have tried all sources of supply, including America and Australia.

The trade with the Chinese is a peculiar one, requiring much patience, tact, and perseverance. Generally speaking, the class of goods most in demand is of a cheap, flashy nature, commonly known as Birmingham wares, and those of a kindred class, "made in Germany," in imitation. The Germans are the sole importers of the latter, and their small commissions and methods of doing business enable them to compete keenly with the former. The method of carrying on business is peculiar to the East. Credit of from three to four months is usually given, but it is worthy of note that its observance is oftenest respected in the breach. In consequence of keen competition, the agreed term is often disregarded, the Chinaman taking delivery and paying for his goods in installments to suit his convenience. spite of this, fresh sales are successively made with him on same terms, until this style of trading has now become generally established. trade-mark, or "chop," after it has secured popularity, is of far more importance than the quality of the article itself. A marketable article bearing anything but a favored chop will often prove unsalable, almost at any price, and the Chinese not unfrequently use this as a pretext for depressing the market and refusing to take delivery of orders when the slightest shade or shadow of a difference either in size, color, or design of a chop can be detected. All running accounts between natives are supposed to be settled by Chinese New Year, and any failures in this respect affect the credit of the defaulter. The Chinese are most energetic collectors of all sums due them by Europeans before the above date, while outstanding contracts on their part, or deliveries not taken, are indifferently allowed to stand over, with promises for early settlement. German houses grant these facilities, and others are obliged to accept the terms of the Chinese in order to retain their patronage, and perhaps secure a share of new business during the incoming year. Chinaman is most stolid and indifferent, and reveals little or no facial emotion over either a profit or a loss. He seldom admits a profit from anything purchased of a seller, and in cases where his prospective profit was to have been 40 per cent, and he only realized half of it, he will lament, and if pressed, declare that he actually sustained a loss of 20 per cent.

In the sale of tinned milk to Chinese (whether it be a purchase made locally or the acceptance of his order), his coolies are allowed to open every case, remove the wrappers, carefully inspect each tin, reject all those bearing the slightest defacement, spot, or blemish to label, and replenish the short cases with acceptable tins. The rejected ones they decline to take, except at greatly reduced prices, and often refuse to take them at all, but buy them later in the auction room at their own prices, where the dealers combine and determine the selling price. I do not know of such combinations existing anywhere else. This system of picking over and selecting the fittest is generally allowed, and the sale of watches, clocks, umbrellas, shoes, and in fact of almost everything, is not exempt from this pernicious system, which the merchants seem compelled to tolerate, in their anxiety to do business. In fact, one rash enough to hold out for reform would have to at once put up the shutters.

The above is cited as an inseparable condition of commercial relations with Chinese, and will no doubt excite the curiosity of our trades

people. We know that trades unions throughout the United States are powerful and influential, but they listen to argument. Not so in China; in no country do these unions, or guilds, as they are called, exert a more autocratic sway. Each branch of trade or occupation is represented by a guild, supported by contributions or taxes from its votaries. These guilds have no recognized head or place of meeting, their fiat being circulated unostentatiously by word of mouth; each one passing on the decree without comment or criticism, until, as if by magic, all of its members are found adhering unquestioningly to its dictum. As showing what close concerns they are, it may be mentioned that in cases where their influence has proved subversive of order and good government, the colonial government, with its staff of police and detectives, has never been able to point to their chiefs or to find their body in council. As before mentioned, a refusal to comply with the customary conditions of trade would call forth their action, the result of which would be a complete taboo of the obstructionist.

It must be borne in mind, however, if one accepts their methods of doing business and grants long credits, that, generally speaking, the Chinese merchant is reliable and trustworthy, large transactions being often successfully financed with nothing stronger as a bond than his word or a book record of the facts, written and retained by the prin-

cipal.

These facts about the Chinese should be borne in mind by American merchants who contemplate trading, not only in China, but in the Philippines, as in the latter place the Chinese are not only doing im-

portant business, but are controlling factors.

There is necessarily very great interest felt in the Philippine Islands, as the large English firms in business there have offices here, and the bulk of the transshipment cargo from all European countries save Spain goes through Hongkong. In the year 1897, 113 ships entered this port from the Philippine Islands (tonnage, 138,000 tons), carrying 106,431 tons. As a comparison, 151 ships entered the same year from Great Britain (tonnage 351,178), carrying 179,087 tons of cargo and 429,609 tons in transit. The ships clearing at this port for the Philippines were 109 (tonnage, 111,487), carrying 42,065 tons of cargo and 16,691 tons of bunker coal. During the same period, 109 ships cleared for the United States (tonnage, 224,945) with 173,020 tons of export cargo. Lamke & Rogge, brokers, in their freight circular dated October 15, say:

Philippine business has been transacted, notwithstanding all the difficulties that were stated to have arisen, and a number of boats has been taken up on time-charter terms at fairly good rates.

The "difficulties" referred to are principally the heavy tariff duties, which make it impossible to sell a certain class of goods in Manila at present. As an example, might be mentioned the return from Manila of 1,400 dozen bottles of aerated waters, in consequence of the duty being prohibitive. However, it is expected that these difficulties will soon adjust themselves. At date of writing, there is a demand for sailing vessels for American ports. There are eight sailing vessels in port at this moment, and cargo for New York is accumulating rapidly.

Regarding our principal imports from America—kerosene oil and flour—there is a steady demand. During the two weeks ended September 27, Shewan, Tomes & Co. report the arrival from the Pacific coast of seven steamers, carrying 527,132 sacks of flour, at a selling

price varying from \$1.40 to \$2.35 Mexican per sack.

For the half year ended September 30, 1898, the exports from this colony to the United States, as invoiced in this consulate, amounted to \$4,843,016 Mexican. In comparison, the exports to Manila between the dates August 18 and September 30, as recorded in this consulate, amounted to the magnificent total of \$1,222,968. To arrive at a true conception of the vast volume of imports that poured into Manila during the forty-two days cited, it would be necessary to multiply this by two, to cover the value of the transit cargoes that were not invoiced in this office.

In the harbor-master's report for the year 1897, the total tonnage entering and clearing from this port amounted to 15,938,174 tons. There were 38,713 arrivals, of a tonnage of 7,968,606 tons. Of this number, 4,618 were steamers, 356 sailing vessels, and 28,989 junks.

The following imports of the colony are of interest to the United

States:

Flourtons	85, 904
Flour	30, 581
Hempdo	43, 360
Kerosene:	-
In bulkdo	47, 782
In casescases.	1, 689, 688
Leadtons	5, 496
Sugardo	211, 777
Timberdo	64, 862

All of these items show an increase over the year 1896. During the year 1897, 48 American vessels entered this port with cargoes and 66 in ballast, while 102 American vessels cleared with cargoes and 10 in ballast.

It can readily be understood how difficult it is to cover the entire subject of imports and exports of this colony, when the fact that this is a free port, without a custom-house, is taken into consideration. The prosperity of the colony is rather reflected in the local newspapers and the "market letters" and "share reports" published by local firms. It is an interesting fact that, on account of its geographical position, the colony of Hongkong benefits commercially by political upheavals of any nature that occur on the entire Asiatic coast. If a rebellion breaks out in southern China, both the rebels and the Government come to Hongkong for their munitions of war, and, although the colonial government has for the past year forbidden the export of arms, thousands of Mauser rifles have found their way into the rebellious districts. numerous rebellions in the Philippine Islands that have occurred in previous years have made big demands upon this market for the sinews of war. Our fleet, it is estimated, left in Hongkong over \$2,000,000 gold during the war.

The price of silver has not varied greatly during the past two years,

its extremes ranging between 46 and 48 cents.

To endeavor to cover the entire commercial question in Hongkong would entail a report on southern China, the Philippine Islands, Formosa, and all adjacent territory, and involve interests so vast and varied that the impossibility of complying is apparent.

ROUNSEVELLE WILDMAN, Consul-General.

Hongkong, October 20, 1898.

# DECLARED EXPORTS, HONGKONG.

Value of the exports declared for the United States at Hongkong during the year ended June 30, 1898.

# DUTCH INDIA.

There has not been much change in general trade since my report of last year, although what there has been was on the whole in the line of improvement.

Sugar, the staple industry of Java, is in a better condition, and planters are feeling much encouraged. The Spanish-American war has been of benefit by entirely stopping the shipments of sugar from Cuba and the Philippines. The increase in price would have been still more marked, had it not been for the great increase in production of beet sugar both in Europe and America. The Brussels conference for discussing the abolition of sugar bounties caused planters to hold for higher prices, but the abortive ending of the said conference, due to the obstinacy of France and Russia, forced them to abandon hope. There was, however, no break in prices.

The shipments of sugar to the United States in 1897 were 47,707,221 kilograms (105,177,339 pounds) as against 109,753,886 kilograms (241,963,417 pounds) in 1896.

These figures are really not large enough, as many cargoes are shipped to Port Said for orders, which eventually find their way to the United States.

In 1898, the planters have done much better, as the Government at the beginning of this year repealed the export duty on sugar (see Consular Reports, No. 211, April, 1898, p. 530). It has been calculated that for the year ending October 15, 1898, the world's production was 145,000 tons less than the year before. All of which is of some slight comfort to planters, and they very much need comfort.

<sup>&</sup>lt;sup>1</sup>In reply to circular of August 5, 1898.

<sup>2</sup>Also Advance Sheets, No. 45, February 24, 1898.

Digitized by COOQLE

But if there have been a few alleviations of the misery of the sugar planters, the same can not be said of the coffee planters. They are, in truth, in a wretched condition, and in their case, the fault is laid at the door of Brazilian coffee, which has lately so declined in price as to ruin the market in America and in Europe for Java and other finer coffees. The Government still cultivates coffee, but owing to attempts to cut down expenses and diseases of the plant, the word "Government coffee" does not carry the same prestige in regard to quality as formerly.

To add insult to injury, there was actually some Brazilian coffee imported this year in competition with local coffee. Fortunately, the experiment was a failure, but if prices go much lower, no one can feel

sure that it will not be tried again.

Liberian coffee is grown very considerably, but it is a distinctly coarser grade and will never attain the popularity of real Java coffee.

It must be admitted that the planters are responsible for much of their present distress. The storm has been brewing for many years, but instead of taking warning and cutting down expenses, accumulating reserves, and generally preparing for possible hard times, they went on in their old scale of magnificence, and paid big salaries and big dividends as if both must last forever. The consequence is that they are caught unprepared and there is much distress. Many estates are being offered for sale at a sacrifice, and planters of long standing and experience are turning their attention to other things. They try to hope for better times, but with the increased exploration of Africa and South America and consequent opening up of new coffee land, I fail to see how anything short of a sudden and total annihilation of Brazil can help them.

The exports of Java coffee to the United States for 1897 were 5,065,547 kilograms (11,167,515 pounds) as against 4,414,866 kilograms (9,733,014 pounds) in 1896. As in the case of sugar, the real figures are larger,

as much coffee is shipped to Port Said for orders.

Tea is doing very well, but none was imported into the United States

last year.

Quinine and cinchona bark are very prosperous, and from time to time, shipments are made to the United States direct. (See my report on quinine, Advance Sheets Consular Reports, No. 204, August 27, 1898.¹) Up to date during this year, there have been shipped direct to America 88,100 ounces of sulphate of quinine.

I want to reiterate and emphasize what I said in my report above referred to, as to the great advantage it would be to the American trade to import their quinine direct from here, instead of having to pay the fancy prices of the European trust, as they now do. Java is trying to break the trust and should be encouraged, especially as success is

probable if not already assured.

For the last few years there has been a shortage in the world's production of quinine, and the deficit has been supplied from old stocks. When these stocks are used up, as they soon will be, there will be a crisis in the quinine market. Java will then control the world, as it produces already three-fourths of the entire output of cinchona bark. The Government cultivates the bark to some extent, and last year, made \$38,500 from the enterprise. It is hoped and believed that private enterprise will take hold of the industry more than ever, especially now that coffee has ceased to pay. Much of the coffee land is perfectly suitable for cinchona.

<sup>&#</sup>x27;Also Consular Reports, No. 217, October, 1898.

#### PETROLEUM.

I have reported several times in detail concerning the petroleum

situation here, and therefore will give but a brief résumé.

The situation, from the point of view of the Sumatra oil wells, is very disquieting. Improvident management, lack of capital, and declining oil supply are worrying the stockholders of the Dutch companies, and no one is willing to resort to the only remedy—the introduction of American capital, enterprise, and skill.

The history of Sumatra petroleum is almost word for word the same

as that of Java coffee.

When oil was first found, companies were hastily formed, one or two Americans hired to show them how to work, and an extraordinary period of high salaries, high dividends, and high talk set in. The dividends in some cases were considerably over 100 per cent, and every cent of profit was at once paid out to stockholders, without an idea of

forming a reserve for the future boring of new wells.

Now that the old wells are beginning to give out, there is no money to bore new wells and the companies, notably the "Mocara Enim" (see my report, Consular Reports, No. 214, July, 1898, p. 380), are threatened with forfeiture of their concessions if they borrow foreign capital or employ foreign help, and that in spite of the fact that no others but Americans are capable of doing the necessary work. The Government is watching the Dutch companies being slowly ruined, sooner than abandon what it considers its patriotic policy.

How long this will last remains to be seen, but there is much influence and capital on the side of the oil companies, and it looks as if their arguments must eventually have some effect on the Government.

In any case, I think it is safe to say that we shall see American capital in Sumatra and Borneo very soon, and a new era of prosperity and progress will open for Dutch India.

There is undoubtedly a large extent of unexplored oil land in Sumatra, Borneo, and Java, and in progressive and enlightened hands, the results

would be remarkable.

The importation of American oil for 1897 was 68,063,305 liters (17,968,713 gallons), as against 61,721,213 liters (16,294,400 gallons) in 1896.

The importation of Russian oil for 1897 was 24,310,926 liters (6,418,084 gallons) as against 25,136,787 liters (6,636,112 gallons) for 1896, showing an increase of 6,342,092 liters (1,674,313 gallons) for the American oil, and a decrease of 825,861 liters (218,028 gallons) for Russian oil. There was exported in 1897 a total of 163,529,196 liters (43,171,708 gallons) of Netherlands-India petroleum (practically all from Sumatra) as against 48,712,638 liters (12,860,136 gallons) in 1896, an increase for the year of 114,816,558 liters (30,311,572 gallons). It is pretty well understood that this year will show a great falling off in the exportation of Sumatra oil, owing to the giving out of many of the wells.

The Standard Oil Company is still struggling for the supremacy of the oil market in the East, and is reported to have been doing business at a loss, in order to control the prices by breaking down opposition. Hitherto their efforts have been looked upon as hopeless, but if the wells in Sumatra continue to give out, and the Dutch Government insists on its present policy, the success of the Standard Oil Company is certain, as the Russian oil will soon cease to be a factor. I am watching the situation very closely, and shall report from time to time as new developments arise, as I have done in the past.

#### MINING.

For the last twelve months, the great excitement here has been the boom in mining shares, which was at its height last Christmas, and which, while it lasted, caused a large amount of money to change hands.

It started by a few discoveries of gold in Celebes, at or near a town called Gorontalo, on the north coast of that island. Without stopping to inquire about the nature of the country and the conditions that would have to be faced, everyone joined in a general rush for concessions, and when these were obtained, formed companies and sold stock in Batavia and Amsterdam at enormous premiums. Such proportions did the craze attain that I know actually of cases where stock of new companies was selling at a big premium before the concession had been obtained, or the ground properly prospected. Every young

clerk and small employee was dabbling in mining shares.

Finally, it occurred to some one that it might be a good idea to wait and see if there really was any gold in Celebes, and at once the bubble burst, causing great losses. Shares that were selling at hundreds of dollars premium are now almost given away. But it must not be inferred that there is no gold in Celebes, or that large profits may not be made eventually. There undoubtedly is great mineral wealth, but whether it can be extracted with profit is another question. The difficulties to contend with are enormous. The country is the wildest kind of forest and jungle, the clearing of which is terribly expensive. The climate is deadly, all supplies have to be transported from a great distance, and labor is almost impossible to obtain. So it is pretty certain that many of the smaller companies will never get enough money even to break ground. Many companies have not as yet even prospected. Still, the Dutch pretend to be hopeful and claim they will conquer all difficulties.

There are a few American engineers there, under six months' contracts, at large salaries, but it is doubted whether foreigners will be permitted much longer.

By way of encouraging (?) these unfortunate ventures, the Government is now going to impose heavy taxes, which in the event of any of the companies clearing profits, will absorb them completely.

# IMPORTS.

The year 1897 can not be said to be very encouraging for American trade. True, there is a gain in imports of \$228,581 over 1896, but in a large colony like this, that is not much to boast of. While trade here has certain drawbacks, there is a good, steady market for many lines of goods, and Americans are not as enterprising as they should be.

I do not see nearly as many American traveling representatives here as I would like. I want to emphasize the fact that when they do come,

they are invariably successful.

I must repeat the uselessness of sending circulars and catalogues in English, and writing futile letters to me asking me to hand them to reliable firms. People here are very conservative, and it is hard to make them buy a new line of goods in any case; it certainly can not be done by a letter and catalogue. If individual firms can not afford to send a man to make arrangements for business, I would suggest that a number of firms representing different kinds of business combine and

Digitized by GOOGLE

send someone. I am positive, and many here are of my opinion, that

an American showroom would pay handsomely.

I think that there is a good market here for all kinds of canned goods; there has been a gratifying increase in their importation, but there is room for improvement. Machinery should do much better; with the petroleum and mining companies ordering new material all the time, there is a great chance for our machinery. I have done my best to introduce it to one or two of the large companies, but the results are not what they should be, and cheap German machinery is finding a market.

The imports of resin have increased; also of steel rails and materials

for electric railroads and telephones.

In cotton goods, it is a lamentable fact that the imports for 1897 were nil; this in spite of the fact that this is one of the greatest piece-goods markets in the East, and considered one of the best fields for Manchester goods. Where is that proud boast that Fall River mills can undersell the world? Why do we see them shutting down on account of overproduction, when here is a market open to them? The competition would undoubtedly be keen at first, but I am convinced that if Manchester firms can make fortunes here, the same could be done by our people, with care and shrewd business methods. In any case, it would seem worth while to make the attempt.

Importations of American flour, which at one time were quite encouraging, fell off lamentably during 1897, but I understand that this year things are looking better, and that a certain amount is coming in via Hongkong. There is no reason in the world why our flour can not compete with the Hungarian and Australian products, which are no better, if as good, and no cheaper. The only thing is that great care must be taken in shipping to this climate, as the flour turns sour very quickly. In fact, with the greatest precautions, bread in Java is

sour stuff at best.

Our carriages and bicycles should find a steady sale here. A few come in from time to time, but nothing like to the extent they should. The roads here are excellent, and our American buggy would be an ideal vehicle. I have not seen more than two in Batavia, though I understand there are more at the other end of the island, imported by the Lidgerwood Manufacturing Company (an American house) at Scerabaya.

At present, the carriages here are Austrian and German, very heavy and clumsily made, and not always cheap. They do not compare with ours in quality, lightness, or finish, and I feel sure we could undersell

them.

I have recently reported in regard to bicycles, and I will only repeat that there is a good, steady market for a good, medium-grade wheel. One American bicycle concern sent a man here to make arrangements for handling the agency. He had great success, and sold several hundred bicycles before he left Java. He also succeeded in making advantageous financial arrangements, which is the most essential thing here, and which can not be done as satisfactorily by correspondence.

The roads here are good, and in spite of the climate, bicycling is very popular. It is becoming especially so among the Chinese, and among this class, I think, is the greatest hope of a good market for American vheels. But because they happen to be catering to Chinamen, it must not be inferred by our manufacturers that they can palm off any old thing. There are no people more liberal in some ways than

Advance Sheets, No. 253, October 21; Consular Reports, No. 219, December, 1898.

the Chinese, but they must have their money's worth, and are keen to detect any flaw in the quality of an article. They are already inclined to prefer American wheels to English wheels, on account of their light-

ness and superior finish.

There are, I regret to say, some poor American wheels here, which for a time gave our bicycles a bad name; but lately, some of better quality have arrived, and I am in hopes that American wheels will soon supersede the English. There are a lot of wretched German wheels here which find a good sale among the poorer Chinese and half-castes, but as the people have more experience in bicycling, they will learn that cheap wheels do not pay in the long run, especially where it is hard to have them well repaired; this is impossible upcountry.

#### CLOCKS AND WATCHES.

A much better business might be done here in clocks and watches, which should be of a cheap grade, as the market for expensive jewelry is very small. Cheap Waltham and Waterbury watches would have a great success here if properly handled, especially among the Chinese, Arabs, and natives.

#### LIQUORS.

American whisky it is almost useless to send, as no one likes it, the Scotch whisky, in spite of its smoky taste, being preferred.

There is one German firm which imports some rye whisky for the

benefit of the few Americans, but it is not sold to anyone else.

American bottled beer ought to sell well, as the beer sold here is infamous. I have seen some of our beer, but it is not pushed vigorously enough to make it known. Those here who have tasted it like it very much.

There is one firm that has been importing considerable California wine, not, I believe, with very marked success, but this is due to lack of enterprise in pushing and advertising the goods rather than to any other reason. I have tasted the wine, and find it very good; far better and also cheaper than most of the very inferior French claret imported. I think as it comes to be known by the people here, who are incredibly slow and conservative, it will increase in popularity.

#### BAILWAYS.

Another line in which Americans have been very backward is construction work. There have been lately many miles of tramway and electric railroads built and many more projected, and it seems strange that all the contracts should be held by Germans and Dutchmen. There is an electric railroad being built in Batavia, much of the material for which is American, but the contract is in the hands of Dutchmen, and the rails are German. Several more electric railroads will soon be authorized, and it seems to me that American capital ought to be here bidding on the contracts. They would build far quicker than any of the Dutch companies, and in that respect alone, would give satisfaction.

In a general way, I think I have shown that there are many opportunities for American trade which have been hitherto neglected, but which, if followed up intelligently, would yield very satisfactory results.

#### TRANSPORTATION.

Shipping facilities are good, the best and cheapest being via Liver-pool or London, thence direct to Batavia.

I do not recommend shipping via Holland or Singapore, as it is apt to be considerably more expensive on account of the cost of transshipment at those places.

From San Francisco, shipments are made to Hongkong, thence to

Batavia or Serabaya.

The time of transit for goods between New York and Batavia, allow-

ing liberally for transshipment, is about two months.

The best freight line from Liverpool is the Ocean Steamship Company (Blue Funnel Line); from London, the Queensland Royal Mail.

## BANKS, CURRENCY, ETC.

There are numerous banks, both Dutch and English, all of which buy and sell exchange on London and New York at reasonable rates.

There are also many reputable and well-established firms here of every nationality, who are thoroughly to be relied on for business correspondence, although their methods are slow and not at all up to date

from the American standpoint.

The main drawback to trade is the long credits, which are customary; but if a certain line of goods once becomes really popular, and the people must have it, that difficulty can often be very considerably obviated. I know of two instances where American firms, by making a little effort, succeeded in making very satisfactory financial arrangements, and, in any case, they should always try what they can do before condemning this place as impossible to do business with.

European houses make large fortunes here, and there is no reason

why Americans should not.

The currency of Netherlands-India is still the guilder, as in Holland, par value \$0.402 in our gold. It is divided into 100 cents (Dutch). The standard is the single gold one, as in Holland, and with the exception of Japan, this is the only gold-standard country east of Suez, all the others being on a silver basis. No Dutch gold is actually seen in circulation, as all the currency over 2½ guilders is in notes of the Bank of Java, which is the national bank of issue for Netherlands-India; but gold will always be paid out on demand at the bank, in exchange for its notes.

The fractional currency is the same as in Holland down, to and including the half-guilder pieces; below that, the coins are minted especially for Netherlands India, the inscriptions on the face being in Dutch and

on the back in Malay.

On account of the low price of silver, the dollar and guilder are only worth intrinsically half their face value, and hence counterfeiting is carried on to a great extent. The culprits are all Chinamen, who have their headquarters in Singapore. Of late, the custom has possibly been a little less prevalent, but it is still a cause of great loss to the colony. Recently, some of the counterfeit coin has been shipped to Holland.

The chief remedy advocated is to suppress the silver dollars and guilders and replace them by paper, thus leaving only the small fractional currency, which it is worth no one's while to counterfeit. Something must be done soon, as serious losses will result, not only here but

in Holland.

The average rates of exchange are: Holland, about par; England, 12 florins to the pound; France, 210 francs to the 100 guilders; Germany, 59 guilders to the 100 marks; Austria, 99 florins to the 100 guilders; United States, 2.45 guilders to the dollar, gold; Singapore, Hongkong, and Amoy, 1.19 guilders to the Mexican dollar.

#### TARIFF, ETC.

There are no changes in customs or tariff laws or regulations since the reports I sent last year, with the exception of the export duty on sugar having been repealed.

No special marks are needed on goods.

## HARBOR FACILITIES, TAXES, ETC.

Harbor facilities are good, the harbor for Batavia being at Tanjong Priok, 10 miles from here, where ships come right up alongside the wharf.

Docks and warehouses are excellent.

I inclose a statement of shipping for 1897 and 1898, compiled by J. Daendels & Co.

There are no passport regulations here, but everyone coming has to report to the authorities and secure a permit (cost 60 cents) to sojourn or travel in Netherlands-India. It is a mere formality, and never refused.

Commercial travelers are not hindered or taxed in any way, but after a six months' stay, they are liable to military duty in the militia, as everyone else.

Coasting trade and trade between ports here and in Holland is only allowed to ships flying the Dutch flag. The regulations are, in fact, very similar to our own coastwise shipping laws; otherwise there is no discrimination against foreign ships.

#### POSTAL RATES.

The postal rates are: Domestic: Letters, 10 cents Dutch (4 cents) for 15 grams (one-half ounce); papers and books, 2 cents (0.8 cent) for 50 grams (12 ounces). Foreign: Letters, 25 cents (10 cents) for 15 grams (one-half ounce); papers and books, 5 cents (2 cents) for 50 grams (13 ounces).
To the Straits Settlements, 121 cents Dutch (5 cents) for 15 grams

(one-half ounce) for letters).

To Holland, letters, 15 cents (6 cents) for 15 grams. For newspa-

pers, same as foreign.

The Postal Savings Bank, which was started July 1 of this year, and concerning which I reported September 8,1 has been a great success. I have before me the result of the second and third months' operations, and the increase is very marked.

At present, the natives do not use it as much as the half-castes and poorer Europeans, but they are gradually acquiring confidence in it,

and will in time represent the majority of depositors.

#### FINANCES.

The finances of the colony can hardly be said to be in a flourishing condition. The budget of the year shows a deficit of \$13,000,000 guilders

**(\$5,226,000**).

To meet this, it is proposed to increase the excise duty on petroleum These excise duties are at present 80 cents (United States) per hectoliter (26.418 gallons), and 16 cents (United States) per 144 boxes, respectively. Additions to the import duty, if foreign, of 10 cents (United States) per hectoliter and 6 per cent ad valorem, respectively, are made.

Although the amount of the increase has not been decided on, the

<sup>&</sup>lt;sup>1</sup> See Advance Sheets, No. 268, November 8, Consular Reports, No. 219, December, 1898. Digitized by GOOSIC

very suggestion has aroused tremendous opposition, and numerous meetings by the various chambers of commerce in the colony have been held to protest. Inasmuch as there are no votes to be had here, the chances are the Government will ignore the protests, especially as the last attempt to float an Indian loan in Holland was a failure, and the money must be had somehow.

It is also proposed to levy import and export duties in Great-Atjeh on the north coast of Sumatra, and with these two measures, it is hoped the deficit will be bridged. This is, however, very doubtful, especially

if the numerous projected public works are to be carried out.

Railroad construction is proceeding slowly. The Eastern Railroad is being gradually extended along the north coast toward Cheribon, where it will connect with a steam tramway to Samarang and Joana. No one knows when it will be completed. A railroad is also being built westward to Bantam, Serang, and Aujer. It is nominally due to be finished next year, but if it is done two years from now, I shall be surprised.

In enumerating public works, I should also mention the new harbor and docks at Sourabaya. When they are built, Sourabaya will rival

Batavia as a harbor.

As has been the case for the past twenty-five years, the great source of expense which turns surpluses into deficits is the never-ending war in Sumatra. Exasperated by long-continued failure, the Governor-General of India determined last winter to make a master stroke, send as many troops there as possible, and give the various tribes no peace until they surrendered. With that object, an expedition of about 20,000 men, supported by numerous gunboats, disembarked at Pedir on the north coast of Sumatra. The plan was to chase the natives about from one place to another and make their country untenable. The chasing was done all right, but a native can live just as well in one reed hut as another, and when the troops dislodged them, they merely went somewhere else, keeping easily out of the way of the Dutch. After wandering around the country for six months, the Dutch are returning to Batavia. Much of the war was a farce, and I have been told that more than once, when the Dutch were on the verge of some success, mysterious orders came to retreat. There are so many large interests which are making profits out of the war and are desirous of having it continue, that care is taken never to quite complete anything begun, for fear of achieving undesired victory. This is perfectly well known and openly discussed in Batavia, so I am violating no confidence in repeating it.

The Governor-General is earnest and conscientious and sincerely desirous of finishing the war. It is he who insisted on this last expedition, but the army is lukewarm, seeing in it a perpetual chance for

promotion and extra pay.

Tonkheer C. H. A. von der Wijck is still Governor-General, for although his term expires this year, it has been decided to keep him another year, as he has made such a good record.

I inclose a list of American imports into Netherlands-India for 1896

and 1897; also a report from our agent at Macassar.

#### GENERAL.

There are at present three American business offices in Batavia and one in Sourabaya. All are doing very well.

There have only been five American ships off the coast in the last year, two of which were wrecked and another put in in distress. I regret to say that American ships are a byword here for getting wrecked.

Batavia has been unusually healthy this year, there having been very little cholera and not too much fever. Still, as a health resort, it is hardly to be recommended.

SIDNEY B. EVERETT, Consul.

BATAVIA, October 27, 1898.

[Letter from J. Daendels & Co., Batavia, January 1, 1899.]

The total register tonnage amounted to 555,718 tons, being 82,519 tons over the total tonnage loaded in 1897. This rather considerable increase was caused, for the

larger part, by an augmentation of the sugar production in Java.

In the first half year of 1898 it was rather difficult to find employment for sailing vessels, and afterwards less sailing vessels than in former years visited Java, in consequence whereof steamers have carried a larger part of the sugar crop than before, especially in the latter months of the year, when sailing vessels were relatively

The total sailing tonnage in 1898 amounts to 69,450 tons, against 95,516 tons in 1897, showing an augmentation of 26,066 tons.

The total steamers tonnage in 1898 has been 486,268 tons, against 377,683 tons in 1897, showing an increase of 108,585 tons. The greater part of this augmentation

has been loaded with sugar.

The better prospects as to rate of freight that were present at the beginning of 1898, generally speaking, have been fulfilled. Eighteen hundred and ninety-seven closed with figures of 27s. per ton by sailing vessel and 32s. 6d. per ton by steamer for sugar to Europe and United States. The crop was then at an end and nearly wholly shipped, and the first four months of the year were rather dull. A couple of sailing vessels then were obliged to fix at 21s. 3d. per ton, and the steamers' rate was reduced to nominal, 27s.; but when the new crop came into the market the rate went up for steamers to 32s. 6d. per ton and 35s. per ton, and for sailing vessels to 25s. and 27s. 6d. per ton. A small reaction then followed, so that in July and August no more than 31s. 3d. and 32s. 6d. by steamer and 26s. 3d. by sailing vessel was obtainable. In the latter part of August room became scarce and the rate of freight went up to 37s. 6d. by steamers and 30s. by sailing vessels. A couple of sailing vessels were fixed even at 32s. 6d. and at 35s. per ton. The year now has been closed with but little inquiry for room, the rates last paid having been about 32s. 6d. per ton by steamer and 28s. 9d. per ton by sailing vessel.

Prospects for the next sugar crop are very satisfactory, and there is no reason as

yet to expect lower freights, as in 1898.

The reglular liners to the mother country have found regularly good employment, notwithstanding the small coffee crop. The tonnage of this fleet is now increasing regularly, steamers of more capacity taking up the service. The tariff of these steamers remains nearly unaltered.

The Government's coffee crop was very small, but there was still a part of 1897's crop to be shipped. The steamers of the Nederland and Rotterdamsche Lloyd have

carried this cargo.

Private coffee to be shipped by sailing vessel to Holland was not offered. Some four or five small sailing vessels were fixed to load coffee at Batavia and at Padang for New York, at increasing rates, from 32s. 6d. to 40s. per ton. The actual rate for this business is 37s. 6d.

Other cargo by sailing vessel to Holland was very scarce. Only one vessel was laid on the berth, taking arrack at 45 florins per last, and filling up with light freight

at low rates.

Nearly no copra came forward for export, one small steamer was chartered from Padang at 36s. 3d. per ton of 20 hundredweight. Prospects for copra in 1899 are very

good, and it seems that supplies will soon be accumulating.
Shipments of teak timber took place only in small-parcels with the regular liners, whereas one ship was chartered with logs to Channel f. o., and one ship with sleepers to south Africa. It appears that the demand for sleepers in the latter direction is supplied, and has ceased.

Sugar shipments to China have again increased, the rate to Hongkong being gen-

erally about \$0.30 per picul. A few cargoes were shipped to Japan.

Shipments to Australia were very few, the rate rather low, 10s. per ton.

In consequence of the coal strike in England the importation of English coal was small. Australian coal was imported more freely, notwithstanding a rather higher rate of freight, that could maintain itself through the unsettled political conditions in the far East. However, Ombilien coals from Sumatra are making their way steadily to the different consumers and already supply a large part of the different

#### REPORT FROM MACASSAR.

The year can not be called satisfactory, the trade having had to struggle against too many obstacles. Above all, the failure of the rice crop kept down the disposition of the natives to buy, and caused a financial crisis among the Chinese buyers. Besides, the continually declining prices of coffee and gum copal checked the business in many districts.

In consequence of all these impediments, the import business remained about 25 per cent behind that of 1896, and the total value of all imports

was not more than \$2,000,000.

Macassar is a free port, and there are no duties. The imports consist principally of gray, bleached, colored, and printed cotton goods and gray and dyed yarns, chiefly from England, the Netherlands, and Switzerland. United States manufactures have not yet appeared in this market, though American manufacturers could certainly sell gray drills 22 by 31 yards as cheap as Holland, and gray T-cloths, gray shirtings, etc., at the same rates as England.

Business between Manchester and the firms in this archipelago is done, as a rule, through representatives in London, Amsterdam, and Hamburg, who are perfectly acquainted with all descriptions of Manchester goods, and always exactly informed of the slightest fluctuations of value. This is, of course, an immense advantage for English manufacturers over those in the United States who are not represented at

the aforesaid ports.

Macassar is of no importance for ironmongery, and there would be competition with German goods of inferior quality, which seem to satisfy the people. There is no sale at all for engines and machinery.

Coffee exports.—As to the quantity, the crop was rather good. There arrived from Celebes about 40,000 piculs (1 picul = 136 pounds) of Patioe (from Bouthain and Sindjai), Boongi, and Loohoo, and from Timor about 16,000 piculs, which was mostly sold to New York, while the Celebes

coffee was shipped to Amsterdam and Havre.

Gum copal.—Notwithstanding the fact that exports to Singapore, the Netherlands, and London reached about 4,800 tons, the final result was bad, in consequence of the perpetually falling prices, and American traders appear to have bought more largely in London and Amsterdam, where the auctions inflicted heavy losses to the consignors here.

Copra.—The dearth has proved prejudicial to the crop, and there arrived 4,200 tons, against 8,700 tons in 1896. Prices fluctuated between \$38.40 and \$48 a ton, with a decided upward tendency at the end of

the year, supplies generally going to Marseilles and Singapore.

Spices remained depressed all the year. For years, Macassar has ceased to be the center for spices, because the firms in the Moluccas thought to do better by shipping direct to Singapore and Holland. In consequence, there were only shipped from this port—

100	18.
Cloves	20
Mace	
Nutmegs 2	

Birds of paradise came regularly. Prices gave way considerably during the first half year, but afterwards, remained firm. Exports were to France, London, and Amsterdam, and there were shipped from

Macassar about \$75,000 and from Ternate \$100,000 worth.

Shells remained in good demand. Aros mother-of-pearl shells brought \$650 to \$700 a ton; Timor and Ceram, \$380 to \$480; exports were chiefly to Havre. Flores shells were much in demand for Hamburg, London, Amsterdam, and Trieste, and obtained the uncommonly high prices of \$250 to \$325 a ton.

It is surprising that, for a long time, no shells have been sent to the United States. Probably American importers prefer taking chances in

the auctions in Europe.

Exports of mother-of-pearl shells were 200 tons, and of other shells 150 tons.

The amount of pearls found is estimated at \$15,000 to \$20,000 worth. Trade in other important articles remained steady, and there were forwarded, chiefly to Amsterdam and Singapore:

Cassia		
Hides	do	475
Rattan	do	2,500
Tortoise shells	do	31
Horns		<b>\$7</b> , 500
Kajuputi oil		<b>\$3</b> 0, 000

Till now the United States, with the exception of coffee, participates very little in the export trade of this place. The direct export to the United States in 1897 was only—

Cloves \$1,930.24	,
Coffee	
Gum copal 33, 183, 34	
Kajuputi oil	1
Nutmegs	

Digitized by GOOGIC

In the three previous years the totals were-

1896	\$201, 409.07
1895	518, 812. 76
1894	413, 426. 92

Direct imports from the United States consisted of one cargo of Devoe's refined oil, viz, 47,275 cases, or 472,750 gallons, per English bark Strathisla.

Besides the above direct supply, there have been landed here, per steamers from Java, 43,306 cases of two 5-gallon tins, all Devoe's oil; no other kind is liked here.

#### ARRIVALS OF VESSELS.

The tonnage of sailing vessels, in the last four years, has been-

•	Tons.
1897	10.047
1896	10, 913
1895	11, 947
1894	15 964
10v2	-0,00-

This was divided among the different flags as follows-

Flag.	1897.	1896.	1895.
Amadan	Tons.	Tons. 1, 453	Tons.
American Danish Dutch English French German	1, 050 5, 647 2, 790	1, 426 805 8, 028 554 1, 042	4, 404 983 3, 448
talian Norwegian Swedish	560	2, 605	1, 90 56
Total	10, 047	10, 913	11, 94

The tonnage of steamers, on the other hand, shows an increase, as follows:

	Tons.
1897	154, 690
1896	
1895	
1894	

Flag.	1897.	1896.	1895.
Dutch	15, 567	Tons. 97, 718 42, 440	Tone. 96, 951 88, 974 953 201
Total	154, 690	140, 158	187, 079

The increase in German tonnage was due to the steamer *Stettin*, which calls at this port on voyages from German New Guinea to Singapore, and this tonnage will increase further this year, because the steamer also calls on outward voyages.

The German steamer Michael Yebson, chartered by the Royal Dutch Steam Navigation Company, made several trips from Koetei (Borneo) to this harbor with coal.

K. AUER, Consular Agent.

\ MACASSAR, September 15, 1898.

#### DECLARED EXPORTS. DUTCH EAST INDIES.

Value of exports declared for the United States at the several consulates and agencies in Dutch India, during the year ended June 30, 1898.

#### JAPAN.

## REPORT FROM CONSULATE-GENERAL AT YOKOHAMA.

I transmit tables showing the foreign trade of Japan during the year ending December 31, 1897.

In these tables, the Japanese silver yen has been taken as equivalent to 50 cents, United States gold, such being its mean value during said year.

JOHN F. GOWEY, Consul General.

Yоконама, June 27, 1898.

#### Total foreign trade of Japan, by countries, during the year 1897.

NOTE.—These figures relate to the open ports only. Statistics of other ports and of Japanese vessels exclusively engaged in the coasting trade are not given in the customs returns. The Japanese vessels here referred to are those employed in foreign trade.

#### COTTON GOODS IN JAPAN.

In compliance with the final paragraph of the Department's circular of August 5, 1898, I have to report that, aside from cotton duck, the imports of cotton textiles into Japan from the United States are very limited. A small quantity of the finer grades of American shirtings finds a steady but not encouragingly increasing sale. The following statistics of imports into Japan during the year 1897 will afford further details:

Shirtings:

It is now an admitted fact that American raw cotton is making great headway in Japan as against the Indian product, and the reason given to me by well-informed parties engaged in the trade, is that the former is a much superior article and has been extraordinarily cheap of late. Taking American middling and Indian broach growths into consideration, it will pay the mill owner in Japan to use the American staple, even if it be dearer than Indian by a yen a picul (49 cents per 133 pounds). As a matter of fact, these two have, during the past year and a half, been frequently quoted at very nearly the same prices, and recently the Indian staple has been quoted higher. It may, therefore, be reasonably expected that during the current season, American raw cotton will lead the market as against Indian.

These remarks do not apply to inferior Indian growths, or what are known as fair and medium stapled cottons. These are indispensable in producing the coarser counts, from 16's downward, and will continue to be bought as heretofore, the average count turned out by the Japanese mills being 16's. It is in the 20's and higher counts only that the American cotton will replace Indian cotton. Even here, the mills are said to be very cautious. Of yarns spun at present, at least 80 per cent are taken up by consumers in the interior for home weaving. A great deal of this has to be dyed, and it is alleged that the yarn produced from American cotton, though stronger and whiter, does not take the dye easily. Whether the fault lies in the yarn or in the dyeing process, my informant is unable to say.

A merchant here who has had much experience in this trade says:

As to cheap Indian labor, I am afraid there is not much in this argument. Labor may be called cheap in India if the result of an Indian laborer's work bears a higher proportion to his wages than that of an American, but I do not think this is quite the case. Where the American laborer gets a dollar, the Indian hardly gets a few

cents, but, owing to the extensive scale on which agriculture is conducted in America and the scientific knowledge and appliances brought to bear on it, the result is rather in favor of America. Cotton and wheat show this beyond doubt. Of course, when comparing the prices of these staples, the quality should also be borne in mind. Not only will American cotton come to be imported more largely in future in

Japan, but also in China, and even in India.

If the American farmers are able for any length of time to produce cotton that can be sold in Liverpool under 3d. (6 cents) per pound, as it is likely to be this year, the time may not be distant when American cotton will prove a very serious rival to the Indian in its own home. Every effort is made in the United States to increase the average outturn per acre while lessening the cost, and the result has been so far satisfactory that one may well count on American being obtainable during coming years at from 3d. to 34d. On the other hand, present prices are all but ruinous to the Indian producer, so that the contingency I mention above is by no means an impossible one.

Raw cotton imported into Japan during the year 1897 amounted to 306,485,892 pounds, valued at \$21,810,107, of which 46,364,897 pounds came from the United States, with a value of \$3,636,611. British India supplied 180,285,020 pounds, valued at \$12,865,189. China supplied 68,427,611 pounds, valued at \$4,817,988.

In conclusion, I may say that among American firms here it is not believed that a large business can be done in Japan in our cotton tex-

tiles, aside from cotton duck and other coarse fabrics.

JOHN F. GOWEY, Consul-General.

YOKOHAMA, November 11, 1898.

#### POSTAL AND TELEGRAPH SERVICE OF JAPAN.

Consul-General Gowey writes from Yokohama, December 30, 1898: The inclosed clipping, giving certain statistics relative to the postal and telegraphic service of Japan during the year 1897, is taken from this morning's Japan Times, and contains, I believe, reliable information.

The value of the yen therein mentioned may be taken as 50 cents.

#### POSTS AND TELEGRAPHS.

The department of communications has just published very useful compendiums of statistics relating to posts and telegraphs during the year 1897. First, with regard to the postal business, we find the following general summary:

#### General summary of postal business in Japan (Formosa excluded) in 1897.

Post-offices and branches       4, 288         Places for the sale of stamps and cards       36, 119         Post boxes       37, 156         Officials and employees       83, 857         Postal routes       59, 875         Postal package routes       26, 879         Mail matters carried       550, 906, 484

The important a position excepted by Keres in matters of postal communication, is The importance of the presence of a large and increasing Japanese population is by activity and increasing Japanese population the increasing presence of a large and increasing Japanese population is included within the increasing present control within the increasing present control and a second present control and the second present control and the following table:

## Pemeric mency-order service.

`				
You.	('tribers Money	Increase over pre- vises year.	Year.	Orders   Increase
	Fra. 12 50M 539 14 552 651 17, 135, 289 36, 171, 669 35, 672, 653	17.7	1895 1895 1895 1897	Fen. Per cant. 23, 560, 744 12, 6 24, 1013, 446 19, 1 45, 109, 461 15, 25, 259, 461 15, 25

It should be observed that the discrepancy between the figures for 1897 in the above table, and those for the same year as given in the general summary mentioned before, is explained by the fact that Formosa is excluded in the latter case, whereas it is included in the former. The same remark applies to a similar discrepancy in the case of the volume of mail matter already dealt with.

The depositors at the postal savings in 1897 are classified according to occupation,

as follows:

1	Per ce	ent.
Agriculturists		39
Merchants		16
Manufacturers		7
Miscellaneous business		6
Workingmen		5
Officials		5

Fishermen and sailors		ĭ
Without occupation		î
Temples shrines and other corporate bodies		2
Temples, shrines, and other corporate bodies		12
Overpressed and many many many many many many many many		
Total		100

The postal savings service does not show any noteworthy growth during the ten years from 1888 to 1897, the figures for the respective years being 20,100,000 yen and 25,700 yen. The tardy development of this service is easily accounted for by the enormous increase in recent years of banking facilities, offering very tempting rates

for private depositors.

The comparative figures about the expenditure and receipts in connection with

the postal business during the ten years ending 1897, are as given below:

Year.	Receipts.	Expendi- tures.	Balance.
1888	Yen. 2, 502, 416 2, 954, 364 3, 102, 911 3, 669, 772 3, 778, 008 4, 425, 547 5, 186, 957 5, 820, 679 6, 772, 644 7, 689, 313	Ten. 1, 948, 977 2, 263, 990 2, 800, 666 3, 067, 019 3, 259, 568 3, 362, 215 3, 662, 939 4, 072, 779 5, 039, 654 5, 953, 850	Yen. 553, 439 680, 374 302, 245 602, 753 518, 440 1, 664, 332 1, 524, 018 1, 747, 900 1, 622, 990 1, 730, 463

Turning to the telegraph service, its condition in 1897 is summarized as follows:

Routes	14, 327
RoutesLines	46, 746
Offices	1, 259
Messages forwarded	14, 136, 012
Messages delivered	14, 379, 606
Ordinary receipts	b 4, 286, 299
Ordinary receipts	b 3, 173, 756
Profit	b 1, 112, 543

For sake of simplicity we may indicate the development of the telegraph service during the ten years ending 1897 by the average number of messages per 1,000 of population for the respective years:

388	70
389	87
390	102
391	111
92	127
93	151

#### OSAKA AND HIOGO.

The same rapid degree of commercial development as that which had previously existed at this port, may be noted during the last calendar year.

Included in this consular district are the two large cities of Osaka and Kobe (Hiogo), the large and increasing population of which repre-

sent their steady advance in commerce and industry.

The stimulus given by this growth has brought to labor of all kinds largely increased compensation. The population of Osaka has now reached to 758,385, and that of Kobe (Hiogo) to 202,912, the same being an increase of 56 per cent and 32 per cent, respectively, during the last five years. It should, however, be noted that about one-half of the five years' increase in Osaka is due to the recent extension of its municipal limits.

Importations and exportations take place at Kobe (Hiogo), while the city of Osaka ranks as the largest manufacturing center of Japan.

The following table is given, in order to show the declared values of several of the larger foreign imports and exports which passed through this port during the last year.

#### IMPORTS.

		•	
Raw cotton		Steam vessels	\$1,004,765
Rice	7, 479, 938	Various machinery	968, <b>6</b> 44
Sngar	3, 688, 203	Railroad iron	895, 675
Beans and pease	2, 326, 013	Bar and rod iron	<b>625,</b> 016
Spinning machinery and	,,	Railway materials	518, 080
parts of	<b>2</b> , 011, 932	Locomotives, and parts of	523, 324
Cotton yarns	1, 917, 472	Mousseline de laine	1, 387, 665
Kerosene oil	1, 679, 245	Gray shirtings	678, 362
Bean cakes	1, 100, 936	Cotton satins	659, 777
	EXP	ORTS.	
Cotton yarn	\$5, 950, 379	Camphor	\$649,558
			1, 222, 017
Matches	2, 754, 172	Cotton piece goods	
Rice	2, 136, 942	Porcelain and earthen ware	575, 565
Matting	1, 578, 905	Hemp and cotton rugs	473, 477
Copper ingots, slabs, and		Fans	434, 925
manufactures	1, 535, 623	Silk piece goods	277, 990
Tea	1, 292, 489	Silk waste	267, 640
Straw braid	987, 342		,

The total annual imports at this port for the year under review were \$57,317,854, and the total exports \$26,165,067, there having been an excess of importations valued at \$31,152,786. The excess of importations for the last year show an increase over the one immediately preceding, of more than \$7,000,000.

#### NEW HARBOR AT OSAKA.

During the last year, work has been slowly progressing upon the projected harbor at Osaka. It is contemplated that the entire cost of this great work when finished will amount to more than \$7,000,000, about one-third of which will be contributed by the Government during the eight years supposed to be necessary for its completion.

A very large proportion of the manufactured articles shipped from this port is made in Osaka, and it is thought by some that the new harbor when finished may detract from the importance of Kobe as a shipping point. Others, however, hold that the present shipping interests

of the latter city will hardly be interfered with to any serious extent, as there are such large vested interests at this point, and for the further reason that Kobe is reenforced by territory more fertile in material resources than that contiguous to Osaka. It is thought that there may be a division of some of the new shipping interests of the future, but that the present business now so firmly intrenched here will remain. In confirmation of this theory, it is pointed out that the Government has just completed an extensive pier in Kobe, called the American Hatoba, a camber, and several large custom-house godowns, with a view to largely increasing export business at that point.

#### INDUSTRIES IN OSAKA.

The industries of Osaka are becoming considerably diversified. Iron and machine works and cotton spinning mills are most numerous. The following is a detailed list of the factories and mills using steam power:

Spinning mills         15         Copper smelting works           Iron and machine works         19         Paper mills           Clock factories         3         Oil refineries           Wooden pipe works         5         Woolen mills           Dyeing establishments         5         Glass works           Cement works         3         Shipyards	3 4 2 4 3
Brush works 3 Miscellaneous 2	

Outside of the city of Osaka, in this consular district, there are 5,924 factories, employing 30,086 male and 28,709 female operatives. The average daily wage of the former is  $24\frac{1}{2}$  sen (12 cents), and of the latter  $14\frac{1}{6}$  sen (7 cents) per individual. The Japanese are a very imitative people, and can easily copy originals, which fact indicates that further progress will soon be made by them in manufacturing.

## GENERAL ADVANCE IN PRICES.

During the last year, everything has been greatly advancing in price. The cost of living has been materially enhanced, rents are much higher, merchandise of Japanese production is all held at higher figures, taxation and postal rates have increased, and labor of all kinds has been much better remunerated.

This condition of affairs commenced immediately after the conclusion of the war with China, which doubtless gave a great stimulus to business in Japan; but it is thought that this is a period of inflation, and that a reaction must necessarily soon follow.

#### THE KOBE WATERWORKS.

The need of a proper supply of pure and wholesome water has been

very severely felt in Kobe, ever since the opening of the port.

The increasing rate of the population led to the formation, about three years since, of a company for the building of an extensive waterworks plant, to furnish the city of Kobe (Hiogo) with a supply sufficient for a population of 250,000 inhabitants, the same to be conducted from a healthful source and stored in two large reservoirs with a capacity of 9,000,000 cubic feet.

This work was commenced in August of last year, and it is expected that it will be fully completed by January, 1899, at a total cost of \$1,638,420, to be provided for by a bonded indebtedness of \$1,110,540, together with a subsidy by the Japanese Government of \$458,160, and one by Kobe-shi of \$69,720. Iron tubes of twelvedimensions will be used, from 4 to 24 inches in diameter, the whole reaching a distance equal to

Digitized by GOOGIC

104 miles in length. The supply will also be sufficient for fire and all other purposes. Considered apart from its general utility, the completion of this work will be hailed as a great sanitary measure, calculated to largely promote the health of the port.

#### BUSINESS METHODS.

Nothing serves better to illustrate the progressive spirit of the Japanese than their great anxiety for the introduction of foreign capital for business purposes. The efforts in this direction by the business classes are strongly supplemented by the vernacular press, and by the Japanese chambers of commerce in Kobe and elsewhere.

The foreign and Japanese chambers of commerce lately held an informal joint meeting in relation to this subject, at which time it was plainly pointed out by the foreign chamber that the capital sought, being necessarily timid, required to be properly safeguarded by a more liberal display upon the part of the Government, such as, for instance, the equalization of foreigners with Japanese in regard to the holding of

shares in stock companies and the ownership of land.

Japanese business people are slow, methodical, and cautious in their dealings, and it is characteristic of them to protect themselves at every point. Business must be done carefully with them, as well as with others. Their responsibility must be thoroughly investigated, and also their general business reputation. There are mercantile agencies in this country which furnish financial ratings, and some of the representative Japanese houses have branches in one or more of the leading American cities.

It may be noted that there has, of late, been considerable complaint that goods have not been promptly taken upon arrival, and this is said to be part of a scheme by some to finally obtain them at a lower rate. The only way to do business successfully with this class would be to require the deposit of a sum sufficient to reimburse the shipper in such cases. It has largely become the practice for even reputable Japanese merchants to not only put up margins upon orders, but to fully secure the payment of large invoices upon delivery of bill of lading.

There is a peculiarity about the Japanese that does not attach to any other people, and it is this: The average Japanese are very suspicious of small wares that are not backed up with fancy trade-marks. They buy goods much more readily that carry a device or an emblem, or that bear a seal, and many a good article would be in danger of rejection

because not put up fancifully.

They also attach importance to small, neat packages, not too many of a kind together; this is more in keeping with Japanese tastes. In America, small articles are put up and sold by the dozen; the Japanese want them separate, not only because things here are generally on a smaller scale, but for financial reasons. Their means are limited, and

they use everything sparingly.

It is probably true that the German exporter understands the native taste better than any other. The markets here are full of small wares from Germany, put up in attractive style and in small quantities to find ready sale. Another point in favor of German exporters is the fact that they do not confine themselves to the quick and ready methods of others, but stay upon the ground until they get the trade. It would be well for Americans to note a little more closely the fact that the markets of the East can not be obtained entirely by wide-awake methods, but that much patient and persistent effort is required.

The following exhibit gives the value of the foreign trade of Osaka

and Hiogo (Kobe) with the United States for the year 1897, in comparison with that of 1896:

	1897.	1896.
ImportsExports	\$6, 764, 450. 10 4, 218, 408. 58	\$4, 521, 629. 66 3, 942, 015. 51
Excess of imports	2, 546, 041. 52	579, 614. 15

The above table shows an increase of 49.6 per cent in imports from the United States, during the last year.

Principal imports from and exports to the United States for the year 1897, compared with those of 1896.

#### SUPERIORITY OF AMERICAN GOODS.

The Japanese have no prejudice against American goods or manufactures; on the contrary, their superiority is freely admitted in many lines. As an illustration, there was recently made at Tokyo, by the authorities of the locomotive department, a critical test of English and American locomotives, and it resulted in favor of those made in America. The American locomotives were pronounced superior in all respects, and it was especially noted that they worked more economically. Tests

1896

have also been made of American machinery and many other manufactures from our country, and in regard to their quality, the results have proved most satisfactory. The chief difficulty in the way of the greater introduction here of American goods, lies in the fact that our merchants and manufacturers are not putting forth the same degree of effort for the Japanese markets as exporters from other foreign countries.

#### SENDING CIRCULARS AND PRICE LISTS.

Too much of this is done to the exclusion of personal effort. The hotel reading rooms and private offices are stocked with mail matter from all parts. In the United States, circulars and price lists alone may produce some result, but they will avail but little 9,000 or 10,000 miles away from home, unless followed up by salesmen. One firm might deluge the market with trade literature for years, and another could send an energetic man along and pick up all the business. It might be well to pave the way by advertising, but in order to insure sales, the man must be upon the ground; he must be intelligent and persistent, and his firm should bear in mind that this market is not worked any more easily than are the overworked markets at home.

#### CARE IN PACKING GOODS.

For the better protection of shippers' interests, it may be said that much more care should be taken by them in packing their goods for this market. Several well-founded complaints have recently been made in this respect concerning American goods, and while it is true that the same fault attaches to other foreign shippers, that fact is not of much value to American exporters. As one instance of many that have lately been brought to the attention of this consulate, it may be mentioned that one of our leading American houses here recently received from New York an invoice of seven metal fireplaces, for immediate delivery. They were fine specimens and just what would have suited, but when received, they were all found to be in a badly broken condition, caused simply by being improperly packed.

Such cases as these not only entail considerable loss upon shippers, but they destroy the prospect of future orders. In connection with this subject, attention should be called to several recent shipments of American cotton, claimed by the consignees to be not up to standard. Four cases of this kind have occurred at this port within the last four months. Upon application at the consulate, surveyors were appointed to inspect the cotton and to extract samples from each bale, in order that they might be forwarded under the consular seal to cotton experts in

America for examination as to value.

This not only entails loss to the shipper, but, in the estimation of some here, it tends to lower the high standard of American cotton, which export is by far the most valuable one from the United States to this port.

#### COMMERCE.

The volume of the foreign trade of Osaka and Hiogo (Kobe) for the year 1897 contrasts with that of 1896 as follows:

[Values in United States gold.]

	1897.	
nnorte	\$57 317 854 21	94
portaporta	26, 165, 067. 39	2

 sports
 \$57, 317, 854. 21
 \$45, 929, 709. 97

 xports
 26, 165, 067. 39
 21, 476, 911. 37

 Excess of imports
 31, 152, 786. 82
 24, 452, 798. 60

The excess of imports in 1897 over those of 1896 is \$6,699,988.

The trade of the year 1897 was distributed among foreign countries as follows:

Country.	Exports.	Imports.
Hongkong	\$7, 669, 713, 74	\$2, 571, 698. 95
China	7, 103, 673. 14	8, 871, 229, 57

~*****		
Total	21, 476, 911, 87	45, 929, 709, 97

It may be seen by the foregoing tables that outside of Hongkong and China, the United States is by far Japan's best customer. This fact is appreciated by Japanese producers. It may also be noted that the

United States sold here last year only 50 per cent more than she bought of Japan, while England, standing highest in that respect among European countries, shipped here seven times as much in value as she took away. There is no valid reason why this should be the case.

#### TRADE OF JAPAN WITH THE UNITED STATES.

In the year ending December 31 last, the United States exceeded all other countries in exports to and imports from Japan of the commodities named in the following tables. The declared values of the same are stated, together with those of the chief competitors for this foreign trade:

Exports from foreign countries to Japan.

a All other countries, \$30.

#### BAILWAY LOCOMOTIVES.

England started the railway system of Japan, and was thus given a natural precedence in the railway development of the country; but, as may be seen by the foregoing table, she has not maintained her lead. The United States has proved its ability during the last three years to compete with and outdistance its great rival. In 1895, England exported locomotives to Japan valued at \$380,935, against \$142,165 worth from the United States. This year, exportations of locomotives to this country stand thus: Great Britain, \$899,129; United States, \$1,191,905.

This is a field of industry which has been properly worked, and in which the superior merits of American locomotives have been recog-

nized, or no such results could have been obtained.

#### RAILROAD IRON.

The contest for supplying Japan lies between England and the United States, and it is likely that it will continue. In 1895, Great Britain furnished nearly all the railroad iron imported into this country, a very small quantity having been exported from Belgium and Germany; the United States supplied none. In 1896, the United States exported only a little more than one sixth as much of railroad iron to this country as England did, but in 1897, a very notable increase took place from the United States in such shipments, and exportations from the two countries stood thus: Great Britain, \$810,110; United States, \$615,018.

At this rate, another year will show the United States to have left its competitor in this export far behind.

#### IRON, BAR AND ROD, PLATE, SHEET, AND PIG.

During 1895-96, the United States exported none of the above-named manufactures to Japan. The following table, however, shows our country to have been one of the principal exporters in this line in 1897:

Country.	Iron, bar and rod.	Iron, plate and sheet.	Pig iron.
Great Britain United States Germany Belgium	66, 893 145, 278	\$493, 655 622 22, 884 68, 066	\$397, 155 29, 312 38, 383

#### IRON NAILS, BOLTS, AND SCREWS.

In 1895, the United States exported to Japan but \$33 worth of iron bolts and screws and \$2,521 worth of iron nails, against which we exported last year, iron bolts and screws valued at \$5,262, and iron nails valued at \$469,689. Germany was the largest shipper of nails to Japan in 1896, sending an amount equal to \$469,485, against \$116,160 worth from the United States; but last year, as shown by a preceding table, these two countries changed places, the United States having shipped a large amount, while Germany dropped to less than one-half her former export.

#### COTTON-SPINNING MACHINERY.

The United States does not materially help to supply the vast quantity of spinning machinery required in Japan. This field is one in which England seems to have always had a monopoly. Her exports here of such machinery during the last year amounted to \$2,632,509, against \$4,557 worth from the United States, and but little from any other country.

This state of affairs should be looked into carefully by enterprising American manufacturers of machinery, as cotton spinning in Japan is rapidly on the increase, involving a brisk demand for equipment.

Japanese agencies for the purchase of spinning machinery are established in New York. Osaka is the chief cotton spinning and weaving district, and manufactures immense quantities of cotton cloth, not only for home use, but for export to China, Korea, and Hongkong.

#### PAPER-MAKING MACHINERY.

The United States slightly leads in this export. Nearly all of it comes from there and England. In 1896, our country shipped paper-making machinery into Japan valued at \$65,466, against shipments of the same from England of \$24,796. During the year under review, exports stood: United States, \$197,000; England, \$175,032. These latter figures show a largely increased demand for this machinery, and it should be noted that the exports from the two countries named are now nearly balanced. Large paper mills are established in this consular district.

#### DYNAMO ELECTRIC MACHINERY.

The United States is well ahead in this export and should strive to maintain its lead, as there is no doubt that with the opening up of Japan consequent upon the operation of the new treaties in 1899, the demand for this machinery will be greatly stimulated, as will also be the case with many other foreign inventions and productions.

The following table names the principal countries exporting this machinery, and the value exported from each, during the last three years:

Country.	1895.	1896.	1897.
United States.	86, 854	\$148, 143	\$341, 154
Great Britain.		131, 306	92, 161
Germany		80, 643	82, 095

#### MINING MACHINERY.

This is used for the mining of coal, silver, copper, sulphur, and antimony. The imports were:

Country.	1896.	1897.
Great Britain United States Germany	12, 533	\$119, 231 31, 250 7, 860

#### FLOUR.

Flour is a growing import into this country, and the United States supplies most of it, a very small quantity being shipped from British America and China. The United States more than doubled its export of flour to Japan in 1896; but during the last year, the exports of this article gained only about 17 per cent, in consequence of its enhanced value at home, cheapness being an indispensable condition to ready sale in this country. When the price of flour in the United States again becomes normal, it will no doubt soon be much more extensively exported to this country.

#### RAW COTTON.

Since 1895, British India has gained largely in the exportation of raw cotton to Japan, having more than trebled its shipments in three

years, while China has fallen behind about 50 per cent.

The United States gained more than 80 per cent in 1896 over the preceding year, and more than 70 per cent in the year under review. In commenting on the increased import here of American cotton, the annual report of the foreign chamber of commerce at Kobé states that from October to December last, 120,000 bales were contracted for, and that, in consequence, spinners would, in the near future, be using 40 per cent of American cotton against 12 to 15 per cent in former years. It was also stated in the report that the working of American cotton both reduced the running expenses of the mills and increased their capacity to turn out the finished product.

#### SHIPPING.

The following tables show the shipping at Hiogo (Kobé) of the several countries named for the year 1897, in comparison with that of the year 1896:

Merchant vessels entered from and cleared for foreign countries during the year 1897.

#### EXPORT OF MATTING AND RUGS.

There was a large falling off in the exportation of mattings from this port to the United States during the last half of the year, consequent upon the operation of the duty on that article.

As is always the rule in such cases, exdortations were greatly stimu-

lated immediately previous to the date when the duty took effect, and

greatly diminished immediately thereafter.

During the six months ending December 31, 1896, there were exported from here to the United States 199,400 rolls, against 90,499 rolls during the corresponding time in 1897, there being a deficiency of 108,901 rolls during the six months immediately following the operation of the tariff.

During the first six months of 1897 a large portion of the matting exported was of the better and best grades; but on account of the rate of 4 cents per yard and 25 per cent ad valorem additional upon grades above 10 cents per yard, shipments since the imposition of duty have been confined principally to the grades not exceeding 10 cents per yard.

The exportation of rugs has been affected in the same manner. During the six months ending December 31, 1896, when the duty on Japanese rugs was but 20 per cent, 3,894 bales were exported to the United States from this port, against 1,335 bales during the corresponding period of 1897, during which time the duty was 50 per cent.

As to the difference in the quantity of matting exported during corresponding periods in 1896-97, a small portion of it may be attributed to extraordinary shipments in anticipation of duty, but there is

no doubt that the shrinkage is mainly due to the duty imposed.

It should, however, be stated that the lessened exportation of rugs is probably caused as much by deterioration of quality as by the increased duty. An examination of the customs returns shows that the decreased export of rugs to the United States has been counterbalanced by their increased export to Great Britain.

#### GENERAL.

The tables and general remarks contained in this report applying to the whole of Japan, have been submitted in consequence of this being the great central port of the Empire, through which a large proportion of the imports thus tabled must necessarily pass.

Attention is especially called to the fact that there are a great many lesser imports from the United States not officially tabulated by the customs authorities, and it is fair to assume that they comprise initial shipments of various articles of merchandise which, if followed up by proper effort, may be found profitable to the exporters.

In conclusion, I would add that commercial conditions at this port should attract the careful attention of American producers whose lines

correspond with the trade wants of Japan.

SAMUEL S. LYON, Consul.

H10G0, July 6, 1898.

#### SUPPLEMENTARY REPORT.

An examination of commercial conditions at this port during the six months ended June 30, 1898, shows an increased import and export business, compared with the corresponding period of the preceding year.

The half year under review shows, however, that this port has gained but little in exportations, the increased aggregate of foreign trade being due to excessive importations, these having been 57 per cent larger than during the first six months of last year.

It should be stated that the heavier importations have been too large for the demands of trade, as in certain lines of merchandise, it became necessary to store large quantities in warehouses, the Japanese purchasers being unable to take delivery in consequence of the stringency

of the money market. It should also be noted that among the excessive importations held back for payment, are large quantities of

American pig iron and raw cotton.

The stagnation in monetary affairs has probably been augmented by the recent change from a silver to a gold basis, but it is generally anticipated that the beneficial results arising from a stable currency will tend to soon bring about a period of greater prosperity in this country than has yet been known.

The following are official tables of imports and exports at and from this port during the first half of this year, compared with those for the

first half of last year, showing the increase referred to, viz:

	1	898.	1	897.	Increase.		
	Yen.	United States equivalent.	Yen.	United States equivalent.	Yen.	United States equivalent.	
Imports Exports	82, 896, 476 27, 385, 012	\$41, 282, 445 13, 637, 751	52, 750, 693 26, 661, 032	\$26, 269, 845 13, 277, 194	30, 145, 782 724, 010	\$15, 012, 600 360, 557	
Excess of imports.	55, 511, 433	27, 644, 694	26, 089, 660	12, 992, 651	29, 421, 772	14, 652, 042	
Aggregate foreign trade	110, 281, 518	54, 920, 196	79, 411, 725	39, 547, 039	30, 869, 793	15, 373, 157	

The foregoing table also shows the excess of imports during the first six months of 1898 to be more than double the excess of the corre-

sponding period of 1897.

The following is a table showing the value and increase of certain exports from the United States to this port, in which it either leads all other countries or exports largely; also, its principal competitors in such exports, the same being shown for the first six months each of 1897–98:

The United States during the first half of 1898, as compared with all other countries, stood second at this port in exports and third in imports. During the corresponding period last year, its exports, compared with all other countries, ranked third and its imports third.

In consideration of the fact that until lately, comparatively few American producers have seriously contested for Japanese markets, it is very gratifying to note the present remarkable increase of exports from the United States.

It is no doubt due to a variety of causes other than the increased

Digitized by Google

activity of our exporters, among which may be mentioned the recognition by the Japanese people of the superior merits of American products and manufactures, coupled with their friendly commercial spirit toward our country. Due credit should also be given to mercantile associations in the United States formed for the purpose of pioneering American trade in the East.

During the last year, both the Philadelphia Commercial Museum and the American Exporters' Association have sent to Japan active and

able representatives to help open the way for our commerce.

Mr. C. A. Green, who represented the Philadelphia Museum, was most warmly received by both the native and foreign chambers of commerce at this port, before which bodies, upon invitation, he delivered addresses which attracted the close attention of native and foreign merchants. Newspaper interviews were printed in both English and Japanese journals explaining the object of the museum and scope of its work, and it may be said that general interest in American commercial matters was awakened by the visit of the representatives.

The organized efforts put forth by these associations and by others of like character can not fail in their object, if properly utilized by our

exporters.

Another and an important cause for the increased importation of American goods has been the higher duties about to be imposed; but it is fair to presume that the imports from all other countries have also been stimulated by them. Therefore, the ratio of each country's export is a correct one, as shown by the accompanying tables.

The value of United States trade with this port during the first half of 1897 and of 1898 is stated in the tables below, which show an increase this year of a little over 50 per cent in imports and a decrease of about

1 per cent in exports.

Digitized by GOOGIC

The foregoing table shows that in even figures, 45,000,000 pounds more of raw cotton came to this port during the first half of 1898 than during the corresponding period of 1897. Exportations of this commodity from China are shown to have fallen off 13,000,000 pounds, and India, the only real competitor of our country at present, is shown to have gained but 6,500,000 pounds, while the phenomenal gain of 51,000,000 pounds has been made by the United States.

The great falling off in importation from China is largely caused by the recent establishment of factories in that country, which use their own product, and an explanation of the lack of greater increase from India is found in the fact that there is a growing demand in Japan for

the better grades of goods, which require American cotton.

#### AMERICAN DRY GOODS.

I think it would be well for some of our American manufacturers of calico prints to make a trial of their goods in this market. I have been here about one year, and so far, have not seen a yard of American

calico offered for sale in this port.

The Japanese manufacture an imitation of our prints, but a very poor one, said to be not durable in color, and, as to texture, not nearly so strong, while the cost of manufacture is somewhat higher. The Japanese women generally wear kimonos made from a rather heavier material than printed calico, but during the summer months, a lighter weight would be preferable, because not so warm. Dark blue is the favorite color of both sexes. The indigo blue calicoes made in the United States, if introduced in Japan, would no doubt find a market, as would also the various shades of silver grays so much worn here. Plain colors would perhaps be most sought, but it is likely that a demand could soon be created, also, for printed calicoes in both dark and light colors. Cheapness is the great desideratum in this country, and there does not seem to be anything here which in price or quality could prevent the introduction of American calicoes. There is not much doubt that cheap grades of fast-colored American lawns and challies could also be introduced at this port.

American manufacturers of ordinary mosquito nettings should also look into this market. There are mills in Paterson, N. J., manufacturing a certain low-priced grade which no doubt could quickly displace the so-called mosquito nettings manufactured in this country. Those made here closely resemble what in America is termed cheese cloth or thin bunting. They are narrow, and consequently it is necessary to sew the breadths together. Besides, they cost more than twice as

much per yard.

Mosquito nettings made in our country exclude the mosquito and admit the air, while Japanese nettings exclude both air and mosquito. That insect is far more numerous here than in most localities in the United States, and its bite is more poisonous; hence, there is an almost universal demand for netting. It may be said that during about four months of the year, everybody in this portion of the Empire is compelled to sleep under mosquito netting.

#### INDUSTRIAL CONDITIONS.

As to the industrial interests of this district, it may be said they are in their usual condition, which is one of moderate advance. In manufacturing towns and cities, there is a steady demand for improved machinery and for many modern manufactures, and there is also an increased adaptation to improved methods generally.

The Japanese are continually having more wants to supply, and in many lines are themselves becoming more able to supply them, but there is a large field here in which to introduce many of the superior

productions of our country.

Consuls in Japan frequently have applications made to them for information looking to the introduction of farming implements. Japanese farmers are very much behind in regard to farming tools, only those of primitive origin being used. The farmers are wide-awake enough in cultivating the land; there are no vacant lots or stretches of pasture land up to the very edge of the city. Although they use no labor-saving machinery, the soil is well tilled, but tilled by the hardest, all hand work. Large hoes are used for shovels, men's shoulders for wheelbarrows, and a cow is utilized in place of a horse, hitched to a wooden instead of an iron plow.

The greatest obstacle to the introduction of labor-saving machinery in Japan for farming purposes is the low price paid for farm labor. Greatly improved methods in tilling the soil will not be introduced until wages materially advance, and perhaps not even then, unless labor-saving

machinery is shown on Japanese farms by foreigners.

The Japanese farmers live in villages, and their land lies around the villages. In traveling by rail, one passes through large cultivated tracts looking like well-kept gardens, without a house in sight, when suddenly a little cluster of neat farmhouses will appear in view. There is no class of the population more industrious and thrifty than the Japanese farmers.

## TEA TRADE.

There was much concern in Japan when, in June last, the United States Government placed a war tax of 10 cents per pound upon the importation of teas. That feeling was manifested by the tea interests to such an extent, that the Kobe and Yokohama native chambers of commerce forwarded to our Government a protest against the imposition of the duty, with a view to at least secure its modification. This apprehension was a very natural one, as nearly all Japanese teas had previously gone to the United States, and it was feared that the tax, together with the effects of the war then existing in our country, might exclude a large percentage of the tea crop. Whatever the cause, since the tariff went into operation, the statistics of shipment show a remarkably large decrease.

The commercial bureau in the foreign office instituted an inquiry among the Yokohama Tea Guild, after four months' operation of the American tariff on teas, as to the effect it had in Japan. The reply of the guild was that during that time the export of teas from the port of Yokohama and Kobe had shown a decrease of 3,000,000 kin (4,000,000).

pounds).

Shipments of tea were very greatly stimulated immediately before the imposition of the duty, as evidenced by the fact that in the first six months of 1898, during the last one of which the duty took effect, fully 70 per cent more in value of teas were sent to the United States than during the corresponding period of 1897. The brisk demand engendered before the duty went into effect, together with the rise in values of other principal commodities, forced prices up to from 2 yen (99 cents) to 3 yen (\$1.49) per picul, and they have been well maintained even since the operation of the duty.

The tea crop was not as closely picked this year as formerly, in consequence of growers anticipating a much lessened demand, for the rea-

Digitized by Google

son stated. When teas advanced, prices went relatively higher on the lower grades, they being most in demand, as the duty, added to the value of the higher priced teas, placed them beyond popular use.

As to this year's quality, it may be considered barely an average one. The inferior teas exported this year have been shipped to Canada and Korea, in consequence of their rejection by the United States standard. The best qualities of Japan teas are grown in Yamashiro, near Kioto.

#### MATTINGS UNDER UNITED STATES TARIFF.

The American tariff upon mattings, which went into effect last year, does not seem to have greatly diminished the gross value of that export to our country. There would probably have been as much in value exported during the first half of 1898 as during the first half of 1897, were it not that exports were stimulated throughout the first six months of 1897 by the anticipated tariff. As regards the quality of matting sent to our country, there is no doubt that the duty, being partly specific, has the effect of largely excluding the finer grades, upon which the tariff is relatively higher.

Since January 1 last, there has been a steady demand for all kinds of matting costing not more than 10 cents per yard, as the duty on this class of matting is less in proportion. The better grades have not been

much in request.

In regard to the present assessment of duty upon mattings, it is applied in such manner that the difference in quality of even 1 cent per yard, while hardly perceptible, carries an enhanced specific duty of 4 cents per yard, besides an ad valorem one of 25 per cent. It is therefore apparent that, in order to obtain the difference in quality of but 1 cent per yard above the 10-cent grade, the duty is increased 63 cents per yard—that is to say, a matting costing 10 cents with duty added is increased to but 13 cents, while one costing 11 cents with duty added is increased to 203 cents.

It is claimed by Japanese producers of matting that the present combination of a specific and an ad valorem duty upon their product discriminates against them, and in favor of mattings made in China; that the great bulk of Chinese mattings are of the lower grades, which escape the higher proportioned duty, and that China is not prepared to make the finer qualities which Japan is capable of producing but can not dispose of to our country under the present arrangements.

Considering the disproportioned tariff, it is probably true, as claimed by the manufacturers, that in order to encourage the production of the better grades of matting for export to the United States, it will be necessary to change the present specific duty on low qualities and the combination duty upon better ones, to an ad valorem rate upon all.

The following named countries and dependencies are the principal ones importing matting from this port; they purchased here during the first half of 1898, the values shown in the following table:

Country.	Yen.	United States equivalent.
United States. Great Britain. Hongkong. British India Australia	80, 144 16, 237	\$808, 884 15, 012 8, 086 6, 832 5, 732

#### CAMPHOR AND CAMPHOR TREES.

A considerable quantity of camphor in its refined state is exported from this port. The value shipped during the first half of 1898 nearly trebled the shipments during the first half of 1897. There are several refineries in Kobe, operated almost exclusively by foreigners. The value of camphor shipped from this port during the first six months of 1897 was \$34,033. During the six months ended June 30, 1898, the value exported was \$93,656.

I have gathered, from an official source, certain facts in connection with the propagation of the camphor tree in Japan and in Formosa,

which I submit in the following synopsis:

Camphor forests have been replanted by the Japanese Government during the last five years in the prefectures of Oita, Kagoshima, Miyasaki, and Kochi. Trees producing the best quality of camphor are grown in the prefectures named above. Camphor forests grow spontaneously in level ground and on the sides of mountains facing south. In planting camphor trees, the slow slope of a mountain not high above the sea level is selected.

In Formosa, where the climate is a warmer one, camphor trees grow best on mountains facing north, as the temperature of the southern slopes is too high, camphor trees requiring a certain kind of climate. The trees thrive best on mountains at an altitude of 3,000 to 5,000 feet above sea level, and produce the largest percentage of camphor at 5,000 feet.

Dry soil is best for camphor trees; they will not grow in moist

ground. Trees of four to six years' growth are the best.

During the reign of the feudal lords, camphor trees grew spontaneously in many of the warmer localities in Japan, and the cutting of them was prohibited by edict. Since the restoration, however, the forests have been greatly decimated and but gradually replanted. The largest export of camphor from Japan, during the last twelve years, was in 1890, the amount exported that year being valued at nearly \$10,000,000. The amount exported during the last year was \$649,558. This port by far exceeds all others in Japan, in its exportations of camphor.

#### NEW TARIFF RATES.

The new Japanese conventional and statutory tariffs¹ will be enforced from the 1st day of January, 1899. This is a matter of considerable importance to importers here, as it will necessarily rearrange many lines of merchandise. The present duties have existed so long and are so light that the full effect of the new tariff rates, materially advancing the cost of numerous articles in Japan, will be watched with interest.

In shipping goods to the Japanese markets, exporters should take into consideration not only the fact that large stocks are stored in godowns, on account of the Japanese merchants' inability to take delivery, but that in addition, heavy importations have taken place in anticipation of the new tariff rates.

The duty upon certain of the principal imports from the United States will be changed, on January 1, 1899, from the existing rates to higher

ones, both of which are tabled below.

<sup>&</sup>lt;sup>1</sup>See Consular Reports, No. 204, September, 1897, and Advance Sheets, No. 360, Feb. 27, 1899.

# Abstract of Japanese tariff.

		New tariff.			
Article.	Present tariff.	Statutory.	British conventional.		
Sole leather :	0. 63 yen (\$0. 313) per picul (1331 pounds).	7.441 yen (\$3.705) per 100 catties.	5. 69 yen (\$2.833) per 100 catties.		
Pig iron	0. 047 yen(\$0.023) per picul (1331 pounds).	5 per cent	0.083 yen (\$0.041) per 100 catties.		
Canvas	0. 078 yen(\$0. 038) per 10 yards.	0.071 yen (\$0.035) per square yard.			
Iron nails	0.094 yen(\$0.046) per picul (1331 pounds).	10 per cent	0.573 yen (\$0 285) per 100 catties.		
Iron screws	0.094 yen(\$0.046) per picul (1331 pounds).	10 per cent	10 per cent.		
Tobacco	5 per cent	0.444 yen (\$0.221) per catty.a			
Watches: Gold and platinum		30 per cent.			
Mechanism of watches or parts of	5 per cent	15 per cent. 10 per cent.			
Printing machinery Loconotives Condensed milk	5 per cent		0.123 yen (\$0.063)		
Animal bones.	-	(\$0.184) per dosen weight.	per dozen 1- pound tins.		
Rails and railway materials	5 per cent	5 per cent	0.129 yen (\$0.064) per 100 catties.		
Paraffin wax	5 per cent	(0,016 yen	0.544 yen (\$0.27) per 100 catties.		
Kerosene oil	5 per cent	(\$0.079) per gallon in tin. 0.016 yen (\$0.079) per			
Cigarettes	5 per cent	gallon in cask. 1,153 yen per 1000.			
Wood, planks, etc	5 per cent	5 per cent. 7.628 yen (\$0.574) per			
Flour	Free	100 cubic feet. 0.465 yen (\$0.231) per			
Raw cotton	Free	100 catties. Free.			

a The catty mentioned in this tariff is the Japanese weight. It is equal to 600 grams of the metric system of weight, or 1.32277 pounds English avoirdupois weight. The square yard is the English Imperial surfac emeasure.

# SUGAR REFINING IN OSAKA.

Among the many manufactories in Osaka is the recently added sugar refinery, operated by the Japan Sugar Refining Company, Limited. The main buildings and plant are very heavily constructed, in order to protect the latter from seismic disturbances. The raw material for refining is brought principally from Formosa, Manila, and Java.

Nine centrifugal machines are used, driven at 9,000 periphery feet per minute. The boiler equipment is said to be the largest in Japan, there being eight boilers, each 8 feet in diameter and 30 feet in length, with two economizers working in conjunction. The works were constructed by an English firm, and are capable of turning out 70 tons of refined sugar per day. There is but one other sugar refinery in Japan, and that is situated in Tokyo.

The new Japanese tariff will be in the line of protection to home industries, and favorable to sugar refining in this country, there being an advanced duty of but 26 sen (13 cents) per picul on raw sugar, while there is an increase of 64 sen (32 cents) per picul on the refined product.

#### NEW HARBOR REGULATIONS.

Although this port has been open during the last thirty years, and the bay has so long been filled with shipping of all kinds, it has never

been governed by specific harbor regulations.

A foreigner had been employed as harbor master, but as he had no rules to ask the consuls' enforcement of, he was generally compelled to arrange any difficulties which might arise between himself and masters of vessels in such way as could be mutually agreed upon.

Japanese harbor regulations have now, however, been promulgated for the various open ports of the Empire, and they will take effect at

this port on the 1st of November, 1898.

The regulations which will then come into operation are similar in character to those enforced at equally important points elsewhere, and until the coming into effect of the new treaties, the consuls of the several countries will be expected to cooperate in their enforcement.

#### IBON NAILS.

United States exporters last year gained the nail market of this port from Germany, and during the six months ended June 30, 1898, have reduced the shipments of that country to a minimum.

The following table shows the export here from each country, during

the first six months of 1897-98:

	18	97.	18	98.	Increa	se, 18 <b>9</b> 8.	Decrease, 1898.	
Country.	Yen.	United States equiva- lent.	Yen.	United States equiva- lent.	Yen.	United States equiva- lent.	Yen.	United States equiva- lent.
Germany United States	230, 208 65, 853	\$114, 644 82, 795	17, 207 143, 927	\$8, 569 71, 676	78, 074	<b>\$38, 881</b>	218, 001	\$106, 073

It may be seen from the above tables, however, that the combined exports of nails from both countries, during the period stated in 1898, are 45 per cent less than in the corresponding time in 1897.

#### RAILS AND RAILWAY MATERIAL.

In 1896, the United States sent to Japan only one-sixth as much in value of rails and railway materials as came from England. In 1897, we shipped three-fourths as much, and during the period under review of this year, we have sent to this port four-fifths as much of those products as came from England.

It will be observed that the combined value of such exports from the two countries named, during the first half of this year, fall 31 per cent below the combined value of the corresponding period of last year. This falling off may be wholly attributed to the financial stringency

<sup>&</sup>lt;sup>1</sup>See Advance Sheets No. 197, August 19, 1899, Consular Reports No. 217, October, 1898.

now prevailing in Japan. There are more railways projected here, awaiting a better financial condition of the country, than ever before. When conditions are favorable, these projects will be as fully carried out as is possible with such resources as this country can command, and should foreign capitalists become satisfied with the operation of the new treaties coming into effect next July, it is probable that the enterprise of railroad building will be given a greatly added impetus by the influx of foreign capital.

#### LOCOMOTIVES.

The United States, having such vast railroad systems, necessitating the most perfect equipment, is the country naturally looked to for locomotives of the highest standard. American locomotives have been critically tested by Japanese Government experts, and their superiority has been well acknowledged by the large purchases of them by this country during the last calendar year, and by the lead they have maintained at this port and probably at the other open ports of the Empire during the six months under review. During the last calendar year, the United States sent locomotives to Japan valued at \$1,191,905, against \$899,129 worth from England. During the last calendar year, such exportation from the United States to this port only, amounted to \$305,831.

Importations of locomotives at this port from the United States in the first six months of 1896 were \$14,453; in 1897, \$95,109; and in 1898, \$144,293.

#### PIG IRON.

Although Great Britain is the chief country in the exportation of pig iron to this port, and has nearly doubled her shipments of that article here during the first six months of 1898, as compared with the corresponding period of 1897, it may be said that the United States has also become a considerable shipper here of that product, and that it has gained rapidly during the time specified, having increased such shipments to more than ten times their former value.

The export here of pig iron from our country is light in comparison with that of Great Britain, but it may be considered large, taken in connection with the fact that our exporters did not enter this field with

that article until last year.

It has been stated in this report that a considerable quantity of pig iron is now being held in warehouses at this port awaiting delivery, but, as noted, that is only in consequence of the temporary stringency of the money market, which it is probable will soon pass away.

This country is in but a semiexpanded state, and it will continue to largely import crude materials for its further growth in manufactures.

The table below gives the value and increase of pig iron shipped

from the countries named:

	18	97.	18	98.	Increase.		
Country.	Yen.	United States equiva- ient.	Yen.	United States equiva- lent.	Yen.	United States equiva- lent.	
Great Britain United States Germany	211, 808 9, 310	\$105, 480 4, 686	409, 214 93, 410 36, 630	\$203, 789 46, 518 18, 242	197, 408 84, 100	\$98, 309 41, 882	

## SOLE LEATHER.

Attention is particularly called to the remarkably large increase at this port, during the first six months of this year, in the exportation by the United States of sole leather, the value of such export having been more than six times greater than during the corresponding period of last year. Our country does not meet with much competition here in this article. The only competitors classified in the customs returns for the first six months of last year were East India and France; they each shipped, during the time, about \$1,600 worth. The first six months of this year show France to have sent none, while East India has increased her export of that article to \$13,000.

Each year, the Japanese people wear more shoes and are having more uses for leather of all kinds. The close attention of leather producers in the United States is called to this fact, and to the additional one that the supply must come from abroad, as, on account of the scarcity of cattle in this country, the Japanese people can not supply themselves.

The following table shows the exportation of sole leather from the United States to this port during the years 1896 and 1897, and for the first six months each of 1897 and 1898:

Year.	Yen.	United States equivalent.
1896	153, 702 108, 768 19, 872 128, 838	\$76, 544 54, 166 9, 896 64, 161

## SHIPPING.

The following tables show the shipping interests at Hiogo (Kobe) of the several countries named for the period of 1898, under review, as compared with the corresponding period of last year:

Merchant vessels entered from and cleared for foreign countries January 1 to June 30, 1898.

The figures in the following paragraph are taken from consular records:

For the first six months of this year, there entered this port 13 American steamers with a tonnage of 34,051, and 5 American sailing vessels with a tonnage of 11,325, aggregating 18 vessels with a tonnage of 45,376, as against 13 American steamers with a tonnage of 34,905, and 10 American sailing vessels with a tonnage of 11,325, aggregating 23 vessels with a tonnage of 46,230, for the corresponding period of last year. From this, it will be seen that there has been a slight decrease in the tonnage of the entering steamers, while the tonnage of sailing vessels remains the same.

For the same period, there cleared from this port 13 American steamers with a tonnage of 34,051, and 5 American sailing vessels with a tonnage of 9,833, aggregating 18 vessels with a tonnage of 43,884, as against 13 American steamers with a tonnage of 34,905, and 9 American sailing vessels with a tonnage of 9,642, aggregating 22 vessels with a tonnage of 44,367 in 1897. From this it will be seen that there has been a slight decrease in the tonnage of steamers cleared and a slight increase in the tonnage of sailing vessels cleared during the first six months of this year.

There were 70 merchant vessels that cleared from this port with general cargoes, for ports in the United States, during the first six months of this year, viz, 41 British, 12 American, 8 Japanese, 4 German, 3 Norwegian, and 2 Hawaiian. For the corresponding period of last year, there were 59 vessels, viz, 42 British, 11 American, and 6 Japanese.

From the figures for the period of 1898, under review, it is seen that the cargo shipped from this port to the United States was carried in the bottoms of 59 per cent British, 17 per cent American, 11 per cent Japanese, 6 per cent German, 4 per cent Norwegian, and 3 per cent Hawaiian vessels.

#### TRANSPORTATION.

The following table gives the number and tonnage of vessels plying between this port and the United States:

		1897.

The largely increased balance of trade in favor of the United States at Hiogo for the last half year will doubtless prove a most satisfactory exhibit to our exporters, and encourage them to still greater effort in expanding American trade at this port.

SAMUEL S. LYON, Consul.

H10G0, October 31, 1898.

## NEW TRANSPORTATION FACILITIES.

A new trans Pacific line of steamers, to be operated by the recently formed "California and Oriental Steamship Company," will be put into operation in December next.

These steamers will run in connection with the Atchison, Topeka,

and Santa Fe Railroad system in the United States.

The terminal points will be Hongkong, China, and San Diego, Cal. The new line of steamers will ply at regular intervals, and call at intermediate ports, including Yokohama, Hiogo, and Honolulu.

Three steamers have been chartered for this line for three years.

They are the Belgian King, 3,379 tons; the Carlisle City, 3,002 tons,

and the Carmarthenshire, 2,929 tons.

The commerce of the United States with the far East is expanding rapidly, as shown by the continually increasing facilities for transportation from the Pacific coast.

JAMES S. LYON, Consul.

H10Go, November 17, 1898.

#### NAGASAKI.1

The total imports into this consular district (exclusive of Formosa) of all foreign goods for the period under consideration, were valued at 10,273,635 yen (\$5,116,270), an increase of 41½ per cent over the same period in 1897. The principal articles were sugar, raw cotton, tobacco, kerosene oil, iron (both pig and manufactured), fertilizers, and flour. The value of imports from the United States was 1,565,106 yen (\$779,423), and the principal articles were locomotive engines (and parts thereof), raw cotton, pig and manufactured iron, kerosene oil, salted meats, wheat flour, and lubricating oil.

The total exports from this consular district (exclusive of Formosa) during the same period, amounted to 2,712,946 yen (\$1,351,047), an increase of less than 4 per cent over the same months of 1897. The principal articles were rice, coal, and coke. Rice to the value of 289,019 yen and a small amount of matting, curios, and household effects

went to the United States.

Special paragraphs, hereinafter submitted, will give fairly exact information as to the increase or decrease in the more important lines of exports and imports, especially such as enter into the trade of the United States.

The advantages and labor-saving qualities of American machines and apparatus of all kinds, and the greater durability of certain lines of goods, are admitted to a certain extent in this district, but attention is

asked to the comments submitted upon special details.

Whenever an article of American manufacture has secured the favor of Japanese tradesmen, there is no reason for its not continuing to monopolize the market (for the sentiment of the people is strongly in our behalf), provided the standard of quality be fully maintained, and an equal amount of care and attention be paid to the appearance of the packages and to the methods of shipping that are given to such matters by European manufacturers. There is a preference on the part of most foreigners and of many Japanese for glass jars for all fruits, vegetables, etc., rather than tin cans, when the former are practicable. Whatever is put upon the glass in the nature of label or advertisement should be so heavily varnished or shellacked or prepared in some other way as to permit of its being washed without marring the beauty or clearness of the label; while cans should be provided with labels other than those of thin paper, which do not allow the can to be washed and have its appearance restored when it becomes fly specked or shopworn. The methods adopted by most of the French purveyors are In the matter of packing, it is very desirable that the recommended. initial jar or tin be as small as practicable—for example, butter in halfpound cans, fruit and vegetables in half-pound cans or pint jars; while cases of such size as can be carried conveniently by a porter along rough mountain roads, will find a much readier sale with the Japanese than the large cases containing two dozen 2-pound cans. In the one item of biscuits (crackers), it is believed that the American bakers are gradually supplanting the European, and there is no apparent reason why our merchants should not secure a monopoly of this business, provided the standard be fully maintained. The present size of the tin boxes used rather checks the sale to the Japanese, and it is probable that tins of half the size would sell much more readily. Besides the matter of cost, there is an additional reason for the preference for small tins, in that the biscuits soon lose their crispness in this moist climate.

In textiles, machinery, implements, and all other articles, it is equally important that the standard of excellence originally established when first soliciting orders be rigidly maintained, and also that the requirements of the Japanese dealers and consumers be carefully ascertained and fully complied with. These may at times seem to be somewhat whimsical, in that they differ so widely from established custom in the United States (for example, as to the width of a piece of cloth, the length of the bolt, the number of pieces in a bale, the dimensions of a package, or the size of a case of machinery); but it will always be found that there is good reason for these requirements, either in the meagerness of the demand or the inadequate transportation facilities. Our competitors carefully study these peculiarities.

There is no complaint that European or English houses give longer credit than American houses. The importing and jobbing firms here buy for cash. It is, I believe, admitted by our American houses in Japan that they labor under some disadvantage from there being no American bankers with ample capital in the far East. It would seem that there were an opening in Japan for a purely American bank, since the volume of trade between the United States and this country is of dimensions sufficient to keep a large amount of bank capital actively

and profitably employed.

#### CHANGES IN CURRENCY VALUES.

Since Japan adopted the gold standard, October 1, 1897, there have been very slight changes, the United States value of the Japanese yen being from 49 to 50 cents. Rates of exchange no longer fluctuate as they did when Japan was a silver country. Formerly, it was not uncommon to see rates rise or fall 1 or 2 per cent in a single day, and even much more, during panics. To-day, the rate of exchange varies by perhaps one-eighth of 1 per cent, often remaining constant for weeks together at some fraction between 48\frac{3}{4} and 49\frac{1}{4}, the lowest and highest rates for bank demand drafts on the United States from January 1 to June 30, 1898. In lessening uncertainty as to the cost here of an imported article, this establishment of a permanent rate of exchange has had a most salutary effect upon trade.

#### CHANGES IN TARIFF RATES AND CUSTOMS RULES.

Important changes in existing import rates will go into effect January 1, 1899, when the present tariff, with a maximum rate of 5 per cent ad valorem, is replaced by one ranging from duty free to 40 per cent, averaging nearly 15 per cent. The highest duty is levied upon alcohol, wines, spirits, and tobacco.¹ There is, besides this ad valorem schedule, a long list of articles upon which specfic duties will be levied.

#### PORT REGULATIONS.

Amended harbor regulations<sup>2</sup> go into effect at this port from the 1st of November, when for the first time in Nagasaki since antetreaty days, there will be a harbor master and assistants. With the rapidly increasing number of steamers coming here for passengers, cargo, or coal, this will be a useful precaution, tending to mitigate the danger of

<sup>&</sup>lt;sup>1</sup>See Consular Reports, No. 204, September, 1897, p. 91.

<sup>&</sup>lt;sup>2</sup>See Advance Sheets, No. 197, August 19; Consular Reports, No. 217, October, 1898. See also Supplementary Report for Nagasaki.

overcrowding the long, narrow harbor. Beyond this innovation, there are no radical changes in the regulations for shipping.

#### HARBOR FACILITIES.

Work is being slowly prosecuted upon the improvements in Nagasaki harbor, but it will probably take several years to finish them as projected. The plan is quite extensive, contemplating the reclamation of a considerable area, the construction of piers for steamers, and the deepening of the upper part of the harbor.

#### TELEGRAPH AND CABLE SERVICE.

Excepting the development of the internal system of the imperial Japanese post and telegraph department, there has been no extension of this service. A cable south from Formosa, giving an alternate route to Hongkong, and possibly a direct cable from Formosa to the Philippines are contemplated; the latter will certainly be laid as soon as the trans-Pacific cable is in operation.

#### TRANSPORTATION FACILITIES.

Internal transportation is by railway, cargo boats, porters, and pack animals; coastwise, by junks and steamers; foreign, by numerous lines of ocean steamers. Existing facilities are ample. The new arrangement of mail steamers from Hongkong to San Francisco, stopping from twelve to twenty-four hours at Nagasaki, goes into full effect the middle of December. It is a joint schedule of the Pacific mail (American), Occi dental and Oriental (British), and Oriental (Japanese) steamship companies. The Japanese vessels are new, built in Great Britain expressly for this line. The time from here to San Francisco via Kobe, Yokohama, and Honolulu, is twenty-two to twenty-three days. By connection with steamers to Kobe, there are lines to Tacoma (Northern Pacific) in twenty-two days, and to Seattle (Japan Mail Steamship Company) in the same time.

By the 1st of November, it is expected that the Kyushu Railway will be completed to Moji on the Strait of Shimonoseki, at the western entrance to the Inland Sea of Japan, enabling passengers and freight to go through from Nagasaki without change. Connection is made with a branch line to Kumamoto, and this branch will eventually be carried through to Kagoshima, the capital of the province of Satsuma, in the southern part of the island of Kyushu. This development will materially benefit the trade of Nagasaki; but for traveling will probably not be patronized largely by foreigners. At the Strait of Shimonoseki it is proposed to equip a ferry for transporting an entire train. The width of the strait is half a mile, and at Bakan, on the north side, connection will be made with the Sanyo Railway, by which passengers may go through to Kobe, Yokohama, and Tokyo, and at different points connect with the extensive system of the main island. It is the present intention to build a bridge across the Strait of Shimonoseki, which will be one of the wonders of the railway world.

#### LICENSES, ETC.

Commercial transactions between foreigners and Japanese, by the terms of existing treaties, must be conducted on the foreign concession at one of the treaty (open) ports, Yokohama, Kobe, Osaka, Nagasaki,

Hakodate, and Niigata; Tokyo being tacitly included in the list of open ports. It is true that the strict letter of the treaties is sometimes evaded, but this is dangerous. There are no inducements for houses in the United States to send representatives to Japan to solicit the trade of retail dealers throughout this country. There are several large American firms in this consular district that stand ready to invest in any American manufactures and to push their sale among the Japanese, if they can see any profit in it. It might be advisable for commercial travelers from the United States to visit these firms, which are The China and Japan Trading Company, Limited; R. H. Powers & Co.; and Edward Lake.

There are no regulations affecting commercial travelers, nor is any license fee exacted from them or from the resident firms. Commercial travelers are free to come and go at the open ports, where they may solicit trade as they please, and to travel in the interior with passports (which are readily procurable through their consuls) for "scientific research" or in the "pursuit of health," but not for purposes of trade. After July 17, 1899, when the revised treaties become operative, the restrictions upon trade, travel, and residence will be removed, and the entire country will be open to citizens and to subjects of treaty powers.

#### MERCHANT MARINE.

A gradual improvement continues in the Japanese service, in which small native built and manned steamers are taking the place of coasting junks. The Japanese are extending their foreign lines, and now have, in addition to the long established lines to Asiatic ports, regular lines to India, Europe, Australia, and Seattle. In December, a Japanese company unites with the Pacific Mail and Occidental and Oriental companies in maintaining the regular service between Hongkong and San Francisco via Shanghai, Nagasaki, Kobe, Yokohama, and Honolulu, at ten days' intervals. The facilities afforded by other lines of mail and of cargo steamers, under various foreign flags, remain unchanged and are ample.

Two steamers have been launched at the Nagasaki Dockyard and Engine Works—one a freight vessel, the other a 6,000-ton passenger and cargo steamer—fully equipped with all modern improvements, for the European line above mentioned. The materials for these two steamers are said to have been imported from England. These works have since launched a 3,000-ton steamer and have several others under construction, including a duplicate of the 6,000 ton vessel mentioned above, also intended for the Japan Mail Steamship Company's European line.

During the six months ending June 30, 1898, there were entered at the port of Nagasaki from foreign countries 73 Japanese steamers, 93,220 tons; 274 foreign steamers, 509,452 tons; 19 Japanese sailing vessels (including junks), 417 tons; 20 foreign sailing vessels, 12,552 tons. Total, 347 steamers, 602,672 tons; 39 sailing vessels, 12,969 tons. Cleared for foreign countries, 70 Japanese steamers, 81,917 tons; 204 foreign steamers, 333,699 tons; 6 Japanese sailing vessels (including junks), 213 tons; 21 foreign sailing vessels, 13,822 tons. Total, 274 steamers, 415,616 tons; 27 sailing vessels, 14,035 tons.

The Japanese Government is very liberal in granting subsidies, especially to Japanese foreign-going lines. No foreign flag is permitted to engage in a strictly coastwise trade; foreign steamers may carry passengers and cargo between intermediate Japanese ports, provided the destination is a foreign port. Foreign bottoms may, under special

Digitized by Google

arrangements, be chartered by Japanese to go coastwise and to load or to discharge cargo at certain nontreaty or quasi-open ports. It is probable that, under the revised treaties, to become operative July 17, 1899, further restrictions, tending to protect the Japanese merchant marine, will be adopted.

#### QUARANTINE.

There has been no change in the regulations at this port, but the existing ones are rigidly enforced. All vessels coming from ports where the plague or other infectious or contagious disease is prevalent, are thoroughly inspected and communication with the shore is forbidden until needful precautions are taken.

# GENERAL LAWS AND REGULATIONS.

There are no laws or regulations of a discriminating character which affect American vessels. There are no taxes or excises in addition to customs tariff. The only changes in patent, copyright, and trade-mark laws are in the direction of greater liberality in registering and protecting foreign trade-marks. Patent rights on foreign articles are not yet satisfactorily adjusted, as Japan has not joined the international union.

Existing postal rates are 2 sen (1 cent, United States) per quarter ounce (about) for domestic first-class matter. For foreign mails, the rules of the International Postal Union obtain, 10 sen (5 cents, United States) per 15 grams per one-half ounce for first-class matter. Japan has very satisfactory arrangements for "parcels post" with several countries of Europe and with the Dominion of Canada. A similar arrangement with the United States would be a great convenience to American merchants trading with Japan.

I am not aware of the existence of any law requiring goods to be marked to show the country of origin or manufacture; but, as a matter of fact, the custom has become so nearly universal and seems to be so very desirable, that most of the goods imported into this district are so marked as to indicate plainly the country of origin; and on all really first-class goods, the name of the manufacturer, either firm or mill, is given.

# ARTICLES OF IMPORT.

Of the principal articles which enter into the trade of Nagasaki, it seems sufficient to make particular mention of the following:

Furniture.—Excepting some special pieces of more or less elegance imported by foreigners for their own use, the limited demand for wooden furniture is well supplied by Japanese and China cabinetmakers; but for iron, iron and brass bedsteads, and woven-wire springs, there is a growing demand, which ought to be supplied entirely by our manufacturers. It is not worth while, however, for the manufacturers to send a special agent here to solicit trade.

Watches.—The Japanese market was formerly supplied in large part by American makers, but the buyers of watches and parts thereof are now sending to Europe. Careful attention to the needs of this market and judicious catering to its demands ought, it would seem, to bring

this business back to the United States.

Iron, manufactured.—During the six months ending June 30, 1898, 18,960,103 catties were imported into Nagasaki, including nails, screws, bolts and nuts, rails, plates and sheets, bars and rods, pipes and tubes

etc. A very small proportion of the total came from the United States; the most important items were, rails, 837,712 cattles (1,117,049 pounds), and nails, 402,800 cattles (537,066 pounds), the latter being nearly four-fifths of the whole of this item. There seems to be a very good opportunity for our iron manufacturers to secure a much larger share of

Japan's business.

Pig iron.—Of a total of 9,323,703 catties (12,214,051 pounds) of pig iron, 5,544,000 catties (7,262,640 pounds) came from the United States, and in this article there is a future. The low cost of production in the United States will much more than offset the advantage which European furnaces have in the matter of freight. A specific duty, ranging from 0.297 yen (\$0.147) for rails to 3.086 yen (\$1.536) for plate and sheet per picul, will be levied on manufactured iron after January 1, 1899; on pig, the duty will be 0.083 yen (\$0.041) per picul (133.3 pounds).

Tobacco.—The importation of cigarettes has very nearly ceased. During the six months ending June 30, 1898, only 584,000, valued at 1,557 yen (\$775), were imported into Nagasaki, and of these, many were Egyptian, Turkish, Russian, and others demanded by foreigners.

Of leaf and cut tobacco, the importation into Nagasaki during the same period was 3,132,477 catties (4,103,545 pounds) and 2,831 catties (3,709 pounds), respectively, and as the Japanese have become partial to American tobacco in cigarettes, which they manufacture in large quantities by machinery at a trifling cost, it is probable that the importation of leaf tobacco from the United States will steadily increase. A very good cigarette, alleged to be all-imported tobacco, is retailed in boxes containing ten cigarettes for three sen (1½ cents, gold) per box. The duty on leaf tobacco after January 1, 1899, will be 35 per cent ad valorem; on cut tobacco, 0.333 yen (\$0.165) per pound; on cigarettes,

1.153 yen (\$0.574) per thousand.

Locomotive engines to the value of 283,110 yen (\$130,989) were imported into Nagasaki from the United States during the six months ending June 30, 1898. It is alleged by our European competitors that the contract price for our locomotives recently received in Japan was too low to admit of the delivery of first-class engines. This, I think, is due to jealousy, for European manufacturers have looked upon Japan as their monopoly. If these engines prove satisfactory, there is a splendid market here for our manufacturers, as the plans for railway development laid out by the Government and by private companies will require a vast amount of materials for many years, all of which must come from abroad. The duty, after January 1, 1899, will be 10 per

cent ad valorem. Condensed milk.—There is no doubt that our dealers can sell a large quantity of this article, and perhaps it is not too much to say that they can control this entire market, if care be taken in the preparation and in so labeling the tins that when soiled or shop-worn they can be washed and restored to freshness; and, further, if the manufacturers will put it up in cases containing half a dozen of small tins. This will facilitate the sale to the increasing number of petty traders, whose limited capital forbids their carrying large stocks of anything; will better supply the demands of the poorer consumers, and will permit transportation throughout the interior, where the condition of the roads compels the packing of supplies in the most primitive fashion. Above all, it is imperatively necessary that the original standard of quality be rigidly maintained. The duty after January 1, 1899, will be for one dozen 1-pound tins 0.123 yen, (\$0.61), and in proportion for tins of other weights.

Digitized by Google

Butter.—The same remarks as to the care in preparation in marking tins and in putting up this article in smaller tins apply to butter. The shelves of the importing houses contain many cans of American butter which have become shop-worn and fly-specked; they can not be restored to an appearance of freshness without destroying the labels. Too much emphasis can not be laid upon the necessity of establishing a superior standard of quality and of adhering strictly to that standard, for the competition on the part of European and Canadian makers will be keen. The demand for butter is increasing as rapidly as can be expected, in the face of the religious prejudice which exists in all countries where Buddhism prevails.

The considerable importation of butter in firkins and large packages is exclusively to supply the demand from foreign residents, hotels, etc. The importation at Nagasaki for the six months ending June 30, 1898, amounted to 9,364 pounds, being a decrease of 8,653 pounds as compared with the preceding six months; of this, only 1,657 pounds came from the United States. The duty on this article has been 5 per cent ad valorem; on and after January 1, 1899, it will be 0.0645 yen (\$0.032)

per pound, specific.

Breadstuffs.—The importation at Nagasaki during the six months ending June 30, 1898, was 1,463,768 pounds, an increase over the preceding six months of 685,427 pounds. While some allowance must be made for the fact that during the period under consideration, the scarcity of native rice and its abnormally high price materially affected the demand for foreign breadstuffs, there can be no doubt that the Japanese, as a people, are becoming accustomed to the use of wheat flour, and that there will be a yearly increase in its importation. At present, the demand is principally for the cheaper grades, but the taste of the people is being educated to the use of table delicacies that require better flour. For other flour than wheat—e. g., corn, rye, graham, etc.—there is no demand, except a very small one from foreigners. After January 1, 1899, the duty on wheat flour will be yen 0.0062 (\$0.003) per pound, specific; on all other kinds, it will be 10 per cent ad valorem.

Canned goods.—The demand for fruits, vegetables, and meats in tine is confined almost exclusively to the foreign residents. The duty on all kinds of canned comestibles will be, after January 1, 1899, 15 per

cent ad valorem.

Agricultural implements.—On account of the small size of the fields in this consular district and the fact that they are often terraced on the hillsides, and therefore unsuitable for larger agricultural implements, there will probably be no demand for these for a long time. For garden tools of the patterns made in the United States, but with certain modifications to adapt them to local requirements, there may be in time a small demand, if proper measures to introduce them are adopted. These measures can readily be ascertained by following the customary methods in developing trade. The duty on all kinds of farming and agricultural implements will be, from January 1, 1899, 5 per cent ad valorem.

Leather.—There is already a considerable importation into this consular district of leather, both sole and upper, all of which is used for making boots and shoes: of this, the bulk comes from the United States, and there is no reason why our tanners should not have a practical monopoly of this business and largely increase their export of raw leather to Japan. There is little reason to expect a demand for harness leather, or for boots and shoes; there is no industry in this consular district which uses the former, and the Japanese are making the latter. The duty on leather of all kinds has been 0.0048 yen per

Digitized by Google

pound; after January 1, 1899, it will be 0.0558 yen (2.77 cents) per pound specific for sole and 10 per cent ad valorem for other kinds.

pound specific for sole and 10 per cent ad valorem for other kinds. Coal—Both Nagasaki and Moji (a nontreaty port in this consular district) are important coaling stations for the steamers of the regular foreign-going lines, cargo vessels, and coastwise craft, as well as for the men-of-war of the nations maintaining fleets in these waters.

Cotton goods.—In response to the last paragraph of the circular, which calls for certain detailed information as to cotton textiles, I have prepared a table of "cotton textiles imported into the whole of Japan during the six months ending June 30, 1898, and the countries whence imported," to which I have appended a list of the various textiles included in the table. The importation of cotton textiles at this port consists almost wholly of European goods, and exact technical information as to variance from the established standards in "the number of picks to the inch, yards to the pound," etc., is not readily procurable. I do not know of any American cotton goods imported into Nagasaki for Japanese use, except possibly a few pieces of drills.

The information I am able to obtain shows conclusively that there is a market for cotton textiles in Japan, especially in this section, which it will be worth while for our American manufacturers to cultivate. The most satisfactory method of learning how this can be done is for manufacturers to send a practical, experienced man to investigate thoroughly and to see just what the demands are and how they may be

supplied.

Japan is manufacturing large quantities of cotton crepes and coarser materials in narrow widths (about 15 inches). The former is very popular with foreigners for shirts, gowns, etc., and is exported; the latter

is used by the Japanese for dress materials.

The material called gray shirting, made at Manchester, England, in pieces of 38 inches wide, 39 yards long, weighing 10 to  $10\frac{1}{16}$  pounds per piece, and packed in bales of 50 pieces, is very popular in the far East, and it seems that our American mills might secure a part, if not the whole, of this trade, provided they quote satisfactory prices. The specific duty on gray shirting after January 1, 1899, is to be 0.006 yen (\$0.0029) per square yard.

Raw cotton.—Of the 1,512,312 piculs (201,641,600 pounds) imported into all Japan during the six months ending June 30, 1898, 659,716 piculs (87,962,133.3 pounds) came from the United States, 720,238 piculs (96,031,733.3 pounds) from British and French India, and 125,920 piculs (16,789,333.3 pounds) from China. Nagasaki imported from the United States 104,343 piculs (13,912,400 pounds). All of the cotton brought

to this port is ginned.

For most purposes, the short staple of India and China, at the cheaper prices, is well suited to the local demand. The importation of raw cotton at Nagasaki is steadily increasing, and there is an opportunity for even greater expansion. The consumption of cotton textiles can hardly decrease, and since the experiments of the Japanese Government and people to increase the crop and to improve the quality of the native cotton have not been successful, the spinners must look abroad for their raw material, and earnest effort on our part should bring them to the United States for a large portion of their supply. Raw cotton is, and will be, exempt from import duty.

# ELECTRICAL APPLIANCES.

It is worthy of note that the Western Light and Power Construction Company, of San Francisco, supplied to the recently opened Nagasaki

Hotel (one of the finest hostelries in the Far East, representing an investment of some 300,000 yen, \$1,494,000) its entire outfit of electrical apparatus, including engines, in competition with several other bidders. The same company has also secured another profitable contract.

CHARLES B. HARRIS, Consul.

NAGASAKI, October 21, 1898.

#### SUPPLEMENTARY REPORT.

As supplemental to my report on "Commerce and industries" of the 21st instant, I transmit herewith a copy of the Rules for Nagasaki Harbor, this day received from the harbor master. These rules take effect to morrow.

CHARLES B. HARRIS, Consul,

NAGASAKI, October 31, 1898.

#### RULES FOR NAGASAKI HARBOR.

SEC. 1. The harbor is divided into three districts for the anchorage of men of war,

steamers, sailing vessels, and other craft.

SEC. 2. The first district comprises all water to the northward of a line drawn from the mark post at Dejima W. ‡ N., through Yokose, to the mark post at Senowaki, on the opposite shore. The second district comprises all water between the boundary line of the first district and two lines forming an obtuse angle, one drawn from the mark post at the entrance of Kosuge shipbuilding yard NW. by N. to Tategami buoy, and the other drawn from that buoy W. 4 S. to the mark post at Tombana. The third district comprises all water from harbor limits northward to the boundary line of the second district.

Digitized by Google

SEC. 3. District 1 is the anchorage for all vessels of less than 300 register tons and

other craft

The middle part of district 2 is the anchorage for all vessels of more than 300 register tons, and to the eastward—that is, all water comprised between the shore and a line drawn from the mark post at Dejima SW. by S. to the mark post at Kosuge shipbullding yard—is the anchorage for small sailing vessels and other craft; and to the westward—that is, Akunoura and the vicinity of Tategami shipbuilding yard is the anchorage for such vessels as are under repair.

The anchorage for men of war is to be defined as to the westward of a line drawn from Tategami buoy, in district 3, SW. 1 S. to the boundary of harbor limits. All water to the eastward of district 3, comprised between the shore and a line drawn from Megamibana northeast to Kosugebana (viz. Tomachioki), is the anchorage for

small sailing vessels and other craft.

SEC. 4. The fairway of the harbor lies to the eastward of a line drawn from Tategami buoy SW. 1 S. to the boundary of harbor limits, not including Tomachioki.

SEC. 5. In case of necessity, the harbor master will assign anchorage for men of

war in district 2, notwithstanding paragraph 3, section 3.

SEC. 6. Steamers under weigh in harbor limits must keep only sufficient speed for steerage way. Sailing vessels must be under easy sail or be towed, but must not beat up against a headwind.

SEC. 7. Vessels must not interfere with the navigation or with the anchoring of

others.

SEC. 8. In harbor limits, vessels must not attempt to cross each other's bows or to overtake other vessels.

SEC. 9. All vessels on arrival must moor in the berths indicated by the harbor

SEC. 10. Vessels arriving between sunset and sunrise must anchor outside the harbor limits, but not at the entrance of fairway. Mail steamers and other vessels having appointed berths may enter at any time, weather and other circumstances permitting.

SEC. 11. In bad weather, the harbor master will indicate the anchorage for vessels

on arrival by signal from the watch station at Megami.

SEC. 12. No vessels at anchor, except men of war, may use swinging booms.

SEC. 13. No string of cargo boats, boats, or lighters may lie astern of any vessel.

SEC. 14. Warps for shifting purposes shall not be kept fast to mooring buoys or piers any longer than is actually necessary.

SEC. 15. Steam towboats in harbor limits must comply with the following rules, excepting by permission of the harbor office: First. Not more than three boats or lighters, or two cargo or water boats may be towed at a time. Second. Only one seagoing vessel may be towed at a time.

SEC. 16. Storm warning signals will be hoisted at Nagasaki prefecture.

SEC. 17. In case of heavy weather, vessels lying at buoys must veer sufficient chain before dropping an anchor.

SEC. 18. With regard to anchorage or navigation in the harbor, the "Regulations for preventing collision at sea" must be strictly adhered to, excepting anything to the contrary in these rules.

## COMMERCE OF NAGASAKI, 1897.

I inclose a statistical report of the imports and exports and of the navigation in the Nagasaki, Japan, consular district, for the year ending December 31, 1897.

Imports and exports of Nagasaki consular district from the United States for the year ending December 31, 1897.

NOTE.—The total imports from the United States into Nagasaki for the same period in 1896 were \$526,500, showing an increase in favor of 1897 of \$247,000. The principal imports from the United States last year were locomotives, provisions, wheat, iron rails, nails, pipe, and ironware, kerosene oil, raw cotton, cotton goods, lumber, wines, and liquors.

The total exports from Nagasaki to the United States during the same period in 1896 were \$36,000. The decrease, \$10,000, is almost wholly in matting.

Imports into the consular district of Nagasaki, Japan, for the year ending December 31, 1897.

#### FORMOSA.

Consul Frankenthal sends from Berne, under date of November 15, 1898, the following summary of information furnished by the Swiss consul-general in Yokohama:

Formosa, which was ceded by China to Japan in the year 1895 through the treaty of Shimonoseki, has been considered a grievous acquisition. The treasury of Japan is burdened with a charge of about \$7,500,000 on its account. It was supposed that emigration from Japan, which is enormously increasing, would wend its way to this new territory, but this hope was not realized, as the emigrants prefer Hawaii, South America, and Australia. Business is in the hands of foreigners, and there are only a few of these.

Formosa has opened to the world a dozen or more ports, of which Tamsui and Anping are the only ones of importance. The latter port led under Chinese rule, but since Japan has controlled them, Tamsui has taken the front rank.

The following firms, which do a large import and export business, are established in those ports:

In Tamsui: Jardine, Matheson & Co., branch of the Yokohama firm, and Smith, Baker & Co., also a branch of the Yokohama firm; Boyd & Co., A. Buttler & Co.; Lapraik, Gass & Co.; Malkampo & Co.

In Anping: Bain & Co.; Brown & Co.; Malkampo & Co.; J. Man-

nich & Co.; Wright & Co.

In glancing over the first Japanese statistics published respecting the trade in the aggregate between the island and other countries (business intercourse with Japan excepted), we find the amount to be \$10,000,000 for 1896, and \$12,500,000 for 1897. These are weighty figures when we consider that Formosa has no roads or railroads, and that its inhabitants are continually in a state of insurrection and rebellion, not hav-

ing had time to recuperate from the late war. The unsettled conditions are greatly aggravated by the fact that the officials are men who, being newly appointed, are not acquainted with their duties or surroundings. The figures show a tendency toward extended and healthy trade conditions in time of peace.

We need not go far to find a parallel. Thirty years ago, the commerce of the Japanese Empire stood at exactly the point at which Formosa stands to-day, the amount of \$13,000,000; in 1878, it was \$28,000,000, and in another decade, 1888, it had reached \$65,000,000,

while in 1898 it will be over \$200,000,000.

My purpose in citing the above is only to impress upon our merchants interested the importance of not losing sight of the possibilities of future commerce, when the island, through the facilities afforded by the roads and railroads, will present an extended field.

IMPORTS.

Petroleum	361, 837	185, 386

Drugs, medicines, and chemicals to the value of \$1,000,000 are worth looking after, and there should be enough ready-made clothing to spare in the United States to supply the \$75,000 worth used. In condensed milk, the United States made a fair showing in 1896, but since then, England and Holland have forged ahead. Here are the figures and countries from which the condensed milk is imported:

Country.	1897.	1896.
England	\$12,641 2,876	\$8, 800 2, 980 144
United States. Switzerland. Sweden and Norway.	782 744	2, 311 1, 389

Digitized by GOOGLO

Another item worthy of notice is candy and sweets. A beginning has been made by the United States, and if the percentage of increase is kept up, it will be possible to export a respectable amount of our candy, of which the people of Formosa seem to be fond. The supply came from the following countries.

Country.	1897.	1896.
China		\$4, 263 903
HongkongGermany	1,746 1,318	58 58
United Štates	134 16	44

The import of bottled beer into Formosa was 90,147 dozens in 1897,

against 70,475 dozens in 1896.

The clock import, which at present seems to be controlled by Germany, presents interesting details. How many American clocks found their way into the island credited to other countries can not be ascertained. Here are the figures:

	1897.		1896.	
Country.	Number. Valu	Value.	Number.	Value.
Germany England United States	769 29	\$7, 743 1, 310 47 174	2, 861 599 290 2, 325	\$3,762 1,033 489
Hongkong	6	16	33	3, 758 56
Other countries	153	267	1, 195	1,846

Regarding the import of petroleum, detailed statistics are lacking.

#### EXPORTS.

Tea (black).—China is the best customer for this tea, which is exported through firms domiciled in Amoy. Direct shipments have begun to be made to the United States. The total export in 1896 amounted to \$2,927,000, and in 1897, to \$3,453,000.

Rice.—Export, 1897, \$899,000; 1896, \$455,000.

Camphor.—Camphor is the next important article, and is in the hands of German and Chinese firms. The export in 1897 amounted to \$664,500, against \$1,123,000 in 1896. The Japanese have successfully stopped the indiscriminate felling of camphor trees.

Sesame.—Out of the straw-colored kernels, an oil equal to olive oil is pressed. The export of these kernels amounted to \$76,800 in 1897 and

\$17,900 in 1896.

Saffron.—Export, 1897, \$26,400; 1896, \$14,700.

#### RAILROADS.

Three years ago, a concession was granted to a Japanese company for the building of a railroad to traverse the island. Since then, five extensions of time have been given, but owing to the company's inability to raise the necessary funds, the project has been abandoned. At the next sitting of the Japanese Parliament, a bill will be introduced to provide for the building of a railroad to be paid for by the State. It is estimated that the cost will be about \$15,000,000. Digitized by Google

## KOREA.

#### TRADE IN FIRST HALF OF 1898.

There is very little that I can add to my exhaustive report on the trade of Korea published in Consular Reports, No. 215, August, 1898.1 The customs statistics are not fully made up, and while, by the courtesy of the chief commissioner, I have had access to these statistics, quantities only are mentioned in the preliminary reports, and as my full report dealt more particularly with values, the facts now at hand will be of little use for comparison.

I append a table giving the quantities of the principal articles of import and export, by ports, for the first half of this year. This table is chiefly valuable in showing the growing importance of the two new

ports opened to trade last autumn-Chenampo and Mokpo.

In my report published in Advance Sheets of Consular Reports, No. 172, July 21,2 I called attention to the proposed opening of four new ports in Korea. The preliminaries for the opening of these ports are

now about completed.

A concession for a railroad to connect Seoul and Fusan has been granted to the Japanese Government for a syndicate of Japanese capitalists. The road will have to be broad gauge, to conform with a Korean decree compelling this gauge. The distance is given roughly at 400 miles, and the road is estimated to cost 25,000,000 yen (\$12,-500,000, gold), though it is thought this will have to be doubled.

The concession is for a period of fifteen years, after which the Korean Government may buy it on appraisement. The right of way is furnished by the Government. Work must be begun within three years from the date of signature of the concession, and must be completed within ten years from the date of commencement. Korean mails will be carried free. I am told that much of the equipment will be purchased in the United States.

The first and most important railroad in Korea, one of 25 miles in length, connecting Seoul, the capital, with its port, Chemulpo, is now being built by Americans, upon a concession granted to an American.3 This road has been hypothecated to a Japanese syndicate, who will secure it upon completion. Materials for this road are admitted into Korea free of duty, and do not appear in the customs statistics submitted to me. I understand from the company, however, that it imported materials during the first half of this year to the amount of 300,000 yen (\$150,000 gold).

The American constructor of the Seoul-Chemulpo railway is also building (for a Korean company) an overhead trolley electric railroad for the city of Seoul.3 The road is to be but 6 miles in length for the present. So far, nothing but the rails have been imported. The equipment is due to arrive shortly. The importation of rails for this road

amounted to 22,000 yen (\$11,000, gold).

Americans are operating the principal gold mines of Korea,5 much material for which was imported during the first half of this year. Statistics are not available in the short time I am allowed for preparing this report. I hear from the company, however, that their importation for the first half of this year will exceed \$100,000, gold.

Digitized by GOOGIC

<sup>&</sup>lt;sup>1</sup> Also in Advance Sheets, No. 142, June 16, 1898.

Also in Consular Reports, No. 216, September, 1898.
 See Advance Sheets, No. 142, June 16; Consular Reports, No. 215, August, 1896.
 See Advance Sheets, No. 24, January 29; Consular Reports, No. 210, March, 1898.

A German syndicate also has a mining concession, and has started to its location to begin work. It will develop only the placers for the present, I understand.

The consumption of American kerosene is steadily increasing, and

with better means of communication, must greatly develop.

The value of this import for 1897 was \$232,386, gold, against \$165,004 for 1896. It is thought that this year will show a further increase.

There is a steady influx of Chinese and Japanese merchants into Korea. The Korean traders are being gradually crowded out, and as the newcomers are much better business men than the Koreans, and as they go into the interior, they form an important factor in the introduction of foreign goods into Korea. As to the matter of the introduction of labor saving machinery, textiles, tools, shoes, etc., there is no present demand for machinery, and I doubt if cottons (the only cloth in demand) can make greater headway against the cheap product of Japan than they are now making. There should be a small demand for our cheap grades of shoes, as the Korean soldiers now wear Japanese and native made leather shoes instead of sandals.

The banks of Korea are Japanese, and the rates of exchange of Japan hold here, with a slight difference for local exchange. As Japan has adopted the gold standard, Korea is practically on the same footing. The council of state recently passed a resolution to adopt the gold standard, as the result of the visit to Korea of one of Japan's chief bankers. Nothing has as yet been done in the matter. It is hardly necessary, so long as Japanese banks and Japanese money prevail here.

Private telephone lines are now maintained in Seoul, chiefly for Government use.

As to cottons, I can only find that standard weights are imported. The Koreans are slow to change their ideas as to goods in use.

The general trade for the first half of this year is not up to the usual standard, because of a very poor rice crop last year. The prospects for harvest are excellent, and trade for the last quarter of this year and

HORACE N. ALLEN, Consul-General.

SEOUL, September 20, 1898.

for the first half of next year will improve.

Principal articles of import and export for Korean ports first half of year 1898.

## PERSIA.

The trade of Persia varies but little from year to year, and any disturbance of the ordinary equilibrium has, for some years past, generally had the effect of decreasing the volume, especially of imports, as the foreign demand appeared less subject to disquieting fluctuations than the home consumption. Some Persian productions have within the last fifteen years met with considerable encouragement in western markets, apparently supplying a want which fashion or the necessity of the times has created. It may be hoped that these natural and artificial objects of commerce will receive a still greater stimulus, so as to reduce the inequality of the financial exchange.

Every department of this Government and administration, both judicial and executive, is more or less a paradox, and the revenue in its relation to the extent of trade and industry and the economical

condition of the people is no exception to this rule.

For the last two years, while trade has been dull and declining, the customs returns, without any addition to the duties, have increased more than 25 per cent. Although money for the last twenty-five years has never been so scarce, enterprise so helpless, and the labor market so paralyzed, yet in spite of the most favorable of seasons, a harvest above the average and a decreasing population, many of the necessaries of life are more than 300 per cent above the normal price. How a large proportion of the population of the principal cities of Persia lives is one of the insolvable mysteries of existence. Yet with all this, and in spite of all this, the revenue of the Government is larger than it was three years ago. This is due to the competitive farming of the taxes by private individuals. The system is self-condemned, but it shows to what an extent, under a corrupt form of collection, on the one hand the Government may be defrauded and on the other the people If in times of depression like the present the may be oppressed. revenue can be increased, it is clear to what an extent it must have been tampered with in prosperous years. Nevertheless, the Persian Government still concludes and declares that it obtains more by this method than if it took the collection into its own hands.

In reporting on the state of trade and industrial enterprise in Persia, one receives no assistance whatever from the usual sources of Government information. No statistics are published, and on appeal to the newspaper press, one is told that every town and province throughout the country is in a most flourishing condition, when it is known that the very opposite state of things prevails almost everywhere.

It is to the tax farmer's interest to suppress as much information as possible, and to make his returns so low that his advances and remit-

tances may leave him a substantial margin.

Merchants' accounts cover but a small portion of the actual commercial area. Their operations are limited to certain districts or towns, and nothing reliable can be obtained from the native traders. It is to the interests of the more important foreign merchants, like the tax farmers, to withold statistical information, so as not to tempt others to enter into competition. Any theory based on tax farmers' or merchants' accounts would be very far removed from actual facts.

The United States having no consular officers or agents outside of Teheran, all statistical information from the ports of entry and trade centers is obtained through the courtesy of the English or Russian consular officers at these places. Even this information is incomplete, as it does not include places of minor importance, of which there are

Digitized by Google

several on the Caspian and on the arbitrary land frontiers, which extend

long distances, and where no consulates exist.

Owing to the high transit duties of Russia on goods coming via the Batoum Baku-Resht route, the only routes open to American competition are the long caravan roads via Trebizond and Tabriz, Bagdad, and Bushire, on the Persian Gulf. These routes have been fully described in Mr. Tyler's consular report of June 24, 1894, but it may be here stated that the average time of overland transit to Teheran from Trebizond is about ninety days; from Bagdad forty days, and from Bushire about sixty days. It should be observed, however, that these represent the minimum periods, and are made between September and May. The caravans travel more slowly in the summer than in the winter, consequently, winter is the best time for transport.

Of the total foreign trade of Persia, estimated on the basis of returns from the following places, about 27 per cent of the imports come via Bushire, 18 per cent via Lingah (on the Persian Gulf), 15 per cent via Bender Abbas, 4½ per cent via Mohammerah, 1½ per cent via Meshed,

9 per cent from Tabriz, and 18 per cent from Resht.

In other words, of the total value of exports and imports, about twothirds is by way of the Persian Gulf and one-third through the northern cities of Meshed, Tabriz, and Resht. The foreign trade of Resht is almost exclusively Russian, and, with the exception of some local commerce with Merv, Bokhara, and Afghanistan, this is also true of Meshed. A considerable part of the foreign trade of Tabriz is also with Russia, rather than with Europe via Turkey, so that, exclusive of the Russian trade, a small interchange of commodities with Merv, Bokhara, and Afghanistan, and the European goods arriving via Trebizond, the great bulk of foreign commerce is via the Persian Gulf.

#### TARIFF AND FREIGHT.

Uniform import and export duties of 5 per cent ad valorem are levied on all merchandise. The overland transport charges per ton to Teheran are at present from Bushire about 25 cents per mile; from Bagdad, about 20 cents per mile; from Trebizond and Tabriz, about 20 cents per mile, and from Resht, 15 cents per mile. These charges vary considerably and have steadily increased of late years. From the above facts it is seen that on the whole the best route for American imports is that via Bushire, not only for the southern and central cities of Bushire, Shiraz, Ispahan, but also for Teheran. Transport over all these routes is by mule, donkey, and camel, and the few cases of American goods which reach Teheran invariably show inferior packing. It is useless to send merchandise, which is to be conveyed on the backs of animals for several months, and is to be loaded and unloaded daily by not overcareful muleteers, without special and careful packing. contrast between American packing and that of England and Germany is marked, and the arrival of even superior goods in an inferior condition is a poor trade advertisement, and has a depressing effect on the efforts to introduce American wares into the Persian market.

### HOW TO EXTEND TRADE.

This consulate is in constant receipt of letters relative to the introduction of American products, inclosing circulars descriptive of goods, and asking to be put into communication with engineers, architects,

contractors, etc., and with business houses dealing in articles whose introduction is desired. As a rule, circulars are absolutely worthless. The Persian merchant is not accustomed to this way of doing business. and both merchant and consumer must see with their own eyes before purchasing. A single agent on the spot, with samples, would accomplish more than all the circulars ever sent to Persia. English, Belgian, German, Austrian, and Russian firms show far more enterprise in this respect than Americans. It must also be borne in mind that no such persons or business houses as those to which American exporters seek introductions are known in Persia. There are no native organized companies for either trade or manufacturing purposes; very little capital is invested in business enterprises. The native merchant conducts his business on altogether too insignificant a scale to be of any use to the American exporters. Competing European houses are, of course, not available, and reliable native consignees do not exist. American enterprise desirous of competing in this market must have personal representation on the spot. The Persian buyer, not the American seller, determines the kind of goods wanted, and the manner of labeling and the appearance generally, and neither catalogues nor circulars can compete with the English, Russian, and German merchant with his goods on the spot. This is especially true of a market to which American goods are practically as yet unknown. It is not probable that the sending of representatives on the part of individual exporters in any one line of goods would pay at present, but it is almost certain that the establishment of a general agency on the part of a number of manufacturers would prove successful. Several shops have been opened in Teheran for the sale of European goods, and the local manufacture of sugar, glass, etc., has been attempted by foreign capital. None of these ventures has proved very successful. Their failure is due to expensive organization, the difficulty of obtaining a uniform supply of the crude materials, and, in the case of shops for general stores, to the laying in of large stocks unsuited to native use, or specially adapted to the foreign or better class of Persian buyers, of which there are not sufficient to support such enterprises. For, while the people are poor and unaccustomed to business, it is on the middle and lower classes that the foreign merchant must rely for support.

The expenses of such a general agent, as has been suggested, would be small. There are one or two persons resident here who could act in that capacity, and some personal knowledge of eastern life, manners, and the language is indispensable. Such an enterprise should begin with samples of such articles as would probably find a sale. The market should be tested and orders given only for such products as are

found to meet an assured demand.

Petroleum heaters.—Winters in the north of Persia are severe, and good Russian petroleum cheap and abundant. The better houses have fireplaces for coal, which, however, is too expensive for general use. Wood is very scarce, the chief reliance for heating purposes being a pan of charcoal placed under a wooden frame covered with a cloth, around which the occupants of the room sit or recline. Cheap but good petroleum heaters would doubtless meet with a large sale. There are none of native or Russian manufacture, and so far, this field is unexploited. It is not so certain that petroleum stoves for cooking purposes would find a ready sale, for a few years ago, an English merchant imported a considerable number and he was in the end obliged to sell them at a loss. They meet a want felt sometimes among the foreign community, but they are not well adapted for the preparation of Persian dishes, which consist to a great extent of rice, in the cooking of which the

Digitized by Google

Persians are very skillful. In this connection, it may be stated that the Persian is very conservative in his tastes and is wedded to usage and slow to change his habits, and for these reasons, inferior goods will find a smaller market here than elsewhere. He must be tempted by a really superior commodity at a reasonable price, and in this case is usually quick to perceive its advantages.

Ornamental coal stoves for heating purposes, if the cost were not too heavy, would meet with a considerable demand. Such as have been brought here have been greatly admired, and no difficulty has been

found in obtaining purchasers.

Sewing machines, generally of an inferior make, are quite common in cities and towns, and are sometimes found even in villages. These machines, with cotton specially prepared for them, would find a steady demand.

Knitting machines for men's socks have only recently been introduced, but it appears that they are now in considerable request, and

when put on the market, are bought at a handsome profit.

Shoes.—A low, open shoe or slipper, unlaced, but with elastic web let in at the sides, so that it can be easily removed on entering the house, would most likely find a profitable market.

Canned goods, such as salmon, lobster, beef, bacon, ham, cheese, cornstarch, oatmeal, arrowroot, tapioca, sago, pease, asparagus, maple sirup, jams, preserves, candies, etc., are imported generally by foreigners.

Leather for carriage and harness work, for boots and shoes, and for

ordinary tackle is always in demand.

Phonographs.—This diverting instrument is a source of great amusement and much surprise to the Persians, and many inquiries are made concerning its price and possible importation. If it could be imported

at a low figure, it would find a ready sale.

Drugs.—The drug market is supplied to a great extent from England, Germany, and India, but considerable quantities are imported from the United States for the use of mission hospitals, dispensaries, etc., and there is no reason why this branch of the Persian trade should not be developed.

Clocks and watches.—Clocks in fancy styles, with accessories to match, such as equestrian figures in bronze or imitation, knights in armor, or vases, are favorite ornaments with the Persians, and, if they are put on the market at a reasonable price, find ready buyers. Watches to suit

all customers are usually in demand.

Safes made for convenient transport, with intricate but strong locks, have a considerable sale. The Russian article is very indifferent and

affords but little protection to the contents.

Harness, with a good sprinkling of silver, electroplate, or good brass mountings, made in durable leather, in double or single sets, is always salable.

Wall paper, cheap, with bright, taking patterns, with some of a

higher class to suit more ambitious tastes, can be easily sold.

Stationery.—The English, French, German, and Russian manufactures at present divide the markets; but there is still much room for improvement, both in quality and price, and anyone who could enter the market at a lower figure would doubtless secure the trade.

Cotton goods.—Nearly all the cotton goods consumed in Persia are supplied by England and Russia, and though of an inferior quality and the price rather high, it is doubtful whether American merchants could

compete successfully with their European rivals.

Locks, bolts, door and window fasteners of American make are generally appreciated; but the supply hitherto has had no appreciable effect

Digitized by GOOGLE

upon the market, and they are always sold under the name of some

other nationality.

Air-motor pumps.—Within the last six months, two pumps have been erected in this city, exciting a good deal of curiosity and interest. His Majesty the Shah has expressed his intention of having five or six erected in his various palaces, and people in positions of influence and wealth are talking of giving them a trial. Considering the long drought of summer, which tries the crops and all kinds of vegetation, they should meet a much-felt want and create a considerable demand.

Carriages.—Light, serviceable carriages of the phaeton pattern and make—not road wagons or buggies—if capable of standing the heat and dryness of summer, and if they could be supplied at reasonably low

prices, would obtain a ready market.

In trading with Persia, much prudence and discrimination are necessary in order to meet the necessities of the people and avoid trespassing on their prejudices and sensibilities. Many promising and hopeful enterprises have been totally wrecked, simply because those who were appointed to the management refused to accommodate themselves and

their wares to the habits and tastes of the people.

As for cotton goods, the class measuring  $3\frac{1}{2}$  yards to the pound, averaging 64 by 70 to the square inch, sells at retail at  $9\frac{1}{2}$  cents per Persian zar, or 41 inches. The variety measuring 4 yards to the pound, 58 by 85 to the square inch, sells at 7 cents per zar; that averaging 69 by 69 to the square inch and 3 yards to the pound sells at  $8\frac{1}{2}$  cents per zar, and that averaging 54 by 60 to the square inch and 5 yards to the pound sells at  $6\frac{1}{2}$  cents per zar. The white goods in use are heavily starched, and the grays consist of very flimsy texture.

They are, notwithstanding these defects, such as suit the taste and

means of the people, and with which they are apparently content.

Whether the Persian market offers sufficient inducement to the American manufacturer and merchant to participate in its trade, is a question which can only be proved by experience, and it is evident that this can not be put to the test but by some speculative enterprise involving risk and possible loss. The articles enumerated in this report present fair openings for commercial rivalry, and with such improved methods of manufacture as we now possess, I do not think our competitors need fear the result.

I have delayed this report for some time, in the hope that I might have the advantage of consulting the English consular reports for Persia for the year ending April 1, 1898, which the English minister has courteously promised to place at my disposal. They have not, however, yet been received at his legation, and it being uncertain when they may arrive, I feel that this can not well be kept back any longer.

ARTHUR S. HARDY, Consul-General.

TEHERAN, October 7, 1898.

## STRAITS SETTLEMENTS.

In compliance with the instructions contained in the Department's circular of August 5 last, I transmit copies of a comparative statement of the values of articles exported from this colony to the United States and of articles imported from the latter to these Settlements during the years 1896-97, with a memorandum showing an increase for the latter period, in the value of the gross trade between this district and the United States, of \$4,492,942, or 27.36 per cent.

Similar statements giving comparison of the same trade for the first six months of 1898 with that for the similar period of the previous year, as well as the further matter referred to in above instructions, are now being made out and will go forward by next mail.

Comparative statement of the gross trade of the Straits Settlements with the United States during the years 1896-97.

Exports to the United States, 1897	1 <b>\$18, 541, 023</b> <b>2, 370, 350</b>	
Exports to the United States, 1896	14, 438, 275	, ,
Not increase (97.96 per cent)		4 492 942

¹The values in these tables, which compare the trade for 1896 and 1897, are given in Mexican currency. As the value of the Mexican dollar averaged 53.5 cents in 1896 and 48.3 cents in 1897, no attempt has been made to give the equivalents in United States currency, as in many cases the increase in certain lines, expressed in Mexican dollars, would be a decrease if expressed in United States money. The gold values of the trade are given in the supplementary report.

E. SPENCER PRATT, Consul-General.

Digitized by GOOGIC

SINGAPORE, October 20, 1898.

#### SUPPLEMENTARY REPORT.

The Straits Settlements, constituting together a single British Crown colony, are situated on the islands immediately adjacent to the Malay Peninsula, at the southern extremity of which lies Singapore, the capital and principal port, the other ports Penang and Malacca. The area of the colony is 1,526 square miles. It comprises the island of Singapore, the town and province of Malacca, the territory of the island of Dingings, the town and island of Penang, Province Wellesley, and their dependencies. The Cocos or Keeling Islands and Christmas Island, situated in the Indian Ocean, were placed under the government of the Straits Settlements in 1886 and 1889, respectively. The governor of the Straits Settlements is also High Commissioner for the Federated Malay States and High Commissioner for the territories of the British North Borneo Company, Brunei and Sarawak.

#### COMMERCE.

In 1896 and 1897, the value of the gross trade of this colony, deducting treasure, was—

	1897.			1896.		
	Mexican.	Sterling.	United States currency.	Mexican.	Sterling.	United States currency.
Imports	\$198, 349, 233 172, 661, 634	£19, 661, 317 17, 079, 781	\$95, 681, 799 83, 118, 754	\$186, 196, 932 161, 777, 519	£29, 218, 851 17, 565, 784	\$98, <b>895</b> , 038 85, 483, 888
Total	371, 010, 867	86, 741, 098	178, 800, 553	347, 974, 451	37, 784, 635	183, 878, 926

This represents an increase in value of imports of \$12,152,301 (Mexican) and of exports of \$10,884,115 (Mexican), but shows a decrease in sterling of £557,534, or \$2,713,239 United States currency, for imports, and £485,803, or \$2,365,134 United States currency, for exports.

The principal articles of export from the Straits Settlements are gambier, gutta-percha, coffee, hides, rattans, sago flour, pepper, tin, tapioca, copra, nutmegs, canes, gum benjamin, gum copal, gum dammar

gamboge, stick-lac, mother of pearl shells, etc.

The principal articles of import into the Straits Settlements are cotton goods, specie, provisions, coal, rice, hardware and cutlery, twist (colored and plain), handkerchiefs, paper, malt liquor, spirits, tobacco, wheat flour, petroleum, and European and American manufactures.

The total value of the gross trade for the six months ending June

30, 1897 and 1898, was—

	Mexican.	Sterling.	United States currency.
First six months: 1898	\$195, 998, 781 176, 374, 292	£18, 579, 042 18, 096, 786	\$90, 414, 908 68, 067, 766
Increase	19, 624, 439	482, 306	2, 347, 142

The value of imports during the first half of 1898 was \$103,658,637 (Mexican), or £9,825,974, or \$47,818,302 United States currency, showing an increase of \$6,214,184 (Mexican), but a decrease in sterling of £172,232, or \$828,867 United States currency, as compared with that for the same period of 1897.

The value of exports was \$92,340,094 (Mexican), or £8,753,068, or \$42,596,805 United States currency, showing an increase of \$13,410,255 (Mexican), or £654,538 sterling, or \$3,155,309 United States currency,

as compared with the figures for the first half of 1897.

#### SHIPPING.

The tonnage of ocean-going vessels, including warships, which arrived at and cleared from the ports of the Settlements of the colony during 1897 was 14,369,830; during 1896, 13,052,630, an increase of 1,317,200 tons.

During the first six months of the present year, the aggregate tonnage of arrivals and departures in Singapore alone was 4,097,142, a decrease of 613,206 tons compared with the same period of the previous year, due in great measure to the war conditions existing since April last.

#### FINANCIAL.

Currency.—The silver dollar (British, Mexican, Hongkong, and Japanese) of 100 cents, with the following silver and copper coins representing fractional parts of a dollar:

Silver: Fifty-cent (half-dollar) piece, 20-cent piece, 10-cent piece, 5-cent piece. Copper: One-cent piece, one-half-cent piece, one-fourth-cent piece.

Bank-note circulation, \$6,734,049 (Mexican).

The note issue is in the hands of the Chartered Bank of India, Australia, and China, and the Hongkong and Shanghai Banking Corporation. The first-named bank is bound by its charter of incorporation

and the other by ordinance, to maintain specie to the extent of one-

third the amount of the issue of notes.

Exchange.—During the year 1897, the average rate with London was: Bank bills sterling, on demand, 1s.  $11\frac{1}{16}$ d.; four months sight, 1s.  $11\frac{6}{16}$ d., the highest and lowest quotation being for demand 2s.  $1\frac{1}{16}$ d. and 1s.  $9\frac{1}{16}$ d. and for four months 2s.  $1\frac{1}{16}$ d. and 1s.  $9\frac{1}{16}$ d., respectively. The average of exchange on New York is obtained by converting the above demand rate on London into United States currency at 4s. 2d. to the dollar.

The banking institutions doing business in the colony are the following:

Revenue.—The revenue of the colony for 1897 was \$4,320,207. This was in excess of the estimate by \$311,472, and in excess of the revenue of 1896 by \$54,143.

The expenditure for the year had been estimated at \$4,524,775. In

the actual result, \$95,081 less than that sum was expended.

#### TRANSPORTATION.

Ocean.—The great ocean lines connecting Singapore with the ports of Europe and the far East and by transshipment with those of the

Atlantic and Pacific coasts of the United States, are:

(1) The Compagnie des Messageries Maritimes (French); (2) The Peninsular and Oriental Steam Navigation Company (British); (3) The Norddeutscher Lloyd (German); (4) The Austrian Lloyds Steam Navigation Company (Austrian); (5) The Compagnia Transatlantica (Spanish); (6) The Deutsche Dampfschiffs Rhederei (German); (7) The Ocean Steamship Company (British); (8) The Glen Line of steam packets (British); (9) The Navigazione Generale Italiane (Italian); (10) The Ben Line (British); (11) The China Mutual Steam Navigation Company, Limited (British); (12) The Nippon Yusen Kaisha (Japanese).

The chartered steamers (freight only) of Messrs. Barber & Co., of New York, leave that port about twice a month for this place and ports of China and Japan; but these, though direct, are not regular and

carry only freight.

Lines to adjacent states and colonies.—The British India Steam Navigation Company, Limited (British), Singapore, Calcutta, and intermediate ports; the Koninklyke Paketvaart Maatschappy (Dutch), Singapore and Batavia; the Messageries Maritimes (French), branch line, Singapore and Java ports, Singapore and Saigon; the Ocean Steamship Company (British), Singapore to Bangkok, Singapore to Saigon, Singapore to Netherlands Indies, Singapore to British North Borneo; Apcar and Jardine Lines (British), Hongkong to Calcutta, calling at Singapore; Sarawak and Singapore Steamship Company (Sarawak Government), Singapore and Kuching (Sarawak).

Coastwise and river lines.—There are numerous vessels engaged in the coasting trade of the Malay peninsula between Singapore and Penang, which call at the intermediate ports of Malacca, the Dingdings, Port Dickson, and Port Weld, and also proceed up the Klang and Perak

rivers as far as navigable.

The Straits Steamship Company is the principal line in the trade, and the one which carries the regular mail.

Roads, railways, and canals.—There is a complete system of macadamized roads throughout the colony of the Straits Settlements, but since these are not commercial routes, they will not be considered in the present report. There are no navigable canals in the colony proper, no railways, and only about 10 miles of tramway, at Penang.

For particulars in regard to this whole subject of transportation, I would refer to my contribution to the Department's Special Consular

Reports of 1895, entitled Highways of Commerce.

## COMMUNICATION BETWEEN THE UNITED STATES AND SINGAPORE.

(1) From San Francisco, via Yokohama and Shanghai, to Hongkong, and thence by transshipment to Singapore via Saigon. (2) From New York to Europe and thence by transshipment, via Suez Canal and Colombo, to Singapore. (3) From New York to Singapore direct via Suez Canal and Colombo.

The first of these routes is the most expeditious to the Pacific coast, the second to the Atlantic coast. The third, though direct, consumes more time, from the fact of the steamers being slower, besides having as yet no fixed dates of departure.

#### FREIGHT.

Freight to London in 1897 ranged from 12s. 6d. to 37s. 6d. (\$3.03 to \$9.11) per ton, Singapore scale. This year it ranged from 27s. 6d. to 52s. 6d. (\$6.68 to \$12.75).

To the United States (New York), 1897, it ruled from 15s. to 22s. 6d. (\$3.64 to \$5.46) per ton, Singapore scale; present rates are from 20s.

to 25s. (\$4.86 to \$6.07) per ton, Singapore scale.

To San Francisco via Hongkong: To Hongkong, \$3 per ton without any deviation since last year; to San Francisco as per schedule; to Calcutta as per schedule.

#### INDUSTRIES.

The following are the principal local industries: The tin smelting works, said to be the largest in the world—the yearly consumption is stated to be 64,933,333 pounds of ore, and the yearly output 45,333,333 pounds of metal; the aerated waterworks, which are estimated to turn out about 12,500 gallons per month; the ice works manufactory, with an average production of 70 tons (British) of ice per day; the canning works, producing some 125,000 cases of preserved pineapples per season.

Besides the above, there are a number of sawmills, small rice-clean-

ing mills and distilleries, and the shipbuilding yards.

#### TELEGRAPHS.

Through the Eastern Extension Australasia and China Telegraph Company's system and connections, this colony is in telegraphic communication with all parts of the world.

#### GENERAL.

There are no duties on foreign imports entering the Straits Settlements, no restrictions imposed upon commercial travelers, and no laws or regulations of a discriminating character which affect American shipping. Goods are not required to be marked so as to show the country of origin or manufacture.

#### TRADE WITH THE UNITED STATES.

The general trade between the United States and this colony has greatly improved during the past year, its total value being \$20,911,373 (Mexican) (\$10,183,839, gold), of which exports to the United States represented \$18,541,023 (\$9,029,478, gold), and imports from the United

States \$2,370,350 (\$1,154,360, gold).

An examination of the comparative statements recently forwarded will show that, in exports, the greatest increases have been in tin, coffee, gambier, and in lesser degree, gum copal, gutta-percha, gutta of other sorts, cassia, black pepper, nutmegs, tapioca, cloves, etc. Of the decreases, the more important were in rattans, rubber, white pepper, sago, rawhides, cutch, essential oil, mace, green snail shells, long pep-

per, etc.

As regards the imports, the following accounted for the greater part of the increased value: Wheat flour, machinery, lubricating oil, drugs and chemicals, hardware and cutlery, provisions, oilman's stores, carriages and carriage materials, telegraph and telephone materials, copper ware, lamps and lampware, muskets, rifles, etc. Petroleum, gas and electric-lighting materials, coal, scrap iron, tools and implements, clocks and watches, canvas, tar, medicines, wick and waste, wooden ware, etc., make up the list of decreases.

During the six months ending June 30 of the present year, the trade has shown, in comparison with that of the six months of 1897, a large increase, the total value being \$11,217,754 (Mexican) (\$4,509,537, gold), of which \$9,793,820 (\$3,937,116, gold) was in exports, and \$1,423,934

(\$572,421, gold) was in imports.

The principal increases in exports were in tin (again the largest), gutta-percha, rubber, gum copal, nutmegs, tapioca, white pepper, essential oil, cubebs, rawhides, preserved fruits, gamboge, tortoise shell, mace, etc.

The decreases were in coffee, black pepper, gambier, sago, rattans

and cloves, cassia, gum dammar, etc.

In imports, the following articles gave the largest increases: Petroleum, wheat flour, carriage and carriage materials, tobacco, cotton goods, medicines, ironware, lamps and lampware, tools and implements, apparel, etc.

The principal decreases were represented by machinery, lubricating oil, drugs and chemicals, clocks and watches, oilmen's stores, telegraph

and telephone materials, etc.

E. SPENCER PRATT, Consul-General.

SINGAPORE, November 16, 1898.

#### PACIFIC MAIL AND OCCIDENTAL AND ORIENTAL STEAMSHIP COMPANIES.

Rates of freight from Hongkong to San Francisco on the undernoted cargo, shipped on through bills of lading signed in the Straits Settlements, Java ports, Aden, Colombo, or Bombay, exclusive of transfer expenses at Hongkong. All rates are in United States gold coin.

### TURKEY IN ASIA.

#### SIVAS.

There are no accurate statistics available for a commercial report. Few figures are kept in this consular district. There is no direct trade between the United States and this district, except a very little at Samsoun and Trebizond. Nearly all goods for this section enter the country at Constantinople. Prices current are of little value, because they are not fixed, but vary with the ability of the purchaser to beat them down and with changing local conditions. One rarely thinks of paying more than 75 or 50 per cent of the prices first demanded. A severe snowstorm may interrupt traffic with the seacoast and advance prices of staple articles 50 per cent.

## PROVINCE OF SIVAS.

Some observations on the condition of commerce and industries in the province of Sivas may be of interest and give a general idea of any one of the eight provinces of Anatolia.

The province of Sivas has a climate and physical conditions resem-

bling that of Colorado. It has an area of about 52,000 square miles, and an estimated population of 1,005,000 Mohammedans and 180,000 Christians living in 6 cities and 4,700 villages. The inhabitants are essentially an agricultural people. There is no direct trade with the United States or any other foreign country in this province.

#### MANUFACTURES.

With the exception of low grades of cotton cloth, a little cashmere, rude wagons, harnesses, shoes, stoves, furniture, copper vessels, knives, and axes, almost everything of a manufactured nature is imported, and almost entirely from Europe. Agricultural products are given in exchange. The farmer supports the local merchant, who buys European goods of the Constantinople and Samsoun importers. Few products of value, except wool and skins, leave the country.

#### ECONOMIC CONDITIONS.

The standard of living is very low, but has a tendency to slowly advance as the people are brought more and more in contact with Western civilization. The natural resources of the country are steadily diminishing. Methods of agriculture are centuries behind the times, and are exhausting the soil. Trees are being destroyed root and branch. No railroads exist, though during the past fifty years they have often been projected. The people generally buy only the cheapest grades of goods of German and Austrian origin, but sometimes they have learned the economy in buying goods of real value and superior quality.

The conditions of commerce were much affected by the massacres of 1895. The losses in this province are estimated at 11,000 houses and 3,500 shops looted, 2,000 houses burned or ruined, 5,260 Armenians and 241 Turks killed. The estimated value of property of Armenians lost or destroyed was \$19,098,400. The general results were the diminution of agricultural products and government receipts, loss of commercial confidence and credit, increase of poverty, and general paralysis of trade. The province has slowly recovered from the effect of these events, the recovery being hastened by the charitable contributions of America and England and hindered by subsequent massacres at Tokat, Egin, Constantinople, and other places, and by an increase of brigandage. Another hindrance to commercial revival has been the fact that since the massacres Armenians are practically prohibited from going to Constantinople.

#### IMPORTS AND EXPORTS.

The accompanying tables of estimated imports and exports at Sivas may be taken to represent in a general way the commerce of the chief interior cities of this consular district, viz, Sivas, Amasia, Tokat, Cesarea, Karpoot, and Marsivan. The special industries of these cities are: At Amasia, the manufacture of flour, dried fruits, and silk; at Tokat, liquor (raki) and copper dishes; at Cesarea, rugs and carpets; at Marsivan, "tireh" (gingham) and Turkish towels.

#### NOTES ON IMPORTS.

The feature of the import trade is the German competition with English goods. This, I suppose, is due to political conditions, which favor Germany, the energy of German manufacturers, the establishment of German houses at Constantinople, the abundance of their traveling salesmen, the low cost of their products, and the fact that they quote

prices at Constantinople in weights and measures comprehended by oriental merchants.

Coffee is chiefly Rio; retails at 8 to 14 cents a pound.

Copper is chiefly sheet copper, and is used in the manufacture of all sorts and sizes of cooking utensils, which have a pretty constant value of about 20 cents a pound.

Cotton goods are generally known as "Manchester goods," but it is interesting to note that unbleached cotton sheetings are universally called "American cloth." The sheeting manufactured by the Dwight Manufacturing Company under the name of "Cabot A" has a large sale all over Asia Minor, and the demand is increasing as its superior quality and durability become recognized. British Consul Shipley reports that \$12,000 worth was sold at Angora this last year. This popularity has led to the introduction of several imitations of inferior quality.

Cotton cloth of native and foreign make form the bulk of the clothing of both men and women throughout all seasons of the year. The cotton goods of foreign make are chiefly lower grades of prints and unbleached sheetings. Prints of bright colors, especially reds with floral designs, are most sold. The Sivas women eagerly seek new patterns. The prints commonly sold here cost at Constantinople 6 to 6½ cents, 30 inches

wide.

The sheetings most largely sold are of 48 threads each way, and 4 yards to the pound. They cost at Constantinople 4 cents a yard, 31½ inches wide. In drillings, goods costing 4½ cents a yard, 28½ inches wide, sell most extensively, but a superior article of American make (Lyman Mills, extra heavy, H) has an increasing sale.

White cotton shirtings sell moderately well, not so much for shirts as for curtains, furniture covering, tablecloths, napkins, etc., among the richer people. The sort most sold costs at Samsoun 5½ cents a

yard, 34 inches wide.

Cheap printed cotton flannel or flannellet is sold considerably for winter dresses. It comes largely from Germany and Austria. It costs about 9½ cents a yard, 29 inches wide, at Constantinople.

Belgian cotton trouserings and suitings, 24 inches wide, costing 91

cents at Constantinople, are sold here to some extent.

Probably half of the cotton cloth worn in the province is of local manufacture, made on hand looms. Thousands of these looms are found in the houses of the poorer people. The cloth is of two sorts, "tireh," a sort of gingham, and "donluk," a heavy unbleached cotton fabric. Tireh is made from imported white cotton thread, Manchester and "Italian," which is colored here. It is woven in pieces about 6 yards long and 19 inches wide, and has 80 to 84 threads to the warp and 50 to 52 threads to the woof. Weight, 6 or 8 yards to the pound. The style and quality made in different towns varies considerably. It sells at  $4\frac{1}{2}$  to 7 cents a yard by the piece.

Donluk is made chiefly from cotton raised in Adena, Harpoot, and other parts of Turkey. Formerly the cotton was spun here with the distaff, but now thread spun at Tarsus and Adena has largely superseded the handmade thread. Some sorts are woven from mixed machine and handmade thread. It is made in pieces about 8 yards long and 15½ inches wide. The number of picks to the inch is 33 by 33, 30 by 34, 30 by 40. Its weight is 7 to 8 yards to the pound, and it retails for 4½

to 51 cents a yard by the piece.

Only the cheapest sorts of cutlery sell here.

Drugs and chemicals.—The drugs are commonly adulterated. Poisons and patent medicines containing substances dangerous or injurious

to life, and chemicals employed in making explosives, are prohibited or admitted under certain control. Considerable sulphate of quinine is consumed here, and a pure article is desired. It is sold by all sorts of merchants and they claim to pay 29 to 44 cents an ounce for it at Constantinople, according to the purity (American prices, 20 to 22 cents, in bulk).

Dyes.—Unfortunately, the cheapest aniline dyes are replacing the solid old vegetable colors, greatly to the detriment of the oriental rugs.

Haberdashery.—Buttons, trimmings, thread, pins, needles, laces, scissors, ladies' and men's furnishing goods, are of lowest grades. The trade is increasing.

Nails.—Owing to great depression in building operations, the import of nails has greatly diminished. Wire nails are used almost exclusively.

Petroleum.—Russian petroleum entirely excludes the American product. It retails here at 13 to 26 cents a gallon, the average price being about 17 cents.

Rice is of local raising. It retails for about 2 cents a pound.

Silk and velvet.—Silks are mostly of native manufacture and oriental in style. An attempt to raise and weave silk was started here this summer. Considerable is raised at Amasia. It is subject to a special tax of 10 per cent ad valorem. Cheap grades of velvet are imported, chiefly for wedding dresses.

Soap is mostly of olive oil, with a large admixture of earthy matter. Spirits, etc.—Alcohol is from Russia; cheap cognacs from Greece and France; beer from Constantinople, Austria, and Germany; wines of low price and poor quality are made at Marsovan, Amasia, and Harpoot. At Tokat they make large quantities of "raki," a sort of brandy made by distilling from fermented pulp and skins of grapes.

Sugar is almost exclusively white-beet sugar, in blocks or cones. Making grape sugar or sirup, "pecmez," is an important local industry at Marsovan, Amasia, Tokat, and Harpoot. Mulberry pecmez is made at Gurun.

Tobacco is under the control of the tobacco monopoly, but 80 per cent of the tobacco consumed, entirely in the form of cigarettes, is contraband.

Woolen goods are rarely pure wool. A large proportion of the woolen cloth worn is of domestic manufacture, "homespun." Woolen yarns are imported chiefly for the manufacture of cashmeres, girdles, tablecovers, and trouserings, at Gurun.

#### NOTES ON EXPORTS.

Nothing is exported directly from Sivas to any country. The export trade is not systematized. If exporting agencies having direct relations with American or European houses were established here, the expenses and profits of three or four middlemen might be saved. Wool, skins, and other agricultural products are sent in small lots to merchants of Samsoun and Constantinople. The cost of transportation by wagons and caravans is high.

Wheat, flour, and barley were shipped in considerable quantities to Samsoun and Constantinople last summer, owing to the low prices reigning here. Wheat was as low as 38 cents a bushel, but every 150

miles of transport doubles the price.

Rugs and carpets are sent mostly to Cesarea, and thence through middlemen at Smyrna and Constantinople to America. Antique rugs are becoming scarce and their value is increasing. New rugs of an exceptionally fine and soft character are made at Sivas, but it is doubtful if they are worth the extra amount of labor expended on them, especially as the colors are mineral and sure to fade. If American carpet merchants would send representatives to Sivas and establish the industry in a systematic manner, manufacturing rugs of the most desirable qualities and patterns, I believe it would prove very profitable. The price of labor is only about one-fourth what it is in the Smyrna region, where so large a proportion of rugs is now made. Wool is cheaper here also, but the cost of labor is the most important item. Girls and women are now receiving 3 to 5 cents a day for this work.

Wool.—I suppose that considerable of the wool finds its way via Marseilles to America. Angora wool is grown here, but it is not equal in fineness and curl to the purer bred wool of the Angora district.

Woolen stockings, knit by hand, were formerly made and exported from here in great quantities, but European machine-made stockings are fast destroying the trade.

#### OPPORTUNITIES FOR COMMERCE.

It would appear that the present political situation and loss of credit by the Armenians might offer an opportunity for American merchants, if they were enterprising enough, to establish a profitable commerce in Anatolia. The old credit system is largely lost; eash would be found to pay for goods if they were brought here. Agents of American houses should come here with samples, study the market, import their goods, and get cash on delivery. The inhabitants of Turkey will not seek American goods, and the American merchant must try to obtain the trade if he wishes it. If some American houses would combine and establish a commission house or resident agency at Samsoun, with a good line of goods to show to customers, they might capture a lucrative trade in Asia Minor.

Prices and measures should be made comprehensible to the oriental buyers. Prices should be quoted to Constantinople or Samsoun, as is done by European merchants, in lire or francs. In that case the merchant will have some idea of what the goods will cost him. The United States will have to learn to use metric weights and measures, which is the system of her competitors.

I receive numerous catalogues of American goods, such as typewriters, carriages, books, mining machinery, pianos, organs, telephones, X-ray machines, and phonographs, which serve to remind a consul that there is a land that is better than this, but I have no chance of securing a single native customer. The goods are not adapted to this country, where only the necessities of life are demanded.

It seems to me that all sorts of American cotton goods might profitably be sold here. Some American sheetings and drillings have a considerable and growing sale, in spite of their higher prices, including numerous profits, from the American cotton grower, through English cotton merchants and mills and Constantinople middlemen, to Sivas weavers and merchants, and notwithstanding the fact that the native cloths are very extensively worn; which would seem to indicate that real merit might win against cheapness and poor quality.

American cotton and wool threads might compete with English yarns. Cheap grades of cutlery, lamps, clocks, and some silver-plated ware might find a market. American boots, shoes, and rubbers ought to be tried; also ready-made calico and linen shirts. Watches, if cheap, showy, full-jeweled, and not too large, with dials in Arabic figures, might sell.

Mixed cotton goods, cheap and of showy appearance, would sell,

but it would seem better to build up and maintain American reputation in honest goods, "all wool and a yard wide." The legend "Made in America" ought to have a different meaning from the common stamp "Made in Germany." Consuls in Turkey have often spoken of the desirability of introducing American thrashing machines, to replace the slow biblical method of treading out the grain with oxen, which is now in use. Attempts have been made to introduce them, and some have been tried. One consul reports that they failed because they cut the straw too fine, another because they did not cut the straw fine enough. It seems to me that the root of the difficulty lies deeper. The thrasher can not thrash grain pulled up by the roots or mixed with stubble and stones, as it is now. The machines soon get out of order. The people have not the mechanical knowledge and appliances required to run and repair the machines. Reapers should precede thrashers. The horses are rather too light to draw reaping machines. Plows and harrows of approved pattern should prepare the ground for reapers, but poverty, conservatism, and the absence of an easy foreign outlet for grain make the present crude agricultural implements seem good and sufficient.

There is a growing demand for enameled ware, which is now supplied by France and Austria in inferior grades. It would seem that American tools should find a market here. Although water power is plenty, there is not a single sawmill in the province, and every sort of carpentering is done by hand, not even by hand-power machinery. The Singer Sewing Machine Company is the only American company which has yet penetrated Asia Minor, and the agent here is being rewarded by a good

and increasing sale of machines.

Wool, hides and skins, rugs, gum, opium, dried fruits, nuts, and apricot stones would constitute the chief articles of exchange for American products. Wool is selling at from 14 to 16 cents for washed and 12 to 14 cents for lambs.

#### RAILWAYS.

No railways exist in Anatolia east of Angora and Konia. They are desired by the Government, and German companies are seeking concessions for building lines from Samsoun or Sinope to Sivas, and for extending existing lines from Angora and Konia via Sivas to Bagdad. The Government, however, wishes roads built on strategic rather than commercial lines, and it is doubtful if an agreement can be arrived at. A line from Angora via Gosgat has been surveyed this summer in the interests of a German company, but as the road would find little traffic in proportion to its length and cost, it is doubtful if they can get the kilometric guaranty they will require.

#### COMMERCIAL SYSTEM.

Almost all commerce in the past has been done on a credit system. Constantinople merchants gave a general discount of 1 per cent on all goods bought. On dry goods they also gave one hundred and twenty-one days' credit from date of delivery, and counted the Turkish lira at 112 piasters instead of its official value of 100 piasters. Manchester gave, through the Constantinople commission houses, from ninety to one hundred and twenty-one days' credit or 3 per cent discount for cash on delivery at Samsoun, lira at 112 piasters. On crockery and glassware Constantinople gave one hundred and twenty-one days' credit and the lira reckoned at 120 piasters. On groceries the credit at Constantinople was ninety days, lira at 112 piasters. Now credits are almost impossible to obtain, and the introduction of a system of cash on

delivery at 3 or 4 per cent discount would probably be gladly accepted, cause a revival of business, and build up a direct American trade. For this responsible local agents are necessary—men who are familiar with American products, and who, if they do not speak Turkish, should know at least French or Greek.

There is no bank in this consular district except branches of the Imperial Ottoman Bank at Samsoun and Trebizonde. Exchange is therefore attended with some difficulties.

MILO A. JEWETT, Consul.

SIVAS, October 10, 1898.

#### SMYRNA.

Since my report of last year there has been little change in the commercial affairs of this city and province. The following table of imports (which is only approximately correct) I have compiled from data obtained through the courtesy of the British consul, who employs each year a man to prepare statistics for him. These are obtained from various sources, none of which are official, since the Turkish authorities here are either unable or unwilling to supply the consuls with any information of a commercial character.

Imports during the year 1897.

Article.	Value.	Article.	Value.
Alcohol. Beer Butter Chemicals Clothing (ready made). Copper Cotton goods. Glassware Hams (cured). Iron (bar and sheet) Lead. Leather	91, 000 69, 000 50, 500 5, 152, 000 218, 000 7, 500 175, 000 5, 000	Lumber Papor and stationery Petroleum Potatoes Rice Rum Sugar Woolen goods Sundries	638, 00

#### DUTIES.

The import duty is 8 per cent, and the export duty 1 per cent ad valorem.

Efforts are frequently made by the Government to establish a law increasing these rates, but "the powers" always object. These rates are in reality increased from 3 to 4 per cent by overvaluation and charging for porterage and other services by the customs officers.

#### AGRICULTURAL MACHINERY.

Germany is rapidly superseding other nations in supplying this country with manufactured products of all kinds, excepting muslins, calicoes, and agricultural implements. She has accomplished this by furnishing "shoddy" goods at a ruinously low price, and by giving credits of from four to six months.

The United States still leads in agricultural implements, especially in plows, harrows, reapers, and binders. Farmers here still object to the American thrashing machine on the ground that it breaks up the straw too much. The Oliver chilled plow, of South Bend, Ind., is the only American plow sold here, and Wood's twine binder leads all other harvesters. It has been at great effort and expense that these implements have been introduced, since all new methods are adopted very

Digitized by Google

slowly. By far the greater amount of plowing in the interior of this province is still done with the old-time "forked tree," and the thrashing is done by means of the tramping of oxen, the thrashing floor being the ground hardened by beating. More American plows have been

sold this season than during any preceding year.

Food supplies are mostly produced in the country, except sugar, which comes from Germany, and rice, which is supplied by India. American hog products are prohibited from entering Turkey by special irade of the Sultan, yet I am convinced many American hams find their way here under English brands. This country supplies plenty of beef for its own use, though the native cattle are very small, but few of them weighing more than 400 or 500 pounds. The butchers make no attempt to cut steaks, but weigh to their customers bones and all. There is a plentiful supply of native mutton of average quality. Sufficient wheat is raised for home consumption, and some years it is exported to the islands of the archipelago. Wheat bread is eaten by the higher classes, while the lower classes prefer a bread made of rye flour mixed with Indian meal. Enough Indian corn is produced for home consumption. It is never fed to animals. Barley is the most profitable cereal raised in this province. It is of a very fine quality and is all exported, almost the entire crop going to England. There is a good average crop of all cereals this year.

Fruits.—The principal fruits grown in this section are figs and grapes for exportation, and lemons and oranges for home consumption. The average fig crop for this province is from 60,000 to 70,000 camel loads of 220 pounds each. Owing to the unprecedented cold of the past winter, the fig crop is now estimated at only 40,000 loads, or a two-thirds crop, while the lemons and oranges will be almost an entire failure. For many years past the growing of grapes for raisins has been one of the most valuable occupations of the farming class. Some six or seven years ago the phylloxera attacked the vineyards nearest the coast, and since then has been gradually making its way into the interior, until now most of the vines have been destroyed in the best grape-producing sections. The ruined vineyards are being to some extent reset with American vines, which in this climate seem proof against the ravages of this dreaded insect. But it will be some years before this section will regain its old-time prestige as a raisin-producing country.

Stoves.—For many years past the cooking in this city and vicinity has been done upon a kind of brick furnace called a range, and the fuel used for both cooking and heating has been charcoal. But owing to an irade of the Sultan last winter the further cutting of timber for making charcoal was prohibited, and that commodity at once arose to double the former price. I saw that this was the opportunity to sell American petroleum stoves, and at once notified our manufacturers through the Philadelphia Museums. I received many catalogues, for it seems the Americans know no other means of introducing their goods abroad. I took some of these catalogues and visited the responsible dealers personally, and finally succeeded in placing them in correspondence with some of our manufacturers. The samples were very satisfactory, but before the stoves could be got here, some European houses, whose agents were on the ground, had shipped and sold vast quantities of petroleum stoves. All were miserable makeshifts and they are now going to pieces. I anticipate a large trade for America in these goods. They must be so constructed as to burn the Russian petroleum without producing a smell, since this petroleum has a much lower refining standard than the American article. The stoyes received from America that give the best satisfaction thus far are the "Ideal" heating stove, manufactured by A. C. Barler & Co., of Chicago, and the cooking stove made by the Cleveland Foundry Company, of Cleveland, Ohio. But I am sorry to say American stove manufacturers have yet to learn how to pack their wares for an ocean voyage. It has been the experience of all dealers here that when American stoves arrive the loss by breakage is out of all proportion to what it should be.

Bicycles.—Though I have done all I could to introduce American bicycles, very few have thus far been sold. If the manufacturers of these articles were as active in sending the goods after they have received an order as they seem to be in supplying the world with catalogues, they might sell more of them. The American wheel is very much preferred, owing to its strength and lightness. All European makes are heavy and clumsy when compared with it; but the Germans have so accustomed the people to cheap articles of all kinds that there is no demand for the higher-grade wheel.

#### INDUSTRIES.

In this city of some 300,000 inhabitants there are very few manufactories of any kind. I have never been able to ascertain how the masses make a living. There are two rolling mills and foundries, a wire nail and box factory, and a factory for making spool cotton. The Government does not encourage manufactories, but seems to throw as many difficulties as possible in their way.

#### RAILWAYS AND STEAMSHIP LINES.

There are two railways connecting Smyrna with the interior. One of them, the Cassaba Line, has connections recently completed which extend to Constantinople. The other, the Ottoman Line, extends to Dinair and Chivril, some 240 miles into the interior. Both lines do a paying business in transporting the products of the country to the seaboard.

The following is a full list of the steamship lines whose ships either touch at or sail directly from this port on regular schedule. The first four named are subsidized mail lines: Compagnie Russe de Navigation à Vapeur et de Commerce, Florio-Rubatino, Lloyd Austriaco, Messageries Maritimes, Compagnie Anversoise, Compagnie Havroise Péninsulaire, Compagnie Orientale (Pantaléon), Compagnie Royale Néerlandaise, Compagnie Panhellénique, Courdji, Cunard Line, Cuppa Lambros, Deutsche Levanté Linie, Fraissinet et Cie., A. C. de Freitas, H. Genestal & Delzous, Glafcke & Henning, Hadji Daout Farkouh, Mahsonsseh, James Moss & Sons, Pappayanni & Co., N. Paquet et Cie., Prince Line, Wescott & Lawrence, Wilson, Khedival Mail.

There is one steamer every week to and from England.

#### REMARKS.

The methods of doing business here are very different from those in the United States. There are few, if any, wholesale or importing houses having capital. The importations are mostly made through the transactions of irresponsible persons, known as "community who visit the stores and take orders."

They get their commission from the manufacturer. When they have made the sale and seen that the goods are delivered, their responsibility ends. They have nothing to do with the collecting. If the buyer does

Digitized by Google

not remit, they leave the manufacturer to get his money either through the efforts of his consul or some attorney. Selling goods on credit in

the Orient is a most hazardous undertaking.

The shopkeepers are frequently dishonest, and litigation is very expensive and results doubtful, owing to the loose manner in which the laws are administered and the conflict of authorities, there being no less than sixteen consular courts independent of the Turkish judicial machinery. It is my opinion that the German manufacturers, who now lead all others in the sale of their wares here, will in a few years, after having pocketed many losses, either abandon the field or sell only for cash.

J. H. MADDEN, Consul.

SMYRNA, July 19, 1898.

#### SUPPLEMENTARY REPORT.

I have consulted a number of leading merchants here in aegard to the exports from and the imports to this port, and am now able to give

a report which I believe is not far from the actual facts.

There has been, in the last twelve months, a very considerable increase in the imports of manufactured goods. This increase is largely confined to articles of German manufacture, but many articles manufactured in the United States have been introduced and are admitted to be of superior quality. There is a tendency among the people here to set up American manufactured goods as the standard of excellency and these goods meet with a ready sale. The chief difficulty in the way of very large consumption of American goods is the The quality of American goods being better, an advance in price is expected, but unfortunately the conditions governing importation from America are such that the price is often disproportionate. These conditions are chiefly the greater distance and consequent higher rate of freightage. The terms made by American manufacturers are also not so liberal as those of the German, French, and English. The European manufacturers usually allow from three to six and often nine months for payment, while it is the rule of American houses to draw in full upon delivery of goods on board ship. The necessity of this arrangement is apparent in the case of American manufacturers. because very few are represented here by agents, and the difficulties surrounding collection are manifold. European mercantile houses have for many years had their representatives and agents here who advise concerning credit. A further difficulty under which American trade must labor is the indirect method of shipment, there being no direct line of communication between this port and any port of America. This, of course, necessitates transshipment, usually at Liverpool, and the rate of freight is about doubled thereby. The establishment of a line of steamers plying monthly between New York and the ports of Turkey would undoubtedly open to America one of the largest markets of the world. The difficulties in the way of opening such a line are many, but the volume of business at present would indicate its feasibility, and the business thus begun would quickly double.

There are many articles necessary to American social economy

unknown here which need but to be seen to be appreciated.

American cotton goods have long been in the market here, but are bought in England of English agents, thus giving away a very considerable commission which should be kept at home, and making the price to the consumer so great as to materially lessen their consumption.

This is true of many other articles.

The opportunity for importation of American agricultural implements and household furniture is neglected by manufacturers, or the trade is carried on only to a limited extent. The same may be said of carriages. American sewing machines and bicycles are meeting with deserved success.

The reputation which Americans have of not properly packing their goods for ocean voyages would be greatly improved by direct communication. I am convinced that the transshipment at Liverpool is largely responsible for the great amount of breakage which occurs.

#### AGRICULTURE.

Food stuffs are produced in abundance here except sugar, coffee, and rice.

Beef is plentiful, but of very poor quality. Mutton is abundant and excellent.

The wheat crop is usually ample for home consumption, but when short, wheat is imported from Russia as flour. Barley of excellent quality is raised in large quantities, and the entire crop is exported. Indian corn is very poor and not abundant. This is caused, first, by the seed, which is poor in quality, and, second, by the primitive cultivation. After once being put in the ground corn receives no attention until harvested.

Fruits are grown in great variety and are of the finest quality.

Figs, raisins, and grapes are exported.

An average fig crop for the vilayet of Aidin is 70,000 camel loads of 200 okes (566 pounds) each. The crop of figs in 1898 was about one-quarter of the average, owing to the intense cold of the preceding winter. Eighty-five per cent of all figs raised go to the United States. The grapes and raisins have been greatly reduced by reason of the "phylloxera." The American vine is said to withstand this disease, and experiments are now being made with a view to introducing it.

#### WEAVING.

Manufacturing is carried on in Smyrna only to a very limited extent. In the interior, however, carpets and rugs are made in large quantities, and afford support to thousands of weavers. These carpets are made by hand, the weaver receiving 2 piasters (8 cents) per day in some cases, but usually labor is paid by the square pike (709 square inches), the price varying according to the figure. A good weaver can seldom make more than 10 cents per day.

#### TRANSPORTATION.

There are two railways connecting Smyrna with the interior. One runs northeast 240 miles, the other southeast 200 miles. They are owned and controlled by English and French capital, and the service is good. Freight rates are one-third higher than on American roads. This is owing chiefly to the flat cars, which are very small and run upon four wheels instead of two sets of trucks, as do American cars, and to the necessity of bringing railroad coal from England by ship. The price of coal varies greatly, often being \$9 and never less than \$5 per ton. Anthracite coal is unknown.

#### COTTONS.

A matter which should receive the attention of American exporters

is the import of cotton goods.

The average annual imports of American cotton goods into this market via England and through English firms, who get a commission of from 3 to 5 per cent, consist of some 300,000 pieces, of a value of \$695,200, divided as follows:

	Pieces.	Value.
Cabot	160, 000 80, 000 60, 000	\$323, 840 176, 000 195, 860

American manufacturers should send agents directly into Turkey, as is done by manufacturers of other nations.

#### TARIFF.

The rate of customs duty on imports is 8 per cent ad valorem; that

on exports 1 per cent ad valorem.

For quay dues a special tariff is issued for each article. In general, however, manufactured articles are charged 4 cents a hundredweight, raw material 1 cent and less per hundredweight, according to its nature and value.

The quay dues on a few of the principal imports are as follows:

	Cents.
Alcohol	
Coal	
Cotton goods	
Iron	
Paper	do 5 <del>1</del>
Petroleum	DAT CASA.
Rice	per bag 3
Sugar	per cwt 3#

RUFUS W. LANE, Consul.

SMYRNA, January 10, 1899.

#### SYRIA.

#### ALEXANDRETTA.

In transmitting a report of commercial relations for the year closing July 1, I beg to say that as statistics are not obtainable from the customs the returns, later given, of foreign exports and imports must be regarded as approximate, since they are compiled from information obtained through the courtesy of the various steamship agencies and commission merchants.

Government currency, banking facilities, and commercial credits were dealt with in a similar report of last year, as were steamer connections and freight rates. These points remain unchanged.

The price of wheat varied in the past year (July to July) from 145 market piasters per shumbul (in round numbers about \$1.60 per bushel) to

its present and lowest price of 85 piasters per shumbul (about 99 cents per bushel).

The price is falling constantly. For a short time during the winter the exportation of wheat was prohibited, disturbances over the price of

bread having arisen.

The filling of the marsh progresses favorably, and will be much facilitated by the use of a locomotive which was especially built in England for the purpose and has just arrived. There can be no reasonable doubt that should the injurious effects of the marsh be done away with, Alexandretta, with its natural harbor (the only one on the Syrian coast) will become a port of great importance.

I give an approximate estimate of exports and imports, and a com-

parison with the totals of last year:

Approximate estimate of imports for year ending June 30, 1898.

a Dirty.

## HORACE LEE WASHINGTON, Consul.

ALEXANDRETTA, September 18, 1898.

#### BEIRUT.

I submit the following as my annual report from this consular district. As the ground has been thoroughly covered by my predecessors and in many instances no material change has occurred, I take the liberty of

indulging in a few digressions.

This consular post has in the past derived, and it still derives, its chief importance from the protection it offers resident American missionaries and American tourists. My consular district, after the establishment of an independent consulate at Alexandretta, embraces the vilayet of Beirut, which means the coast from and including Latakia to and including Haiffa, also the mutasarafiat of Lebanon and the vilayet of Syria, the latter with headquarters at Damascus.

#### MISSIONARY INTERESTS.

Within the limits of this consular district the American Presbyterian Mission in Syria has been pursuing its noble work along educational and charitable lines for nearly half a century. At the present time, according to a financial report courteously furnished me by Rev. Dr. H. H. Jessup, elerk of the mission, the sum of \$604,775 represents the amount of American money invested in this district in connection with the missionary work, distributed as follows:

Beirut station	\$410,000
Aleih station in Lebanon	36 085
Sidon station and district Tripoli station Fakleh station in Lebanon	73, 585
Tripoli station	31, 875
Fakleh station in Lebanon	23, 230
Damascus	5,000
Damascus Latakia station (estimated)	25,000
•	

As new improvements or enterprises started in the year ending June 30, 1898, may be classed the purchase of three tracts of land by the Syrian Protestant College and the erection of a carpenter shop in connection with the industrial school at Sidon. Considerable additions

Digitized by Google

have also been made to the college apparatus, including a seismometer

(earthquake measure).

Altogether there are in this district in active operation nearly 150 American schools, including 1 college (with preparatory, collegiate, and medical departments; 20 professors and instructors, headed by Rev. Dr. Bliss, average attendance 350 students); 2 boys' boarding schools, 5 girls' seminaries, and numerous day schools.

There is but one purely American hospital to be mentioned, that of Dr. Harris, in Tripoli. Dr. Mary P. Eddy does itinerant medical work in the towns and villages throughout the interior. The American medical professors in the college are the physicians of the German hospital of the Knights of St. John, in Beirut, and treated during last year 545

indoor and 11,816 polyclinic patients.

The whole number of Americans—men, women, and children—in this consular district, including missionaries, professors, doctors, and press agent, also resident Americans not connected with missionary work, at Haiffa, Saffed, and Tiberias (the property of the latter consisting of houses, lands, soap factories, mills of various kinds, having an estimated value of \$100,000, being omitted from the above financial statement), is, as nearly as I can discover, 210, of whom more than one-third are men over 21 years of age. Nearly all American citizens in Syria are men of high breeding and splendid training, and reflect honor upon our country.

#### AMERICAN TOURIST TRAFFIC.

Hundreds of Americans have passed through Beirut during the last year, some on their way home from Jerusalem or Damascus, others bound for the interior. A gratifying number of these tourists called at the consulate, either to pay their respects, or to ask for mail, general news, or some specific information. Sixty-one tesperes or traveling permits were issued during the year by the vilayet upon application from this consulate. Special American tours of the Holy Land and Syria were arranged and successfully carried out as follows: North German Lloyd steamship Aller, Beirut, March 13, 350 passengers; English yacht Midnight Sun, Beirut, March 20, 120 passengers; North German Lloyd steamship Augusta Victoria, Beirut, May 3, 330 passengers. Tourists who visit the Levant in the spring of the year generally start from the south, proceeding from Alexandria or Cairo via Port Said, Jaffa, Jerusalem, Damascus, Beirut, and Cyprus to Constantinople or Athens. Autumn tourists will adopt the same itinerary, only reversing the order of things and opening their campaign in the north. Railroads from Jaffa to Jerusalem and from Beirut to Damascus facilitate traveling considerably. Tourist agencies, such as Clark's, Floyd's, and Cook's predict an exceptionally large influx of Americans to the Levant during October, November, and December next, perhaps attracted more or less by the visit of the German Emperor.

#### COMMERCIAL RELATIONS.

As will be readily observed by reference to the annual statement of imports and exports issued by this consulate, there has been a notable increase in the commercial dealings between this port and the United States. But it is only a very faint indication of what might be accomplished if there existed a direct steamship line between New York and the Levant.

I sincerely hope that Mr. Dickinson, the consul-general of the United States at Constantinople, who is now endeavoring to enlist the services of some steamship company in this trade and who is being effectively backed by all United States consuls in the Levant, will succeed in his efforts. Only through the establishment of regular direct communication is it possible to arouse Mediterranean trade with the United States from its lethargy. I have placed in the possession of the consulate-general all obtainable information in regard to weight and value of such business as might reasonably be counted on from the start at this port by a steamship line as proposed.

The total imports to Beirut from all sources for the year ending June 30, 1898, amounted to \$8,258,300, as against \$7,454,060 for the year 1896-97 and \$6,659,400 for 1895-96. Only \$57,289 of the total amount is to be credited to the United States (\$47,540 for the year 1896-97 and \$41,050 in 1895-96). England supplied the market during last year with cotton goods to the amount of \$3,041,500 (\$2,650,000 in 1896-97)

and \$2,100,000 in 1895-96).

No American merchant vessel has been seen in these waters for years, while during last year alone 659 steamers and 1,957 sailing vessels arrived at this port flying British, French, Austrian, Russian, Norwe-

gian, Greek, or other colors.

All United States consuls in the Levant are emphatically of the opinion that a lively trade with America would spring up as a result of direct transportation facilities. For my part I am deeply impressed with these possibilities, and I cherish the hope that before long this consular district will be doing a largely increased business with the United States.

Beirut is the chief seaport town and market place of Syria and Palestine, and her commercial fame is growing. Among the cities of the eastern Mediterranean coast Beirut ranks next to Alexandria and Smyrna. May the day not be distant when the large and patriotic American colony at this place will be permitted to see the Stars and Stripes waving from the mast of some merchant vessel in its harbor.

Among the articles of export mentioned in the annual statement raw silk does not appear, although the bulk of the Syrian silk product, some 900,000 pounds annually, goes to the United States. It is, however, first shipped to Marseilles, thence transferred on cars to Lyons, and after being marked there, finally sent to the United States, at a much increased cost to American importers and manufacturers. It is supposed that Lyons offers certain guaranties as to evenness of the thread and keeping of contracts. But closer commercial relations with Syria, resulting from direct steamship connections, would, I believe, soon eliminate the necessity of going to France for a certificate of the quality of the Syrian silk product and of the trustworthiness of Syrian exporters.

## GERMAN EFFORTS.

Perhaps no country displays more activity and energy just now in attempting to obtain control of the Levantine markets than Germany, and it is evident that the commercial influence of that country is growing in both Syria and Palestine. In this connection it may be pertinent to remark that a new German monthly magazine, perhaps subsidized by the Government, saw the light of day on May 1 last under the name of Der Orient. Half of it is printed in French, in order

¹ On February 15, 1899, Consul-General Dickinson wrote the Department of State that he had succeeded in inducing Messrs. Barber & Co., of New York, to start a direct steamship line to Turkey. See Advance Sheets No. 376 (March 17, 1899).

to better reach the peoples of the Levant, where French is the prevailing language. I quote from the opening article:

Der Orient aims to strengthen and extend the mutual relations of Germany and the countries of the Levant. It will contribute to the better understanding of political and commercial conditions in those regions, combat ancient prejudices among the Orientals, and prove to them that we Germans have no political axes to grind in the Levant, but simply desire to be allowed to appear on the stage as unselfish friends and as pioneers of Western culture. Der Orient will attempt to increase German imports into the Levant as well as the exports from there to Germany, and it will strongly advocate the solidarity and authority of Turkey and the Balkan States, which is possible only by developing the natural resources of these countries. We furthermore expect to offer those who intend to visit these wonderful lands information, advice, and assistance.

Accidentally I heard of this new publication, and I subscribed for it, in order to get the benefit of German strategy in this particular field. Der Orient is a very creditable magazine.

The following extracts from the same, expressing opinions, which I indorse, may be of some value to American manufacturers and exporters:

On account of prevailing economic conditions in Turkey, it is more than ever the price, not the quality of goods, which is of paramount importance. Articles intended

for the great masses must above all be cheap.

A sample house should be established in all the principal cities of the Levant, not as a private undertaking, but as a result of united efforts on the part of boards of trade. A trustworthy salesman should be placed in charge of each shop and the stock increased in proportion to the reported sales.

In the Orient it is especially gratifying to the buyer to be permitted to examine the

goods in natura.

"

. .

f:

i

Commercial travelers sent into the Levant must be familiar not only with the French language, but also with the customs and traditions and prejudices of the people, as well as the needs and wants of the markets.

If our consulates could be furnished with commercial attachés, whose business it would be, independent of usual red-tape operations, to assist our commercial travelers, these would return with better results. Catalogues are of little value.

### SYRIAN EMIGRATION.

Under strict orders from Constantinople, Syrian emigration is prohibited. Nevertheless, some 200 or 300 Fellahins from the Lebauou mountains leave this port every week for America mostly by French steamers. I have paid some attention to this traffic, and I am inclined to believe that in this instance the United States is being to a certain extent victimized. To be sure, the emigrants after reaching Marseilles or Havre are subjected to an examination before they are allowed to depart for America, but I am reliably informed that this examination is by no means rigid, and thus a very difficult task is given our inspectors in New York. The Syrians, who generally travel in flocks and as a rule manage to have a capitalist or two in each party, make a practice of dividing up their ready money so as to be able to prove that they are not indigent, this arrangement of course being only a temporary one. Others go to Brazil and from there gradually find their way into the United States.

It would be far better for the Turkish Government, realizing that its orders prohibiting this emigration can not be enforced, to exact a tax per head, for instance, and allow emigrants to depart freely. If the present orders were rescinded and direct steamers started, most of this emigration could be controlled through this consulate, where the emigrants are better known individually and as a class, and where, if necessary, proof of their representations could be more easily secured.

As it is, our emigration laws do not seem to operate quite satisfactorily. If the examinations required were conducted primarily by the consul, in conjunction with a physician designated by him instead of by the steamship company, better results might be obtained.

Syrian emigration to America is only of recent date. In 1878 the first Syrian to emigrate to America with his family, Joseph Awad Arbeely, left these shores. It took several years before the movement became general. Now the number of Syrians in the United States is estimated at 30,000. Most of them become American citizens and remain in the land of their adoption, although paying occasional visits to their old home. Having emigrated in spite of prohibitory Turkish orders, they are not fully recognized as American citizens by the Sultan, and Turkish consuls in New York, Marseilles, and no doubt elsewhere frequently refuse to visé their American passports. Returning here, even if only for a short stay, these naturalized Americans are importuned and harassed in various ways, and are compelled time and again to appeal to their consul. Some of them, being aware of the difficulties ahead of them, manage to obtain a Turkish passport, most frequently, I believe, in Alexandria, and land here with a Turkish passport in their hand and an American passport in their pocket. From this it will be seen that the present arrangement offers a premium on fraud and repudiation.

## GENERAL REMARKS.

Generally speaking, the year just closed has been a favorable one for Syria, and its people are enjoying as much prosperity as can be expected. I do not look for any sudden or radical change in their fortunes; but foreign influences constantly at work will gradually improve their economic condition and their tastes, and in time develop a better market for American and European goods.

As it is, cotton goods constitute, as far as this consular district is concerned, the chief article of import. This trade is now monopolized by England, but it is probable that with direct steamship connections the American product could compete successfully with that of the Manchester mills. Until these transportation facilities are acquired little progress can be made. I have reason to think, however, that American tools would find a market even now.

Prestige goes a long distance in the Orient toward gaining trade, and the successful conclusion of the war will give our country a standing never before attained in the eyes of these people. This advantage should be followed up, and as many agencies as can be conveniently directed and controlled should be drawn into service.

But, I repeat, without direct transportation facilities we are nearly helpless. We may succeed in the near future in engaging the services of some English or Dutch steamship line, but this is not intended to imply that we shall be less eager and earnest in our wishes for the restoration of the American merchant marine.

G. BIE RAVNDAL, Consul.

BEIRUT, July 30, 1898.

## SUPPLEMENTARY REPORT.1

Syria during the last year has been favored by Providence in various ways. No serious disturbances have occurred, and the life and property of the people have enjoyed comparative safety. With the exception of a period of unusually inclement weather last winter, which destroyed many flocks of sheep in the Hauran district, no special

<sup>&</sup>lt;sup>1</sup> In reply to circular of August 5.

calamity has befallen its industries. Crops and prices have been fair, and the tourist traffic perhaps never before reached the proportions of

last year.

Through missionary societies, returning emigrants, and commercial agencies knowledge is being constantly disseminated concerning modern conditions of life, and the native standard of taste is changing. Veteran missionaries well remember the time when there were not more than six glass windows in the city of Beirut, and when in the village houses there was no furniture worthy of the name. To day one sees the comforts and conveniences of our modern civilization every-In Beirut, according to Prof. Samuel Ives Curtiss, D. D., there was, forty-two years ago, one little day school for girls and another for boys, also a few Mohammedan schools in the mosques for teaching the boys the Koran. Now there are not less than 15,000 children in schools, out of a population of something over 100,000. Mohammedans are sending not only their boys but many of their girls to school, thus changing their customs and ideas. It is gratifying to know that the American mission in Syria, with its college, has contributed largely to this transformation.

While it is true that this yielding to modern impulses creates a growing demand for American and European products, it is also true that people here are generally poor, and that the Government concerns itself

very little about improving their lot.

The extent of the progressive movement above indicated may, perhaps, be measured by the increase, during the year ending June 30, 1898, in the value of the imports to Beirut of \$804,240. During the same period the value of the exports from Beirut increased by \$135,400. The imports last year to Tripoli, a neighboring city, amounted to \$4,850,000, an increase over those of 1896-97 of 13\frac{1}{2} per cent, and over those of eight years ago of 49 per cent.

Tables herewith inclosed will more fully show the movement of trade

in Beirut.

It will be noticed that the local trade with the United States is growing, but that outside of sewing machines the imports from America do not amount to a great deal. This is not at all due to a lack of appreciation of the greater excellence of various lines of American goods, but to their higher price, which is a result principally of the cost of transportation swelled by transshipment expenses. With direct steamship facilities many lines of American products of field and factory would find ready sale in Syria and Palestine, especially hardware, hand tools, pumps, corn shellers, fanning mills, cotton prints and drillings, canned provisions, furniture, watches and clocks, leather and saddlery, drugs and paints, kerosene, and flour.

In support of this opinion I beg to submit some extracts of letters from representative Americans residing in different localities within

the limits of my consular district, as follows:

\* \* More direct communication between the Levant and the United States would, in my opinion, be of far-reaching benefit. Such a line would tend to open a market for many American manufactures and products which are now kept out, chiefly on account of the high freight rates consequent on a circuitous route. Hardware, tools, and food products could easily compete with those of Europe if freight rates were not so high. In our own line we find that we could bring most of our printing paper from America at a price even below that obtainable in Europe if the freight rates were more favorable. I trust everything possible may be done toward establishing more direct communication. This American mission receives, on an average, about 100 cases per year (75 tons) from New York of miscellaneous goods.

E. G. FREYER, Manager American Press, Beirut.

\* It seems to me that a market might be eventually found in Syria for some or all of the following (American) articles, providing freight rates were low enough: Flour and prepared cereals, preserved meats (now imported to some extent from America via England), and other canned goods, lumber and furniture, safes, tools, and certain other articles of hardware. A great difficulty arises in the unwillingness to pay good prices for good articles, cheapness being the greatest factor in the local market.

ROBERT H. WEST. Professor, Syrian Protestant College.

Perhaps (American) cotton prints and drillings would gradually create a demand if the price were put down to Manchester rates. Machinery to a limited extent, such as sewing and knitting machines of American make, can be sold here.

> Rev. O. J. HARDIN, Tug-el-Gharb, Mount Lebanon.

As to what kind of American merchandise might, under more favorable transportation conditions, find a good market in Syria, I will give you the results of my experience and observation:

1. Iron windmills for pumping water, to replace the old turnstile arrangement with

wasteful bucket, etc.

2. Clean lumber, especially pine flooring; but most important of all, and perhaps the best for shipment, are certain kinds of hardware, and I give you the results of some special inquiry. It will not do to send out lots of general hardware; it must be picked and packed for the trade here.

3. Hardware: Galvanized carpet tacks—none in Syria; double-pointed tacks—none in Syria; gimlet-pointed screws—all European makes are without the "gimlet," unless changed recently; files, especially three-cornered saw files (I have brought out grosses of these for friends); handsaws of all sizes and shapes; good augers (the European augers are very poor); braces; bits of all sizes; American axes and hatchets (where handles are not sent let makers put in a full-size paper pattern with each ax); carpenters' hammers (my American hammers have been copied a dozen times by machinists here); pickaxes, with paper-pattern for handles; cut nails, as against wire nails; strap hinges—none in Syria; butt hinges—none in Syria; door locks, closet locks; doorknobs, earthen and wooden; copper rivets, all sizes—none in Syria; copper wire; crosscut saws; wedges for splitting—none in Syria; pocketknives, ring and chain attachment; seissors, with four finger grip; razors; pressed tinware, basins, etc., that will slip inside each other and pack well; galvanized iron water kettles; drawer pulls, plain and fancy; handmills for grinding corn, breaking wheat,

etc.; cheap wooden chairs.

I do not see much room yet for agricultural implements; they involve great changes. Syrian animals can not pull American plows. Fields, as a rule, are too small for reapers. Thrashing machines would spoil tibu for cattle food. Changes

will come in time.

An American agent here could take native tools, improve them in shape, and make them cheaper and better,
Where hardware must fit into other work, for example mortise locks, it ought to

be by centimeter measure.

Rev. F. E. Hoskins, Zahleh.

\* \* If steamers should call at the port of Sidon they will pick up a very considerable local trade to supplement their through shipments to the United States. and also receive many orders for American manufactures if direct communications are established.

GEO. A. FORD, D. D., Sidon, Syria.

\* \* After consultation with native merchants and independent study of the markets, I find a demand for the following articles of United States manufacture: Paints, pumps, agricultural machinery, sewing machines, cutlery, nails and all kinds of hardware, rubber goods, cotton cloth and calico, watches and clocks, canned provisions, drugs, confectionery, stationery, furniture, and possibly flour and lumber.

Dr. IRA. HARRIS, Tripoli, Syria.

\* \* The imports at present consist of dry goods of all varieties, both cotton and woolen, American sewing machines, drugs, dyestuffs, paints, leather, etc. American tools for use in the trades ought to find a ready sale if introduced, also petroleum. Canned goods would have a limited sale. Iron nails and hardware of all sorts would be in demand if put on the market. Granite ware is being introduced.

JAMES M. BALPH, D. D., Latakia, Syria,

In this connection I beg to submit inclosed reports from our consular

agents at Haifa and Damascus.

No complaint has been heard in this market against any particular deficiency in American methods of packing goods. The chief obstacles in the way of our products are their greater cost, as above explained, and the more liberal terms, such as long credits allowed Syrian customers by European houses. Germany seems to be in great favor at present with Turkish importers and purchasing agencies, but there are unmistakable signs of an impending collapse of this boom. The inferiority of the cheap imitation goods with which German exporters flood these markets is too apparent.

Cotton goods were imported to Beirut during the last fiscal year to the amount of about \$4,000,000, of which \$3,041,500 went to England. They form the principal article of import all through the Levant, and the question whether or not the United States can successfully compete in this trade is an important one. At present no American cotton manufacture reaches this market, except 60 to 70 bales annually of heavy duck or canvas called "American file," used for sails and shoe cloth. The bulk of the cotton textiles consumed in this market falls under the head of Manchester goods, of which the varieties offered are without number, there being sold in the way of prints alone hundreds of different qualities, colors, and designs.

The leading cotton fabrics in the local market are unbleached calico, bleached calico, and printed calico, all from Manchester, England, as

follows:

Trade name.	Length.	Width.	Weight.	Price.	Value in United States currency.
T Cloth:	Yards.	Inches.	Pounds.	Piasters.	
McClure	24	24-36	4-8	a 4 h	\$0.1590
Mexican	24	24-40	7-12	a 5	. 1767
Inferior	24	24-36	4-9	a4	. 1414
Shirting	873	31-54	7-15	b 28 to 65	\$0.9895 to 2.2971
Bleached calico	24 87 <del>1</del> 39	32-37		b40 to 120	1. 4136 to 4. 2408
Sheeting	50-60	2 yards .	1	c2 to 41	.707 to .1555
Prints	30 <del>-4</del> 5	27-32		ci to 5	.353 to .1767

a Per pound.

b Per piece.

c Per yard.

The market piaster has an average value of 3.534 cents.

Most of the muslins, scarfs, sashes, handkerchiefs, towels, napkins, belts, stockings, head coverings, and clothes of different sizes for the peasants are imported from Germany, Switzerland, and Austria. Every merchant with whom I have conversed about the introduction of American cotton textiles has invariably pointed out the necessity of sending salesmen or commercial travelers here to show them the goods. The Manchester fabrics as sold here are manufactured with an eye to the Syrian weakness for cheap and showy things. As matters stand, I see little encouragement for American enterprise in this field. The West Indies, South America, China, and Japan no doubt offer better opportunities for profits to our manufacturers of cotton textiles. But with direct steamship connections, this market would have strong claims upon American attention.

G. BIE RAVNDAL, Consul.

### REPORT FROM HAIFA.

There was little change in the trade situation until the end of June last, but since then a revival is observable, manifesting itself in the increased imports of hardware, dry goods, and machinery, and in the

export of grain.

If direct steamship facilities could be secured with the United States, a notable increase in the commercial dealings would doubtless take place. Although Haifa and Acca are small towns of 12,000 to 15,000 inhabitants, there is a notable demand for American beef (canned), dried apples, lard, agricultural machinery, and especially for hardware and dry goods; also for American saddlery ware; but with few exceptions all the articles are imported through Germany and France, and the freight dues thus amount to one-third of the market price of the imported article, making it nearly impossible for a merchant to compete with other products. The superiority of manufactures of the United States is a well-known and admitted fact in my consular district, and import firms are ready to take American products as soon as the freight rates are reduced.

The kinds of American goods sold in Haifa by the American firms Struve & Beck, Kraiss & Son, and the large German firm A. Dück & Co. are hardware (hoes, shovels, forks, hatchets, hammers, carpenters tools, and meat-cutting machines), canned goods (apples, beef), crackers, lard, saddlery ware, saddles, harness, bridles, stirrups, and tools and outfits, canvas, oilcloth, dry goods, linen, "factory" shirting, etc.

GOTTLIEB SCHUMACHER, Consular Agent.

HAIFA, August 17, 1898.

### REPORT FROM DAMASCUS.

I have attempted by various means to obtain from the railway company a statement showing the exports from Damascus for the year ended June 30, but have hitherto been unsuccessful, as there exists a strict prohibition against giving statistical information.

I have, however, been informed by some merchants that the approximate estimate of exports during that period was a little over \$2,000,000, consisting principally of silk and cotton fabrics, wool, brass, and inlaid work, skins, guts, ropes, apricots, kernels, raisins, flour, and grain. Of

these articles \$118,188 worth were to New York, as follows:

91 bales of oriental goods	<b>\$40, 434</b>
1,569 bales of wool, weighing 2,5851 tons	77, 754
•	
Total	118, 188

This amount exceeded the preceding year by \$8,000. Other exports

were shipped to England, France, Germany, Italy, Austria, etc.

The total value of imports was over \$3,000,000, consisting principally of cotton yarns, cotton prints, woolens, silk and cotton fabrics, indigo, sugar, rice, copper, brass, leather, hardware, drugs, earthenware, and glassware from the countries above mentioned, and petroleum from Russia.

Direct steamship facilities will increase commercial relations between

this country and the United States.

Agricultural implements of moderate prices, for plowing, reaping, etc., will be saleable in this province if manufacturers are represented by a person with samples who can explain their operation and advantages.

Business is generally stagnant, owing chiefly to the lack of rain and the severe cold during last winter, which destroyed a considerable number of cattle and fruit trees and occasioned a great deficiency in

cereals.

NASIF MESHAKA. Consular Agent.

DAMASCUS, August 27, 1898.

### PALESTINE.

The amount of exports and imports for this consular district do not vary greatly from year to year. Every year, however, when the conditions are normal—that is, when there is no cholera, quarantine, or war—shows a fair increase over the preceding year. The introduction of American goods likewise increases yearly, but the exact amount or per cent of increase it is impossible to tell. Digitized by Google

In the absence of tabulated statistics, which the Turkish authorities have not yet seen fit to furnish us, I will mention a few matters which seem to me to concern American trade and commerce, and also some of general interest.

A German merchant here imports American tools, but buys them in Hamburg, whence they are reshipped to Yafa (Jaffa). At present the amount is limited, but he assures me that they are favorably received and that there is an increasing demand for them. He mentions especially machinists', carpenters', and blacksmiths' tools. He also imports

some carriage wheels ready made.

This leads me to remark upon a branch of business which ought to be in American hands—namely, carriages and carriage supplies. Ten years ago there were very few carriages in Jerusalem, but now that the Yafa road is in good condition and the road to Jericho, the Dead Sea, and the Jordan is opened up—also that to Bethlehem and Hebron—there are scores of carriages, and the number is constantly increasing. A carriage road has recently been constructed from Jerusalem to the top of the Mount of Olives (for the German Emperor, it is said), and in a few years one will be built between Jerusalem and Nablous; hence it is reasonable to suppose that the demand for carriages will increase. The carriages should be made in the United States—at least, the wheels and running parts, and shipped in that form. Some good workmen should be sent here to establish repair shops, since all work of that kind is done in a rude manner by natives.

No one can say that direct communication with New York by steam would at first be a paying investment, but it would be welcomed by the merchants of this country, and the representatives of the United States in this part of the world see reasons convincing them that the outcome

of such an undertaking would in time be highly satisfactory.

Only a few years ago there was no direct communication by steam between the United States and Egypt, but the North German Lloyd Company made the experiment, and now the steamers between New York and Alexandria are, during the season of travel, frequently crowded with passengers. The success of the enterprise showed that a certain field had previously been unoccupied which was ready to

reward anyone who should venture to work it.

Our vice-consul here, who was born in New England but has lived nearly all his life in this country, is of the opinion that if a purely American store were established in Jerusalem it would very soon create a considerable demand for American goods. He believes that such a store would be a profitable investment. It should be stocked with a variety of goods, and reference always had to the actual and possible needs of the people. Jerusalem should have a central store and depot, while branch stores should be established in the principal cities and towns of the province, such as Yafa, Gaza, Hebron, Bethlehem, Nablous, and Salt, which is east of the Jordan. The nature of trade, certainly in the branch stores, would for some years be chiefly a barter trade. Although large fortunes and wealthy firms have in the past been built up in this way, I feel at the same time that this method of creating business is distasteful to great numbers of modern American My reason for this statement is this: Our manufacturers and merchants have from time to time addressed this consulate relative to the possible introduction here of their specific line of goods, and I have taken pains to inquire and make reports and suggestions as far as was in my power. The replies have been in the curt form, in some instances without any expression of gratitude, "We want only cash orders." My efforts were futile; and it seems to me that I have reason for giving expression to the criticism that "fine clothes, a fine office, fine cigars, and cash orders" illustrate a prevalent style of doing business with too many American firms. The markets of Syria can never be opened or made available by business men of that class, but the men who are willing to do a little mercantile grubbing and pioneering here will after a time largely control the trade of this part of the world.

Such canned goods as corned beef, ham, tongue, salmon, lobsters, oysters, milk, sweet corn, lard, berries, and such other fruits as do not grow in Palestine; also furniture in pieces to be put together here, window frames, blinds, doors, etc., ought to be sent here from the United States. This is, of course, only a partial list. Personal testimony is to the effect that English-prepared ham, tongue, fruits, and some other goods that come in cans are not so good as similar articles that are prepared in America. So much fruit is preserved in this country for winter use that the introduction of American glass jars would be a blessing. As soon as the people become accustomed to them, there would no doubt be a large demand. Fifty to sixty thousand bottles of beer are imported into Jerusalem every year, and a large part of this trade might be in American hands.

One merchant ventured to import a small invoice of American-made ladies' shoes; they were taken at once, and there is a call for more.

English ladies who tried them were highly pleased with them.

In every case when I introduce the subject of American goods to the merchants of this city it is admitted that in general they are superior to those of the same kinds from other countries, and the merchants say they would like to keep them for sale; but the expense of getting them to Jerusalem is the great barrier. The consul is not the person to remove this barrier; this should be done by action taken in the United States. Occasional visits to this coast of American steamers, and a central store with branches, as suggested, seems to be one way of securing to the United States its share of the trade of this country.

## NO "ENGLISH STORE."

Most of the canned or "tinned" goods used here are made in England, and a considerable quantity of cloth and other articles are from the same source; still there is no "English store" in Jerusalem. An exception should be made of one dry-goods store, where, although most of the goods are bought in England, many of them are marked "made in Germany," so that the experiment of a wholly English store can not yet be said to have been thoroughly tried. It seems as though there might be one since steamers engaged in the orange trade come direct from Liverpool or London twice a month from November till March, and throughout the year the Prince Line sends occasional steamers to African and Syrian ports, so that the facilities for shipping English goods to Jaffa are good. Jaffa, it is well known, is the seaport of Jerusalem.

### FUEL.

The engines on the railroad between Jerusalem and Jaffa burn coal, and besides the amount thus consumed about 3,000 tons are imported every year for consumption in other ways. One of the largest flour mills in Jerusalem burns only wood, because thus far, the owner claims, it has been found cheaper to do so. Another large mill burns coal only. Were coal as fuel cheaper than wood, one would suppose that the

hotels would employ it, but they continue to burn wood. It is used in the kitchen chiefly, since guests require their rooms warmed only occasionally during the rainy season. A few private familes experimented with coal, but it was dirty to handle, and another objection was its unpleasant odor, consequently wood was reinstated in popular favor.

Coal is brought from Belgium in pressed blocks, which are 9 inches

long, 6 inches wide, and 6 inches thick.

Meantime wood is becoming dearer every year, and the hills that not long since were partially covered with a stunted growth of bushes are now entirely bare, because the roots of trees and shrubs have all been dug up to supply the market with fuel. What is called "wood" in Jerusalem would in America never be offered for sale, but left on the ground to be burned or to rot. Here every limb and every root is carefully saved and brought into the city on the heads of women or on the backs of donkeys or camels, and finds a ready sale at about \$1.50 for 600 pounds (a cantar), stones, sap, and dirt being included in the weight of the wood. In the nature of the case, the supply of fuel from the present source can not go on indefinitely.

The Grand New Hotel, the largest in the city, consumes about 250,000 pounds annually. A small German family requires about 12,000 pounds, a larger family will require 18,000 pounds, and some as much as 24,000 pounds. One small German bakery uses about 30,000 pounds annually, besides a certain amount of coal. Well-to-do English families, being not quite so rigid in their domestic economy as the Germans, require,

each, 40,000 to 60,000 pounds a year.

Petroleum is very cheap, and some families use a kerosene stove for nearly all their cooking during the warm months. Every family uses more or less charcoal. Charcoal burners make havoc with all wood growths that, if let alone, might struggle up into forests.

### WATER SUPPLY.

The question of a water supply will soon have to be faced by the government of Jerusalem, or else it will be next to impossible to live here in the dry season. The new roads and the constantly increasing number of carriages are evidences of progress in the right direction; but, as always in civilized life, one want creates another. Twenty-five years ago the cisterns then existing held sufficient water for the needs of the inhabitants, but now an increasing population and increased travel and traffic demand a water supply beyond any ordinary cistern

capacity.

The rock formation of the country is limestone, some of it very soft, and when even the harder varieties are broken up and placed on the roads as covering for the earth, the wheels of carriages soon grind it into white powder. Clouds of this dust envelop the houses outside the walls, blind the people in the streets, enter the stores and shops beyond any possible power of their owners to prevent it, fill the eyes, ears, and nostrils of men and beasts, increase by 50 per cent ophthalmic diseases, and cover the trees, whose leaves should be green, with so thick a coating that they appear to have been painted white. The dust in Jerusalem is already an intolerable nuisance, and, owing to conditions mentioned, is getting worse year by year. The prospect for an immediate change for the better is not encouraging, owing partly to the absence of any source whence an ample water supply could be obtained and partly to obstacles arising from the government itself.

### SPECIAL REPORTS.

The industries of Jerusalem deserve a special report, and I am confident that if properly prepared some features of it would prove to be of peculiar interest.

Vine culture and the production of wine also deserves to be treated in a separate report. At present the industry seems to be growing

faster than markets are opened for the sale of the wine.

Another special report must be on Jewish colonies in Palestine. Since I made a very extensive report on this subject, October 3, 1891, some new phases have appeared which essentially affect the general question; but nothing has transpired to controvert the conclusion then stated, namely, that Jewish colonies in this country are yet only in the experimental stage.

SELAH MERRILL, Consul.

JERUSALEM, September 26, 1898.

# AUSTRALASIA.

# NEW SOUTH WALES.

## SYDNEY.

The trade between the United States and New South Wales is in a most satisfactory condition. Australasia is becoming an excellent market for American products, especially for various kinds of manufactured goods. In fact, I think I would be justified in stating that in no country, in which American business has been well established for a considerable number of years, has there been a more encouraging increase than in New South Wales, during the last four years.

Sydney, I think, still maintains her position as the tenth seaport on the globe in the value of her tonnage, and, eliminating in all cases goods that are imported and reexported, the people of New South Wales are, I think, the most extensive buyers and sellers in the world. As New South Wales is chiefly a pastoral country, her prosperity

must depend largely on the seasons, and as her seasons are very uncertain, it must be noted that to secure uniform prosperity, the intelligence

and energy of the people must be of a high order.

As there are no statistics published later than the close of the calendar year 1897, in most matters I am unable to cover a later date, though as to the progress of our trade in the port of Sydney, owing to the generous action of Mr. N. Lockyer, the collector of customs, in putting extra force on his books, I am enabled to bring our imports down to the close of the present fiscal year, June 30, 1898.

## LIVE STOCK.

The year 1897 in New South Wales was one of extreme drought,

and in many parts of the country, severe losses were suffered.

Sheep.—The number on December 31, 1897, was 43,952,897, a decrease for the year of 4,365,893. The actual loss in number of over 4,300,000 in a country of 1,250,000 people relying very largely on the exportation of wool and mutton, would seem to almost any other country a discouraging catastrophe. The seasons for the last five years have been so unfavorable as to cause an almost uniform decrease in this profitable staple.

The following records the number of sheep for each year from 1891 to 1897, inclusive: 1891, 61,831,416; 1892, 58,080,114; 1893, 56,980,688; 1894, 53,977,270; 1895, 47,617,687; 1896, 48,318,790; 1897, 43,952,897.

In 1897, there were 1,171,794 sheep imported and 1,022,295 exported. Of Merinos there are:

Combing wool	39, 011, 805 11, 054, 131
Total	40, 065, 936

The better sheep in the country are mixed with our Vermont Merinos, the interest in such crosses being on the increase. It is said that in 45 districts the flocks are improving in quality, in 17 they are "stationary," and in 8 they are deteriorating.

The total clip for the year, in grease, was 224,281,646 pounds; a decrease for the year of 30,594,536 pounds. The total value of wool, in

the last two fiscal years, was:

1897: £8,262,605, or	
1898: £7,413,907, or	

This constitutes fully one-half of the purchasing power of the people. During 1897, there were 78 stud sheep imported into this colony from the United States, valued at £2,100 (\$10,306). During the first half of 1898, Mr. E. M. Bissell, of Vermont, sold 24 rams, directly imported, for an aggregate of \$3,949.90, or an average per head of \$164.58. (Stock and Station Journal.)

One hundred and seventy-seven more fine-bred Merino sheep from Vermont were shipped by the steamer *Queen Christina*, which sailed from New York May 21 last, and are due in Sydney by Monday next, August 1. Cables say the "animals stood the long voyage extremely

well."

I attended the annual sheep show in Sydney, and found the woolgrowers to be an enterprising and very intelligent class of men, expressing a determination to yield to no discouragement.

Horses.—December 31, 1897, 466,813; a decrease for the year of 17,215. Cattle.—December 31, 1897, 1,966,729; a decrease for the year of 76,998. The tick plague is coming this way from Queensland.

## MINING.

The following will show the mining production of the colony:

Gold:	Ounces.	Coal:	Tons.
1896	296,071	1896	3, 909, 516
		1897	
Silver:	•	Silver and lead ores:1	•
1896	202, 789	1896	286, 939
1897	150, 005		

Number of men employed in the production of coal in 1896 was 9,460; in 1897, 9,978.

Besides these, there were other mining products, such as copper, iron, antimony, bismuth, chrome, platinum, etc., yielding a considerable amount, the total value being—

1896	£4, 478, 368, or	<b>\$21,764,669</b>
1897	4, 685, 273, or	22, 770, 427
The value of gold was:		
1896 1897	1, 073, 360, or	5, 216, 530
1897	1, 088, 413, or	5, <b>289, 688</b>
The following statistics also relate to gold:		

The following statistics also relate to gold:

		Ounces.
E	xported, uncoined	118 555
=		220,000
ĸ	eceived at mint of colony	203, 414
	· · · · · · · · · · · · · · · · · · ·	•

In these metalliferous mines there are employed in gold alluvial, 9,030 men; quartz, 12,256; silver, 6,204; copper, 1,710; tin, 1,297; all others, 732, or a total of 31,229 men.

<sup>1</sup> Most of this is exported in shape of silver lead.

### AGRICULTURE.

The statistics are not yet out, but it is claimed on good authority that the number of agricultural holdings was increased fully 20 per cent during the last year.

The total acreage under crops of all kinds for 1897 was 1,659,717; in wheat, 866,112 acres. For 1898, total, 1,821,829; in wheat, 923,350 acres. The production of wheat in 1897 was 8,853,445 bushels; in 1898,

10,560,111 bushels.

The crop for the latter year for the first time, it is said, placed New

South Wales among the wheat exporting countries of the world.

The dairy industry is increasing rapidly. The export of butter for 1897 was 6,655,761 pounds, while for 1896, it was but 2,770,088 pounds. There is a growing market for dairying machinery, and our people should have more of it.

There is very little headway made in the exportation of fruit.

### MANUFACTURING.

There has been very little progress, or at least increase, in manufacturing enterprise during the last year in the colony. The statistics are not yet available, but I am informed that the number of hands employed in manufacturing industries is not much greater than a year ago, when returns showed 49,055 persons.

### SHIPPING.

The total tonnage for the port of Sydney was, for 1896, 3,911,050 tons, and for 1897, 4,257,299 tons, while the total for all ports of the colony

was for 1896, 6,189,760 tons, and for 1897, 6,744,431 tons.

There were, for 1896, 6,432 entries and departures of vessels in the ports of New South Wales, with crews aggregating 192,608, while for 1897, there were 6,465 entries and departures, with crews aggregating 206,906 men. No new shipping lines have been opened to New South Wales during the year, save that in May last, it was arranged that two steamers should leave New York for Australian ports each month, via Cape of Good Hope.

### . COMMERCE.

The total trade of New South Wales for the fiscal year ending June

30, 1898, was about £46,500,000 (\$225,000,000). The total trade of New South Wales with foreign (not British) countries during the calendar year 1896 was £8,925,683 or \$43,378,820, of which £3,794,833 (\$18,442,889) was with the United States; for 1897 the total trade with the same countries was £9,973,557 (\$48,471,488), of which £4,350,196 or \$21,141,953 was with the United States.

Manufactures were imported during the fiscal year 1898 as follows:

United States£1	. 437. 547 or	\$6, 995, 822
Germany	837, 144 or	4,068,520
France	20, 144 or	97, 900

Among new lines introduced by our people in this market may be recorded bicarbonate of soda, caustic soda, soda ash, sulphate of copper, steel sheets, plates and channels, and pease and beans.

Imports into New South Wales from the United States from July 1, 1897, to June 30, 1898.

## INTERNAL IMPROVEMENTS.

The wharfage facilities have been considerably improved during the

last year.

There were 52 miles of new railway constructed in the colony since June 30, 1897, making a present total of 2,691 miles, while there has been £100,000, or \$486,000, spent in straightening lines, reducing grades, etc., making a total cost of £37,750,000 (\$183,465,000); and £63,000 (\$306,590) was spent in improving or keeping up the rolling stock, the total expenditure for which has been £4,500,000, or \$21,870,000.

Several miles of street railway tramway are being built in Sydney, most of the material and appliances for the construction of which were

purchased in the United States.

While business and industry have not recovered from the effects of the financial shocks of 1893, the evils of the "unemployed problem" are decreasing, and the indications, as well as the feeling among the people, are more hopeful.

GEO. W. BELL, Consul.

SYDNEY, July 11, 1898.

### COTTON GOODS IN NEW SOUTH WALES.

I have taken great trouble to learn something of interest to our textile manufacturers, as it has seemed plain to me that with our superior machinery and more active and intelligent labor, we should be able to secure a considerable trade in this market.

Not being an expert in the trade, however, I was obliged to rely on men whose experience justified my confidence, and I herewith forward a communication from such a person, sent me in answer to interrogatories on the question. I believe it approximates the real condition of the branch of the trade under consideration. After conversing with many experienced men, I am more than ever convinced that it would pay our manufacturers to send an expert to Australia.

GEO. W. BELL, Consul.

SYDNEY, October 24, 1898.

With their great natural advantages in producing raw material, combined with their general up-to-dateness in other matters, it appears that the manufacturers of the United States should have no difficulty in controlling a very considerable proportion of the textile trade of Australasia. This, however, except in a few articles of limited consumption, is not the case. They are still simply touching the fringe of the cotton piece trade of these colonies. Many lines in which they ought to do large business they sell only occasionally and in small quantities, while other articles are not dealt in at all. The reason for this mainly rests with the manufacturer himself. In most instances, the value is satisfactory, but the finish or width is not suited to the requirements of the market, and, from what I can gather, the manufacturer turers have repeatedly refused to adopt suggestions to improve the two latter features. This is fatal to the trade, and simply makes any effort on their behalf a waste of time. It conveys the impression that many of the American manufacturers are not seriously desirous of doing business in Australasia, unless the Australasian public is prepared to buy their wares as produced for their local market.

public is prepared to buy their wares as produced for their local market.

They are quite prepared to ship their surplus production to Australia (if they can find an agent clever enough to sell it), but they seem indisposed to manufacture to suit the requirements of the market. Until they adopt a more progressive policy in this respect, they need entertain but small hope of ever doing much business here. The Australian trader flatters himself upon knowing what is necessary for his business, and, being keenly alive to the main chance, is ever ready to take any "new cloths" that will give him advantage in value, and possess the necessary requirements in width, weight, and finish.

ments in width, weight, and finish.

These latter features are of the greatest importance, and, as previously stated, it is where the American manufacturers fail. Improvement in this direction would

mean a great augmentation of their trade with these colonies.

I have inspected a collection of American cotton goods, and beg to convey my impressions of a few of the principal classes. There are many lines that are totally unsuited to our trade, or of which the sale is very limited. These need not be referred to.

The climatic conditions of Australia make possible the wearing of cotton fabrics for at least three-fourths of the year. In Queensland, "prints" are worn all the year round. This means that the cotton piece trade for dress purposes alone is of great volume and well worth the sincerest effort of any manufacturer to secure. It is divisible under three main heads, viz, plain, printed, and woven.

Under the first head would come what are known to the trade here (the Englah term) as whites: also gray (unblesched) enlices which include calicoes and about

term) as whites; also gray (unbleached) calicoes, which include calicoes and sheet-

ings of all kinds. In point of value, I can not find much fault in these; if anything, they are too good. They are purer than the English goods. The latter are usually filled with clay, especially in the lower qualities, which enables a better finish to be given them. For this reason, a comparison of an English cloth at the same price would seem to be in favor of the latter; but it would not so well stand the process of washing. It is noteworthy, however, that the English manufacturers are now making purer cloths than formerly, and there is a distinct feeling in their favor among the traders and the public. I recommend, therefore, that American manufacturers are the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet of the feet among the traders and the public. I recommend, therefore, that American manufacturers refrain from "filling," but endeavor to put a little more material into their lower qualities of white and gray calicoes, and thus remove the open or poor look they now possess through absence of filling. This should, of course, be done, if possible, without increasing the price. Cloths of this kind, once taken up by buyers, would never be dropped, as they could not fail to give satisfaction to the public, who are the great arbitrators in all these matters.

who are the great arbitrators in all these matters.

Plain and twill gray sheetings.—Apart from the absence of weight, the United States goods are not the right width. If made in 54, 60, 66, 72, 84, and 90 inches, with proper attention to weight and finish, a good trade should be established. Considerable quantities are used for tent making, although for the latter the Government is now taking up a light make of duck, which the American makers should be able to produce satisfactorily. The samples I saw of these ducks included nothing suitable.

They were all too heavy, being intended for sail cloths, etc. The same make, but lighter in texture, would do.

In bleached sheetings, the same remarks regarding widths and finish apply.

In white calicoes, only three widths are necessary, viz, 28.9, 32.33, and 35.36 inches. These are mostly used for foundations for cotton dresses and for the manufacture of ladies' and children's under garments. The English manufacturers have now attained a very high stage of perfection in these. Their yarns are very fine and clean, and the soft, dry finish now given them is a big improvement on the old "wetwove" finish of years ago, which for this market is now a thing of the past. In these goods the English makers are discarding the "filling" process. The public wants

Printed calicoes 2.—For reasons previously stated, this is a very important line, but not much effort seems to have been made to secure it. In the first place the width is wrong. Those I saw were mostly 24 inches; this simply bars them from this market, apart altogether from the question of value, which seemed to me to be fairly good. They should not be narrower than 29.30 inches. The cloths might be made of finer yarns, especially the low qualities, which are very coarse and heavy. The colors and designs are also of the greatest importance, and in both respects, those I saw are a long way behind the British and Continental goods. In these, there is a distinct fashion each season, and for this trade the patterns must be produced twelve months in advance. The English printers watch the trend of fashion very closely, and usually copy on their cheap cloths what has been fashionable in Paris and London the previous season in expensive goods. The Australasian colonies follow the London fashion, and to do a trade in printed fabrics necessitates being right up to date in design and color. In the latter respect, the American printers are not so advanced as the English. Their goods do not possess that soft, artistic, refined look that characterizes the English prints and commends them to the female taste. As against this, I mention a range of printed muslins that are the best I have seen among American productions, and with proper handling, and if produced in fashionable designs and colors, should without much difficulty be placed in this market. The cloths referred to are Roman delaine, Bijou organdie, El Coronado tambourette, Lappette, Batiste, and several other similar cloths, all evidently from the same mill. These seem very good value, so far as quality of cloth is concerned, and the

designs and colorings are just what are being worn here at the present time.

Denims.—This is an article in which the American manufacturer has completely ousted the English makers from the market. This illustrates the advantage of producing something to suit the buyer. The English makers refused for years to listen to the suggestions of altering the finish of their denims to suit the improved taste of the public. Now, when they would do so, they find it too late. This should be a lesson to United States manufacturers. The Canadians are now securing a considerable share of this trade, which, until a few years ago, was entirely in United States hands. The reasons, so far as I can learn, are that while there is practically nothing to choose between the two in point of value, the finish and appearance of the Canadian article are preferred. Buyers say the rib or twill is better defined, and that the colors are clearer. This latter feature, they claim, is due to the purer water by

which they are finished.

I saw two ranges of what are called "homespun" and "heavy homespun" (No. HH 1000). These are heavy, open, rough, unbleached cloths, and seem to be an imitation of Assam silk, which is much used in Queensland for men's garments, being cool and light. These should, if put on the market, be easily introduced there.

Silesias.—I could not get prices on these, and consequently, I can not speak of the value, but the finish seemed right. They should be made in 36 and 40 inch in black, brown, fawn, white, and dark and medium slate. The two latter shades are the principal colors. There is a large trade in these, as they are used for dressmaking purposes. Another line used for the same purpose, and which has a very large sale, is percaline, or, as the English makers more appropriately term it, "linenette," as it is

finished in imitation of the linens at one time so much in vogue.

Tickings.—The blue and white tickings shown me I did not think much of, either in value or finish. They are, however, hardly worth troubling about, as the trade in them has greatly fallen off in recent years. Fancy tickings are what is wanted, and the Belgians seem to do them better than any other nation. Seventh-eighths of all that come to this colony are made in Belgium. Judging from what I saw among samples, Americans ought to have no difficulty in securing this trade. The value of those I inspected is good, as there is plenty of substance in the goods, but they lack finish; they are too dry. They should have a glossy satin finish. The widths, again, are all wrong, and I understand suggestions to alter them have been ignored. The best width for this market is 63 inches. This suits the bedding manufacturing trade by which it is meetly used trade, by which it is mostly used.

Towels.—Those I saw were not what is required here. Plain brown, brown striped, plain white, and striped white Turkish towels are the only kind in demand.

entirely useless to try to place anything else.

There are a great many other articles stocked by warehouses here that no doubt your manufacturers make, but it would serve no useful purpose to refer to them. I have mentioned the leading lines in which the bulk of the trade is done. Secure these first, and the less important lines could be introduced subsequently.

There is no reason whatever why American manufacturers should not secure a very fair share of the textile trade of Australia, but to do so, they must first of all convince the buyers of the value they can offer, and having succeeded in that, they must produce cloths that are suitable to the market in width, weight, color, design, and Unless these features are heeded, no consideration of value will be entertained.

The question of terms and conditions of trading is one that may also have an important bearing on the trade of the colony with America in soft goods. All the leading distributers in all the colonies have their established agencies in London, which do not look favorably upon business that goes past them. Some distinct advantage has to be gained to justify the heads of houses at this end in departing from the usual channels of supply. Long credit, with frequent renewals of bills, has to be given by all the merchants here, and, being so far from the source of production, credit has also to be taken. To direct, therefore, any considerable portion of their purchases into a groove where prompt cash is demanded requires sometimes serious consideration, even from houses whose financial position is undoubted. This will always be a hindrance to securing a large share of the trade, and to overcome it, some special inducement in these directions will be necessary. Perhaps, the lengthening of the term of credit would assist. Canadian manufacturers are inclined to liberality in this direction.

The total value of all imports from the United States for the year ending June 30, 1898, was \$78,345.78. The total value of all imports from the United States for the year ending June 30, 1897, was \$120,061.42. This falling off of trade is due almost entirely to the fact that no flour was imported from the United States during the year ending June 30,

1898, and likewise a less amount of kerosene oil.

I glean from personal interwiews with the various dry goods merchants that the only goods imported from the United States are white and gray calicoes, printed cottons, and cotton piece goods generally. Overalls stuff (dingaree) is sold quite largely, and gives perfect satisfaction. Our cheap calicoes and prints are not known here; similiar English goods supply the demand at much higher prices than are charged in America. There is a fine opening here for the development of business in the cheap cotton goods, but English woolen fabrics are furnished much cheaper than those manufactured in the United States.

American goods must be properly and systematically introduced to the attention of the business men here. I would suggest that one of the export associations send a representative, with a good line of samples, so that buyers can examine what is desired to be introduced. Such a man would have no trouble in building up a large trade in cotton goods, hardware, wooden ware, farm machinery, and cheap, well-made bicycles. In some instances, samples sent by mail might answer, but on the whole, it requires personal contact to insure permanent business growth.

The business men, in conversing on the subject, advise that American manufacturers send a representative to London, to there examine the kind of goods sent to Australia, for most of the goods come via that city. British manufacturers also understand better the wants of the Australians. I would advise, as stated above, sending a repre-

sentative to Australia.

Large quantities of tobacco grown in America come here from London. Many American drugs reach here through the same route, most of which are landed in Sidney. Hence the tables, while showing what was landed at this port, do not at all show the quantity of American goods used here.

I learn that choppers of German make are preferred to the American goods, because they are finished in better taste and are a trifle cheaper

in price, while equal in quality.

American flour is not considered of as good a quality as that made from Australian wheat, and sells for 6 pence (12 cents) less on 50 pounds.

It is claimed that the bread made from American flour is much

darker in color than that made from Australian.

The rates of exchange are as follows:

		cent.
On demand		. 11
Thirty days		. ii
Sixty days.		
Ninety days		` }
Almory days	••••	,

No changes have been made in the harbor and other dues collected

at this port.

People in this vicinity take a deep interest in sports, especially hunting. A gun club has been organized, composed of energetic business men. If the various manufacturers of arms of America would establish agencies here, a fine business in sportsmen's goods could be built up. All grades of soaps are made here. American soaps are liked, and

the manufacturers here stamp one grade "United States Soap Com-

pany" in order to satisfy the demand for American soap.

I have called upon a large number of the business men of Newcastle, most of whom know nothing of American manufactured goods other than those I have mentioned. With a live representative on the spot, I feel no hesitation in stating that our trade with Newcastle may be made many times greater within a few years.

I have endeavored to give as complete an account of commercial con-

ditions in this port as is possible, with the data at hand.

In connection with this report I will state that, owing to the interest I have taken in the commercial affairs of this city, I was notified to-day that I have been elected an honorary member of the Newcastle Chamber of Commerce.

F. W. GODING, Consul.

NEWCASTLE, November 1, 1898.

# NEW ZEALAND.

## POPULATION.

The estimated population of this colony on the 31st of December, 1896, was 714,162, of which 376,987 were males and 337,175 were females.

## Increase during the year 1897.

	Males.	Females.	Total.
By births	9, 600 12, 153	9, 137 6, 439	18, 737 18, 592
Total	21, 753	15, 576	37, 329
Total net increase	7, 716	7, 178	14, 894

### Decrease during the year 1897.

	Males.	Females.	Total.
By deaths	3, 787 10, 250	2, 808 5, 590	6, 595 15, 840
Total	14, 037	8, 398	22, 435

The total estimated population on the 31st of December, 1897, was 768,910, of which 384,703 were white males and 21,673 Maori males, and 344,353 white females and 18,181 Maori females.

# MONEY MARKET.

There is no noticeable change in this market. The fluctuations in London rates are often caused by circumstances that are local and temporary in character, and frequently without any effect here, and this is the case with the recent rise in the discount rate of the Bank of England. The supply of money is amply adequate for all local demands, and the value in the open market is without alteration. Advances on good, sound mortgage security are readily obtainable at 5 to 5½ per cent,

while anything specially good can command money at 4½ per cent. Shares in good, sound undertakings and the best classes of freehold property are in steady demand for investment purposes. Bank rates are as quoted below:

### GOVERNMENT LOAN.

The Government is asking Parliament for power to raise \$2,500,000 in aid of public works and land settlement, the money to be apportioned as follows: Continuation of railroads under construction, \$875,000; additional rolling stock, and other works and purposes in respect to open railways, \$1,000,000; construction of roads, tracks, bridges, etc., \$625.000.

In this connection, it may be remarked that there is every reason to believe that several new railway lines will be opened during the ensuing year, by which the entire colony, and Auckland in particular, will be benefited. It is also thought that the time taken by mail steamers between this colony and San Francisco will be considerably lessened, thereby affording an even more satisfactory mail service than now exists. The present time between Auckland and San Francisco is nineteen days, while that of the Vancouver line is twenty-two days from Vancouver to Wellington. It is hoped that an arrangement can be perfected to reduce the running time between San Francisco and Auckland to fifteen or sixteen days. Aucklanders are more favorably inclined to this line than to the Vancouver one. They appreciate its long and faithful service (covering a period of many years), its steamers arriving and departing with a regularity that has been the admiration of every fair-minded person in the colony.

### SHEEP.

# The following newspaper clipping may be of interest:

### THE WOOL CLIP.

The subjoined table furnishes a summary for the last two years, ending with June 30, of the weight of the exports of wool from the several ports of the colony, as recorded in the official returns:

	Bluff		7, 811, 211
Total colony		149, 788, 712	59, 249, 979 182, 436, 981

The weights of shipments for the last three years compare as follows:

	1897-98.	1896–97.	1895-96.
North IslandSouth Island		Pounds. 73, 187, 002 59, 249, 979	Pounds. 68, 924, 917 60, 422, 908
Total	149, 788, 712	132, 436, 981	129, 847, 825

The total for 1897-98 shows an increase on 1896-97 equal to 13 per cent, while the North Island's improvement is equal to 16 per cent, and that of the South Island to less than  $9\frac{1}{4}$  per cent.

As compared with 1895-96, the latest year shows a gross increase of about 15.8 per cent, the North Island rather over 23 per cent and the South Island rather over 7½ per cent.

The totals of sheep in the two islands, according to the stock taking of April 30 last, with respective export of wool, compare as follows:

·	Sheep.	Wool.
North Island	Number. 9, 886, 048 9, 734, 865	Pounds. 84, 975, 222 64, 813, 490

The much larger proportion of Merino strains among the flocks of the South Island accounts for the smaller quota of wool per sheep. The weight per sheep shows for the North Island about 8.6 pounds and for the South Island, 6.66 pounds.

In speaking of the Merino sheep of Australia, Mr. G. W. Binney, of Auckland, who has been for many years one of the best known and most successful sheep and wool merchants in the country, tells me that

he recently saw sold in Melbourne, Victoria, for the sum of \$15,500, a 5-year-old "Merino (crossed with Vermont Merino) sheep," which came from the "Gibson flock," of Tasmania. When 3 years old, this same sheep was sold for \$16,500.

### IMPORTS AND EXPORTS.

The total imports and exports for the past year were as follows: Imports, \$38,824,322, against \$33,523,000 for 1896; exports, \$48,148,069, against \$41,761,157 for 1896.

Imports from the United States in 1897 were \$3,056,376, against \$2,398,405.86 for 1896 and \$1,918,434.89 for 1895. The increase in imports from the United States to this port in 1897 was \$112,167.

Exports for the year ending the 30th of June, 1898, were \$3,692,422, against \$1,825,404.68 for 1897 and \$1,589,345.36 for 1896. It is gratifying to note that the imports and exports between the United States and this colony are steadily growing, the imports covering many new articles, too numerous to mention in detail. With the better freight service between Australasian ports and New York, which is now thoroughly established, I am of opinion that many of America's products now unknown here can be successfully introduced into these colonies. Boots and shoes of the better class, furniture, canned goods, and Yankee notions ought to find a ready market in this part of the world. I have personally introduced many new articles in this colony the past year, and am constantly in correspondence with American houses that are anxious to extend their sales to this far-off land.

### AUCKLAND HARBOR BOARD.

In his annual address, the retiring chairman of the Auckland Harbor board said, among other things, that the past year had been a more than ordinarily eventful one; that it had met with a larger measure of success in its operations than in previous years. I quote as follows:

The board's revenue the past year has been the largest in its history, amounting to the splendid total of £56,668 (\$275,775). It was a matter of great satisfaction that, for the first time in the history of the port, the San Francisco mail steamer was berthed on her last trip at Quay street jetty No. 2, and lay but a few feet from one of the streets of the city.

of the streets of the city.

Nature has endowed this city with a harbor possessing unequaled advantages, and but little requires to be done by us, as compared with what has to be accomplished in other places, in order to fit the port for carrying on a trade of the greatest magnitude. The geographical position of Auckland should, with a well-equipped harbor, give it a predominant position in the South Seas. The possibilities of the future are most gratifying to everyone having the interest of this city at heart. The establishment of the Vancouver line of steamers and the continuance of the San Francisco service, in each case Auckland inevitably being the port of call, are in the immediate foreground, while the opening of either the Panama or the Nicaragua canals will enormously enhance the importance and trade of the port. The trade of the Archipelagoes of the south and western Pacific is our natural inheritance. In short, it is not alone the interchange of commodities with any particular country upon which we need build our hopes, for evidences are abundant that commerce, armed with the "swift shuttles of an Empire's loom," is destined to render this port the most signal service, and to build up a mighty city on the shores of our harbor.

I am indebted to the efficient secretary of the board for valuable information, which I have been able to use in the preparation of that part of my report which treats of the trade of Auckland, which I now give. It will be observed that Auckland is an important port, and that its trade is rapidly increasing. Its harbor is one of the best in the world.

Value of imports and exports for the year 1897 for the port of Auckland.

AUCKLAND, October 11, 1898.

## STATISTICS OF NEW ZEALAND.

Through the courtesy of the registrar-general of New Zealand I am enabled to furnish the following interesting statistics for the years 1897 and 1887, which have been very carefully and accurately prepared and which will, I doubt not, be of interest to Americans in general:

	1897.	1887.	Increase, per cent.
Total imports (excluding specie) dolls	8, 621, 654	29, 511, 823	31. 82
Total exports (excluding specie) do	47, 405, 657	82, 511, 977	45. 81
Total export of woolpounds	185, 835, 117		52.92
Total export of frozen meats cwt	1, 407, 921		250, 14
Total export of tallowdo	810, 200		100.49
Total export of sheepskinsnumber	3, 688, 051		151. 29
Total export of butter	99, 022		481.75
Total export of cheesedo	77, 683		224. 86
Mining:		1	
Output of coaltons	840, 718	558, 620	50.50
Output of goldounces	251, 645	187, 988	33, 90
Occupied lands:	•		l
Holdingsnumber	(year 1896) a 58, 904	(census, 1886) a 86, 485	a 61, 45
Holdings, extent of (including			1
Crown pastoral leases)acres	(year 1896) 83, 312, 212	(census, 1886) 27, 848, 690	19. 62
Land in cultivation (including			l
sown grasses)acres	(year 1898) 11, 488, 127	(year 1888) 7, 309, 689	57.09
Live stock:			1
Sheepnumber	(Apr., 1897) 19, 687, 954	(census, 1886) 16, 564, 595	18.86
Cattledo	(Nov., 1897) 1, 209, 165	(census, 1886) 858, 858	41.69
Horsesdo	(Nov., 1897) 252, 834	(census, 1886) 187, 882	34. 93
Shipping:		' ' ' ' ' '	
Inwardtonnage	686, 899	489, 754	40.25
Outwarddo	€75, <b>8</b> 38	493, 583	36.82
Government railways:			
Miles opennumber	(Mar., 1898) b 2, 055	(Mar., 1888) 1, 758	17. 23
Receiptsdollars	(Mar., 1898) 6, 696, 843	(Mar., 1888) 4, 841, 408	88. 31
Electric telegraph:			1
Miles of linenumber	(Mar., 1898) 6, 484	(Dec., 1888) 4, 790	35. 37
Messagesdo	(Mar., 1898) 2, 696, 233	(Dec., 1888) 1, 765, 860	52. 69
Post-office money orders issueddo	293, 659	159, 579	84. 02
Banks of issue, on deposit (year's aver-			
age)	69, 544, 776	53, 685, 350	29. 54
Savings banks (post-office and private),			
on deposit December 31dollars	<b>26, 868, 469</b>	11, 717, 442	129. 26

a The comparison is not quite a fair one, as in 1895, holdings of exactly 1 acre in extent and certain holdings occupied by Maoria have been included by the Department of Agriculture, which was not done in 1886. b There were also 167 miles of private railways.

FRANK DILLINGHAM, Consul.

AUCKLAND, August 29, 1898.

## COTTON GOODS IN NEW ZEALAND.1

"American goods, speaking generally, do not conform to our conditions," said a well-known and prominent buyer for one of Auckland's largest wholesale drapery houses in an interview yesterday. "The majority of drillings, ducks, and denims are suitable to our market, but the calicos, sheetings, and printed cottons are too pure. The designs and patterns of United States goods are too old fashioned. The British patterns are invariably copied, but by the time they are produced in the United States, they are out of date in the colonies."

When asked for information as to the coarser classes of cotton textiles manufactured and consumed in the colony, I was told that information as to the number of picks and number of yards to the pound can not be obtained, as the qualities imported are too numerous. One firm in Auckland alone imports scores of different classes, but to get the par-

ticulars would be impossible.

I am asked in the Department's instruction if there is any disposition in this part of the world to take up American goods other than the ordinary standard sheetings and drills. This is purely a matter of price and adaptability. American houses have sent men to the colony with samples, etc., and although prices have been low, these agents have done but little trade, owing to their goods not being suitable and not comparing favorably with British manufactures. I understand that some agents have recognized, upon going through the colony, that their classes of goods were not satisfactory. I recently saw samples of a large stock of American sheetings sold by a commercial traveler to one of Auckland's merchants. The price was said to be very low, but the quality was too pure, and the trade took British manufactures at higher prices in preference.

The American style of packing goods for export to this colony is

said to be satisfactory.

The present rates of freight from New York, via the new freight

steamers, are considerably less than from London.

British firms give much longer credit than the Americans. British manufacturers ship to local firms of good rating, and draw at six months, or even longer, from the first day of the month after the shipment of goods, or six mouths after the date of the arrival of the goods in the colony. The American terms are always less favorable and often very severe.

### PASSPORTS, LICENSES, MARKS.

Passports are not required in New Zealand, nor are licenses to sell. It is necessary for goods made outside of England to be marked.

### TRADE METHODS.

American firms attempt to sell their goods in this colony simply from catalogues and price lists. This is a great mistake, and the sooner it is changed the better. Again, some of our American dealers, after putting their consuls to a great deal of trouble in interviewing the trade in search of some suitable firm to handle their goods, will, when once a party has been induced to order a shipment, immediately draw upon them for payment, although the chances are two to one that at least

five or six months will intervene before the goods will be received. This is a bad practice, and naturally causes prejudice against American manufactures and manufacturers.

FRANK DILLINGHAM, Consul.

AUCKLAND, November 22, 1898.

# QUEENSLAND.

In reply to the Department circular of August 5 I send herewith a report on the commerce and industries of Queensland.

## Imports and exports of Queensland for the year 1897.

Large quantities of Queensland produce are sent to Sydney in New South Wales, and are exported thence to other Australian colonies and foreign countries, and appear as exports from those colonies. There being comparatively few vessels from Queensland to foreign ports, and the principal steamship lines having their termini at Sydney, the products of Queensland go in a large measure to swell the foreign exports of the southern colonies of Australia. This is notably the case with wool.

The imports and exports for the year 1897, and the value thereof, were as follows:

### IMPORTS.

Article.		Value.		
otton, woolen, silk, and linen piece goods	£496, 934	\$2, 418, 32

Artesian bores—three hundred and f	orty	-four.	

In consequence of there being no bureau of statistics in this colony and so many articles being enumerated under a general heading, it is impossible for me to compile this report with the accuracy that I desire. For this reason, also, I am unable to get details of commerce to June 30, 1898, as the reports for this Government are made up to December 31 each year. I have endeavored to ascertain particulars up to the 30th of June, 1898, but have been unable to obtain it, either from official or unofficial sources.

#### WAGES.

At the moment of writing, building trades are very brisk, and labor of this kind is very scarce; domestic help is also in great demand, and almost unobtainable. The wages given in the table below are now paid in the various trades:

Description of labor.	Average wages without board and lodging.	Average wages with board and lodging.

#### TARIFF.

Though the duty on most articles in this colony is 25 per cent ad valorem, yet there are large numbers of United States products which are admitted free, as the tariff does not discriminate in any way between

goods manufactured in Great Britain or elsewhere.

Some of the more important articles on the free list are agricultural machines and machinery of all kinds; bicycle and tricycle parts and accessories, rough and unfinished; minor articles required in the making up of apparel—boots, shoes, saddlery, vehicles, etc.; dental and surgical appliances; most drugs and chemicals; dyes; explosives; jewelers' tools; joiners' machinery; diamond rock accessories; carding and spinning machinery; looms; cotton-seed oil; saddlers' ironmongery; iron wire—plain, barbed, and galvanized.

The port regulations apply equally to vessels of all nationalities, and wharfage dues on goods imported are payable by the importers. The complete list of harbor dues on goods imported into this colony, as well as the marine regulations, pilotage rates, and exemption and dock dues, will be found in detail in Statistics of Queensland, 1897, sent

herewith.

At the time of writing, the eminent American engineer, Mr. Lindon Bates, is advising this Government with a view to improving harbor facilities, and when a course is finally adopted I will make a further

report on this question.

The city of Brisbane is situated on the Brisbane River, 9 miles from the mouth, which, in turn, is 40 miles from Cape Moreton, the entrance to Moreton Bay. It is necessary for sailing vessels to employ a steam tug up and down the river, which at the present time carries a depth of 20 feet, but before long this depth will be considerably augmented.

#### TRANSPORTATION.

The internal transportation facilities are by means of railways, owned and operated by the Queensland Government. The total length open for traffic is 2,635 miles. Lines start from each of the principal coast ports of Queensland, viz, Brisbane, Maryborough, Bundaberg, Rockhampton, and Townsville, and run into the interior. Communication with the distant cattle ranches and sheep stations is by means of bullock drays. There are no rivers suitable for transportation more than 50 miles from the mouth.

There is regular steamer service, both passenger and cargo. Rates

of freight are kept moderate by competition.

The ocean transportation from the United States is by a line of steamers from New York via the southern ports of Australia, and also by sailing vessels. Several lines of steamers ply from Great Britain via other Australian ports, and one line of mail steamers, viz, the British India Steamship Company, plies direct between Queensland ports and Great Britain via Torres Straits and Batavia.

Queensland is being brought into closer communication with the United States, by a line of steamers between New York and Brisbane. The time occupied by sailing vessels was about 120 days, whereas now the time is less than half, with a very small increase in the rate of

freight.

There are 95 steam vessels of a tonnage of 13,810 and 143 sailing

<sup>&</sup>lt;sup>1</sup> Filed for reference in Bureau of Foreign Commerce, Department of State.

vessels with a tonnage of 9,994 registered in Queensland. The steam vessels are employed in the coasting trade and the sailing vessels in the trade with the South Sea Islands, bringing colored labor to Queensland to work the sugar plantations. There are no vessels owned in Queensland employed in trade with other countries.

#### COAL.

The coal mines of this region are excellent and the product is reputed to be the best in Australia for steam coal, but for gas-making purposes, it is not equal to the coal raised in Newcastle, New South Wales. The total quantity raised in 1897 was 358,407 tons; value, £139,889 (\$679,000).

#### LICENSES.

There are no licenses required in Queensland for carrying on business, except for hawkers, publicans, etc. Commercial travelers need no licenses, nor are passports required.

There are no laws or regulations of a discriminating character, and

no taxes or excises in addition to tariff rates.

There is no law requiring goods to be marked so as to show the country of origin, unless the goods come to this colony through Great Britain, when they come under the requirements of the British trade-marks act.

#### POSTAL RATES.

The existing postal rates are as follows: Domestic letters, 2 cents per one-half ounce for delivery within any town or city boundaries, and 4 cents per one-half ounce for delivery in any town in Queensland or Australasia, New Zealand, or Tasmania. Newspapers printed or published in Queensland, to any place in Australasia, not exceeding 2 ounces, 1 cent, and for newspapers not printed in Queensland, 2 cents for every 2 ounces.

The postage on foreign letters, that is, outside of the Australian colonies, is 5 cents per one-half ounce, and on newspapers, 4 cents for

every 2 ounces.

Detailed information in regard to postal rates, electric-telegraph rates, and patent fees will be found on pages 247-249 of volume Statistics of Queensland, 1897, sent herewith.<sup>1</sup>

#### GENERAL.

The revenue returns that have so far been completed, but which are not yet available, warrant the statement that a large increase may be expected in all the principal lines of export during the current year.

The lines of manufacture in operation in Queensland are common to all countries, and show no improvements in machinery or other means of workmanship. Improved machines in use are mostly American.

Wheat growing is being rapidly advanced in this colony; there are at present 59,875 acres under cultivation, and the average yield for the present year is expected to be 15 bushels to the acre. The bushel contains 60 pounds of wheat.

<sup>&</sup>lt;sup>1</sup> See footnote, p. 1218.

The following table shows the acreage under cultivation, from 1892 to 1897, in the crops mentioned below:

Crop.	1892.	1893.	1894.	1895.	1896.	1897.
Sugar	Acres. 55, 520 318	Acres. 59, 251 475	Acres. 71,818 915	A ores. 77, 247 1, 061 60	Acres. 83, 093 994 138	Acres. 98, 641 755 34
CottonWheat	717 31, 7 <b>42</b>	191 28, 993	100 28, 997	494 27, 090	280 35, 881	48 5 <b>9</b> , 875

The machinery at present in use in the sugar mills is almost entirely obtained from Great Britain.

In forwarding this necessarily brief report on the commerce and industries of Queensland, I send herewith a copy of the book, Queensland Past and Present: an epitome of its resources and development, by Thornhill Weedon, published by authority of the Government, and containing a map. This is the most comprehensive work of its kind extant on Queensland, and forms a valuable reference book.

W. J. WEATHERILL, Consular Agent.

BRISBANE, December 9, 1898.

### TASMANIA.3

The official statistics for the colony for 1897 are not yet completed, but by the courtesy of the statistician, I am furnished with advance sheets and also with the figures for the present year to the 30th of June.

### Imports for 1897.

United Kingdom (direct)	81, 934, 481
Anetralegian colonies	A 594 GOR
Common	69 799
domany	. 00, 100
America	. 93,004
Sweden	. <b>28, 29</b> 8
Germany America Sweden Various	. <b>3,06</b> 8
Total	C CEO OOC

The imports from the Australasian colonies mainly consist of British, American, and foreign goods, which are transshipped there or purchased from colonial importers. American goods are principally obtained through the latter source, though there are transshipments of direct orders by local importers. Tobacco and kerosene alone were imported to the value of \$236,040, and, as these items would be almost exclusively American, the uselessness of statistics of imports, as given above, in showing country of origin, is clear.

#### Principal exports for 1897.

Fruit (preserved and green)	\$949, 322
Potatoes	624, 610
Hops Hides, skins, etc	89, 755
Hides, skins, etc.	208, 630

Minerals and metals (gold, galena, copper, tin, etc.)	4, 484, 800
(The 4-4-3	

The total produce of the island was \$8,379,913.

Digitized by Google

<sup>&</sup>lt;sup>1</sup> See footnote, p. 1218.

#### Imports and exports for six months of 1898.

For the six months ending June 30, the totals were:

Imports \$3,629,017 Exports 4,217,192

The foregoing figures show that this colony, like the rest of the group, is emerging from the depression which has affected them all since 1892. This result has been considerably aided by the expansion of mining. The population, too, from 1894 to 1897, has increased from 155,940 to 168,916. The mineral exports have increased in the last decade from \$2,691,780 to \$4,484,800.

The developments in mining may be expected to continue for many years. The mineral area is very extensive, but the country is mountainous, densely wooded in parts, has a heavy rainfall, and is most

difficult of access generally.

American manufactures, especially agricultural machinery and implements, tools, cycles, boots, and shoes, are becoming better known.

Trade has been mainly of a retail character. Importers supply themselves principally through the representatives of American manufacturers in Sydney and Melbourne, in small quantities to meet their requirements. There being little inducement for vessels to load for Tasmanian ports, those importers who order direct from the United States procure the goods, as already indicated, via an Australian port. Increase of business will depend upon the relative prices and quality of goods. If these be in favor of the American article, any conservatism that exists can be easily overcome. The question of credits is, I believe, hardly a factor in the case. The practice of giving these was mainly confined to soft goods, and is now much less general.

A. G. WEBSTER, Consul.

HOBART, October 29, 1898.

### VICTORIA.1

Both the imports and exports of the colony of Victoria during the past year show a substantial increase over those of 1896. The total imports during 1897 amount in value to \$75,209,236, and the exports to \$81,463,604, the figures for 1896 being \$70,831,114 and \$69,097,087, respectively.

The principal articles imported and exported during the year are shown in the following list, compiled from the Statistical Register of Victoria for 1897. The values therein given are those declared by the importers, except as to goods subject to ad valorem duty, which are given at "the fair market value thereof in the principal markets of the country whence the same were exported, with 10 per centum added."

Adda 44	<b>270</b>	•	

While the exports to the United States during the year 1897 show a decrease of \$442,336, attributable to a bad wool season, the imports, on the other hand, have improved to the extent of \$346,958, with every pros-

pect of a still further gain during the present year.

The consumption of the products of the United States in Victoria was greater during 1897 than any previous year since 1890, a steady increase since that year being noticeable. This improvement in the trade of the two countries is doubtless due to the recovery of the colony from the collapse of the recent "land boom" and to the renewed activity displayed by American business houses in pushing trade here. The representatives of our manufacturers are now more numerous here and better equipped than of recent years, and splendid results are accruing to their efforts in canvassing the Australian markets. The geographical position of these colonies must always make them large purchasers of our products and manufactures, and the present volume of trade between the two countries will unquestionably grow to vast dimensions. It is pleasing to note the acceptance by the Victorian Railway commissioners of the tender of a Pennsylvania steel company, for a supply of steel rails to the value of \$500,000. Other American tenders for the supply of engines, etc., have also been successful here, against keen foreign competition.

JOHN P. BRAY, Consul-General.

MELBOURNE, October 10, 1898.

### DECLARED EXPORTS, AUSTRALASIA.

Value of exports declared for the United States at the several consular offices in Australasia during the year ended June 30, 1898.

### SAMOA.

I transmit herewith such financial statements and statistical matter as I have been able to obtain, concerning the revenues of the Samoan Government and the municipality of Apia, also statements as to imports and exports; tonnage, inward and outward; and other matters, a portion of which may furnish valuable and desired information.

It will be seen that the exports of copra, product of Samoa, amounted to 10,691,520 pounds in 1897, and that 621,600 pounds, the product of

other islands, were also exported from this port.

It will also be seen that the imports from Germany were of the value of \$83,562, from Great Britain \$13,322, from the United States \$53,415, while from Australia and New Zealand, they were \$157,695. I learn from merchants here that a large percentage of the goods from the colonies, especially Australia, are of American origin. It is stated that all goods or products originating east of California can be sent to the Atlantic seaboard, thence to Sydney, and from Sydney 1,700 miles to Apia, and delivered here much cheaper than they can be obtained directly from San Francisco. Nearly all the kerosene consumed here comes from Sydney, though it is practically all of American production. It is claimed by traders that railroad rates to San Francisco, and water rates from San Francisco here, account for the fact that American goods do not come directly from the Pacific coast.

L. W. OSBORN, Consul-General.

APIA, June 25, 1898.

In a report dated September 30, 1898, Mr. Osborn says:

Rates from San Francisco to Samoa are \$16 per marine ton. This is practically prohibitory, especially on light and bulky goods. In many instances, the freight exceeds the cost of the goods. In a recent conversation with a gentleman representing a paper factory at or near Vancouver, I was informed that the rate by steamer on that product from Vancouver to Sydney is \$6 per marine ton, and that a marine ton of paper equals a ton in weight.

Imports and exports of port of Apia for the year ending December 31, 1897.

#### NEW CALEDONIA.1

This consular district comprises New Caledonia Island, with the Loyalty Islands to the east (7,654 square miles, population about 65,000), Uea or Wallis Island (37 square miles, population 3,500) to the northeast of Fiji, and the New Hebrides Islands (5,106 square miles, population about 75,000).

The chief port and principal city of New Caledonia is Nouméa, with a population of close to 12,000 inhabitants, nearly all white, consisting of French and English, with a few Belgians, Germans, Americans, and

other nationalities of European extraction.

Noumea being a seaport town and of exceptional cleanliness is one of the healthiest cities in the southern hemisphere. It is the safest port in the Pacific, possessing cabling, coaling, watering, and victualing facilities equal to those of any well-equipped haven of Europe. The streets are well laid out, and nowhere has macadamization reached greater perfection than here.

A fine stone quay fronting the town is in a condition suitable for receiving cargo, both for loading and discharging. Vessels of the greatest draft can lie alongside, and suitable lighting and watering installations have been provided.

The entire length of the quay, when completed, will be 2,000 feet

(1,000 are now available).

Postal, telegraphic, and telephonic communication is established throughout Noumea, and there is a complete system of watering the town by means of conduits.

An Australian company provides the city with coal gas, and a move-

ment is on foot to install electric power.

The following are objects of interest to tourists and others visiting Noumea: The cathedral, a semigothic stone structure containing some fair architecture, Le Temple Protestant, government house and gardens, the infantry and artillery barracks, the military hospital, the celebrated penitentiary of "Nou Island," La Place des Cocotiers, and the museum, containing the most complete ethnographical collection illustrative of the "Neo-Caledonian" race extant.

#### MINING.

The year 1897 was, like its immediate predecessors, remarkable for its nonprogressive tendency. New Caledonia being essentially a mining country, the want of sufficient capital and the limited demand for mineral ores during the year were hindrances to the working of its great mineral wealth, which had to be deferred, and naturally had a depressing effect on trade generally.

I learn that the enormous nickel deposits (acknowledged to be the richest in the world) were visited during the year by eminent mining engineers, whose reports on their prospective wealth have not been without result, as orders for nickel, chrome, and cobalt ores have kept

the mining population very busy of late.

French and English syndicates and a few enterprising local merchants are, at the time of writing, vying for supremacy in the export of nickel and chrome ores, and fears are entertained that if the demand for ores continues, a scarcity of labor may ensue.

#### TRADE.

The general trade of New Caledonia was, for reasons given, of a not encouraging nature. Happily, the present year has opened well and a brisk business has been done in all branches for the past six months. The steadily rising price of nickel is perceptibly felt throughout the country and is certain to have a beneficial effect on the import trade, which is now flourishing. The total value of imports and exports in 1897 was 15,724,260 francs (\$3,034,782), thus distributed: Imports, 8,679,236 francs (\$1,675,093); exports, 7,045,024 francs (\$1,359,689), showing a balance in favor of imports of 1,634,212 francs (\$315,404).

Importers are much hampered by the excessive duties levied on nearly all goods, but they manage to protect themselves by increased

prices.

#### IMPORTS FROM THE UNITED STATES.

Lumber, consisting mainly of Oregon pine and spruce, comes almost exclusively from the United States, with here and there a few thousand

Digitized by Google

<sup>&</sup>lt;sup>1</sup> Importations are generally made through houses at London, Bordeaux, or Sydney, Australia.

feet of Kaori from New Zealand. Lumber is the only article imported direct from American ports. Petroleum (no Russian oil has, to my knowledge, ever been imported here); tobacco; sewing machines; agricultural implements, which are in great demand and find a ready market; machinery; canned goods and provisions generally are also imported from America. Wheat, which, I believe, comes from America via Australia, could be imported in larger quantities if shipped direct.

The United States has hitherto not participated to any extent in the importations at New Caledonia, owing to the want of direct communication, our only drawback. Many of our articles, principally machinery and mining tools, are much appreciated on account of their cheapness,

workmanship, and finish.

My principal endeavor has been to push the importation of our goods in my consular district, but, so far, my endeavors have availed little, owing to the insuperable difficulty above mentioned.

The question of direct shipping is therefore of paramount importance

for the development of trade with the United States.

Vessels may with facility cover the distance from San Francisco to Noumea within thirty-eight days, and if an understanding be arrived at between charterers in America and parties here, a return cargo of

ores or other produce can be arranged for.

An important factor in the introduction of American products and manufactures would be the establishment at Noumea of a depot for our goods, superintended by a wide-awake agent, who should possess a thorough knowledge of French in addition to general business ability. If American firms could provide for such an establishment, the importation of our goods could be considerably increased. As a rule, Frenchmen will not buy an article without seeing it.

The terms of sale are most liberal, six, nine, and twelve months being

usually given, and no draft is accepted before the goods arrive.

#### EXPORTS.

Nickel ore.—The exports are mainly to France, Germany, and England. Chrome ore.—This is sent to England, and thence to the United States.

Cobalt.—Almost the entire quantity exported goes to Germany and England.

Mother-of-pearl shells.—Sent chiefly to France.

Pearls.2—Exclusively absorbed by European markets.

Copra.—The principal yield goes to France, Germany, and the Australian colonies.

Coffee.—Entirely exported to France.

Other produce, as indigo, vanilla, maize, etc., is variously exported to European markets.

Goods shipped to the United States are sent, for lack of direct facilities, via Sydney or England.

¹A firm in France has recently opened a branch store here for bicycles, and the undertaking has so far met with much success. Why can not Americans do likewise ¹ ²Unusually large finds were made during the past twelve months, which had as a result the formation of a number of syndicates. The representative of one of these companies produced at my office about 3 kilos (6½ pounds) of pearls, gatherings of four months. The entire quantity collected during fifteen months by the same concern was approximately 18 kilos. An apparatus for diving, likely to revolutionize the industry, has been introdeed into the colony. The inventor, a Frenchman, informs me that a descent of 200 fathoms (1,200 feet) can be made with it.

#### IMPORTS.

The following countries lead in the importation of articles specified: England.—Oils, colors, varnishes, whiskies, cotton goods, drapery, galvanized iron, steel, shoes, velvet, ribbons, haberdashery, ship chandlery.

France.—Wines, brandies, liquors, perfumery, medicines, silks, feathers, artificial flowers, boots and shoes, hardware, earthenware, canned goods, paper, ink, furniture, carriages, bicycles, zinc sheets, guns, clocks, watches, jewelry.

Germany.—Lamp glasses, toys, musical instruments, tissues, alcohol.

### TRANSPORTATION FACILITIES.

Nouméa is connected with various parts of the world by three lines of

ships, running regularly:

The Compagnie des Messageries Maritimes (French), whose fine boats call monthly direct from Marseilles, touching on their way thither at Colombo, Ceylon, Albany, Adelaide, Melbourne, and Sydney.

The E. and A. Company (British), plying between Australia and the

islands of the Pacific monthly.

The L. Ballande & Fils Ainé Company (French), a tramp line run-

ning between Newcastle, Australia, and this port.

The following vessels (steam) belonging to the Messageries Maritimes, the oldest and most powerful steamship company of France, are employed in the New Caledonian service:

Name of vessel.	Tonnage.	Horse- power.
Armand Béhis. Ville de la Ciotat Australien Polynésian Tanaïs	6, 581 6, 507 6, 506	7, 200 7, 200 7, 200 7, 200 1, 600

The first four of these steamers are fine ships.

Among the large number of sailing vessels calling at New Caledonia, the line of French clippers, averaging 4,000 tons each, and represented by a local firm, M. Berthelin & Co., may be mentioned.

PAUL EUGENE WOLFF, Commercial Agent.

Noumeá, November 1, 1898.

#### SUPPLEMENTARY REPORT.

I inclose Guide de l'Émigrant en Nouvelle-Calédonie, published by a society known here as "L'Union Coloniale Française."

As the pamphlet contains much useful and reliable information concerning my consular district, I recommend the publication of extracts therefrom, as this colony appears to be little known in the United States and is even frequently confounded with the French penal possessions in the West Indies.

No American vessels entered this port during the quarter ending September 3, 1898. As a result of the increased demand for nickel ore, with which this consular district abounds, and of a loan of several million dollars incurred by the local government for public works, a railroad, wharves, and a dry dock, a decided improvement in affairs has taken place since the beginning of September. I hope that these new conditions will enable me to introduce numerous articles of American manufacture (the superiority of which over foreign articles is acknowledged throughout this island), notwithstanding an obstinate opposition which a section of the community here is bound to make to such introduction, fears being entertained by many that if we once gain a footing, American goods will carry everything before them. This applies especially to machinery, tools, mining implements, and hardware generally, of which considerable quantities are used.

The following items are among articles chiefly employed: Shovels, long handled (plain back and back strap); ordinary shovels (plain back and back strap); picks, prospectors, and poll; hammers, striking, "Nevada pattern," and napping, or rock breaking; adzes, railroad; axes, long handled (single bit); hatchets (claw).

The imports of hardware in general amounted to close on \$500,000

yearly during the past seven years.

It frequently happens that manufacturers send circulars and other literature concerning their goods. These, to begin with, if not in the French language, are useless here, and I wish to add that, in my opinion, such a mode of introducing goods is a failure nine times out of ten.

The best way is to send commercial travelers; failing this, I would recommend the forwarding of samples. British, French, and German houses usually succeed in introducing their products from the start by equipping a well-trained traveler with specimens of their goods, which are effectively placed before the dealers. Should this latter course be found inconvenient or impracticable in regard to New Caledonia, this agency will undertake the task of introducing such goods with the least possible delay.

PAUL EUGENE WOLFF, Commercial Agent.

Nouméa, November 1, 1898.

#### [Extracts from "Guide de l'Émigrant en Nouvelle-Calédonie."]

New Caledonia, a mountainous and picturesque island of the Southern Pacific, 249 miles long and 31 wide, is situated about 250 miles southwest of the New Tabelda and a little over 1000 miles from the eastern coast of Australia. The Hebrides and a little over 1,000 miles from the eastern coast of Australia. climate is salubrious, very like that of the south of France, combining the advantages of temperate and tropical countries. From December to March, the period of the greatest heat, the island is liable to be visited by violent windstorms or cyclones,

often causing great damage.

The soil, well watered and fertile, lends itself readily to the cultivation of most European and certain exotic plants, notably coffee. From March to November all the vegetables of France may be cultivated, and of potatoes two crops a year may be taken from the same ground. The principal fruits are oranges, lemons, mandarins, bananas, mangoes, guavas, peaches, strawberries and raspberries.

The population of New Caledonia is as follows:

Native	30,000
Civil and military	
Penal	11,000
Laborers	4,000

The question of manual labor, always of great importance in an agricultural colony, may be considered as settled by the introduction of workmen from Java and Annam. The native population is peaceable when treated with justice and kindness, but can not be depended upon for continuous work. Gangs of discharged convicts can be engaged by contract to clear the woodlands, at prices varying from \$4.50 to **\$9** per acre.

La Foa, with about 1,000 inhabitants, is the most important agricultural center. Bourail and Pouembout are almost exclusively penal settlements. Moindon is a

small place, whose inhabitants are mostly engaged in the cultivation of coffee.

The means of communication throughout the island are elementary, but sufficient for the wants of the colony. The total length of roads practicable for wagons is hardly 125 miles, but owing to the configuration of the island, transportation of every hind is capilled for the configuration. kind is easily effected by water.

There is a regular steamboat service every fifteen days between the chief town and the principal places on the coast; other boats make the tour of the islands. Besides the semiweekly postal service, all important agricultural centers are united with Noumea by telegraph. Noumea and its environs have a telephone service. There is also cable communication with France and the United States at \$2.50 per word.

To emigrants with small capital desirous of engaging in agriculture, the Union Coloniale Française offers special inducements, such as free transportation, grants of land, etc. It would seem, however, that the basis of all agricultural cultivation must be coffee. The extent of land suitable for coffee plantations is estimated at 494,200 acres, and about 1,000 plants can be planted to the acre. The actual production is still restricted. The following figures, taken from the customs statistics, show the increase in exportation for three years:

Year.	Quantity.	Value.
1893. 1894. 1895.	302, 050	\$17, 017 52, 885 111, 911

#### At the same time there were imported:

Year.	Quantity.	Value.
1893	Pounds. 31, 418 3, 020 71	\$5, 605 526 12

The quality of the New Caledonian coffee leaves nothing to be desired; it is not inferior to that of Réunion or of the Antilles. The market price varies from 24 to 25 cents a pound, which is remunerative to a landowner with a plantation in full bearing. There is always a market at Noumea, and certain houses even send agents to the plantations to buy the coffee at the harvest time. Contrary to the experience of most coffee-producing countries, the coffee plant of New Caledonia is subject to no maladies, and even the grasshoppers do not attack it. It is only necessary to protect the plants from the burning sun.

After having tried various native shrubs, planters have adopted the Acacia Lebbeck, which grows rapidly and has the further advantage that at the blossoming time of the coffee plant its leaves fall, so that nothing prevents the rays of the sun from reaching the plant. The fallen leaves furnish an excellent manure. Under these trees, the soil demands little or no cultivation, an annual weeding being sufficient to keep a plantation in perfect condition. During the first and second years maize, tobacco, and beans may be cultivated between the rows of coffee plants, but after that time it is better not to make any secondary cultivation.

Tobacco is successfully grown in all the agricultural centers. In favorable years, two to three harvests are made from the same stalk. An acre of ground yields from 1,500 to 2,000 pounds, which sells, according to quality, for 6½ to 9 cents per pound. Both indigo and cotton are indigenous, and can be cultivated with the greatest

Both indigo and cotton are indigenous, and can be cultivated with the greatest

facility.

The different varieties of cocoanut trees found on the island have been planted by the natives. These trees commence yielding at the age of 8 to 10 years, giving annually 50 to 80 nuts. The kernels, dried in the sun, are readily sold at from \$38 to \$42 a ton.

Maize, rice, and all cereals can be cultivated, but on account of the ravages of the

grasshoppers the harvests, can not be depended upon.

The following figures will give an idea of the price of different agricultural tools in New Caledonia: Plows, iron, \$27 to \$58; plows, wood, \$16 to \$19; harrows, \$9.50 to \$12.50; ox carts, \$77 to \$95; wheelbarrows, \$3.40 to \$4.80; spades, with handles, 96 cents; hoes, 53 to 86 cents; shovels, 77 cents; pickaxes, 77 to 86 cents; axes, with handles, \$1.54; hatchets, 77 cents; saws, 96 cents. Prices of provisions are as follows, per kilo (2.2046 pounds): Bread, 8 to 10 cents; fresh meat, 14 to 24 cents; salted meat, 15 to 19 cents; dry beans, 9 to 14 cents; potatoes, 3 to 4 cents; white sugar, 19 to 24 cents; brown sugar, 12 to 14 cents; green coffee, 53 cents: tea, 63 to 96 cents; wine, ordinary, 15 to 19 cents the liter (1.05 quarte); petroleum, 7 to 9 cents a liter.

### SOCIETY ISLANDS.

As usual, the United States heads the list of both imports and exports in 1897, showing that the bulk of the trade is still ours, notwithstanding the strong efforts made by the Australian colonies, and more particularly by New Zealand, to secure a share, efforts which have met with a certain measure of success, owing to the excellent transportation facilities provided by the latter country. Australian trade with this colony is next to that of the United States in value, and the two combined absorb more than one-half of the entire trade.

The commerce of New Zealand with this colony has steadily grown, showing during 1897 an increase over 1896 of \$57,828, while that of the United States is \$69,624. The increase of imports from New Zealand is only \$11,796 less than that from the United States. I would remark that a certain amount of this increase is due to the enterprise

of Sydney and Melbourne merchants.

The United States has so long enjoyed the benefit of the trade of these islands that the merchants of San Francisco, more particularly, have become apathetic, and do not show the energy displayed by our British and colonial cousins, who more than ten years ago subsidized a steamship line, to which in a great measure the increased trade is to be attributed. There can be no doubt that the proposed communication offered by the Polynesian Steamship Company between San Francisco, Honolulu, and Tahiti will give the necessary impetus to our commerce.

#### TRADE.

The increase of this year's imports is due to a great extent to the expectation of a brisk trade in produce, such as mother-of-pearl shells, vanilla, and copra, expectations, unfortunately, which were not realized.

Copra.—The export of this article has decreased by 900 tons, of a net value of \$36,000, owing to the ravages of the cocoanut blight in this and the Paumotu group; also to the fact that in some of the latter islands, the natives preferred to dive for shells rather than make copra.

Mother-of-pearl shell.—There has been a falling off in the output of this valuable article of export, notwithstanding the high prices ruling for the black-edged Tahiti shell in the European and other markets. Precautionary measures have been taken by local authorities to prevent the destruction of these valuable fisheries, only so many lagoons being declared open for diving. In the year 1897, these were not as prolific as in the year 1896, when one of the most productive lagoons (Hikieru) was open. The lack of good shell islands caused a deficit of some 140 tons, valued at \$10,000.

The exportation of this article is not likely to show an increase unless similar lagoons are opened before the beginning of the diving season, in October, 1899, when, no doubt, a marked increase will be shown.

Vanilla.—This article has shown a rapid increase, both in value and quantity, owing to the partial failure of the crops at Bourbon and Seychelles. The increase in export was 16,600 pounds, or \$95,000. The prices ruling, however, can not be sustained, because of the large acreage planted, and the careless manner of picking and preparing the beans. There is a great lack of knowledge as to proper preparation of the beans, so that the essential oil shall not exude through the skin. With improved methods, the value will be materially enhanced. More than two-thirds of the crop finds its way to the San Francisco market.

Preserved meats.—During the past year, the Australian meats have almost entirely superseded those from Chicago and other places, owing to the superiority of the goods. The merchants in the United States imagine anything good enough for these islands, and it is owing greatly to this spirit that they are likely to lose some of their trade in the Pacific. There is no more particular buyer than the native here; for instance, New Zealand soap of a certain grade is much superior to the San Francisco article, and yet in spite of its higher price, it is sought after by many natives who have found out its cleansing properties. New Zealand can not compete in cheap soaps, owing to the high price of resin in the colonies.

Dry goods.—A large proportion of this trade is still held by the United States, i. e., in denims, drills, narrow prints, muslins, white calicoes, etc. San Francisco merchants act as middlemen between the manufacturer and the island trader, and keep prices up accordingly. There would appear to be an opportunity to increase the consumption of these goods by more direct communication between the manufacturer and the island merchants.

Wine.—The California article has rapidly gained a good reputation,

and has superseded wines from France in a marked manner.

Sugar.—It seems incredible that this island, the home of the cane, does not produce enough for its own consumption, notwithstanding the production is protected by a duty of 0.25 centimes per kilogram, equal to about \$47 gold per ton. Coffee grows wild almost within a few feet of the salt water, but on this there is no protective duty.

#### CURRENCY.

The money in circulation is almost entirely Chilean and Peruvian; the French franc, however, is the coin recognized by the authorities, and all duties and taxes must be paid in that currency. Exchange does not fluctuate to any great extent now, the peso or sol having its intrinsic value in silver of 42 cents gold. Most of the houses here render their accounts in French money, but owing to the scarcity of that coin, accept the equivalent in Chilean pesos or Peruvian soles. Freights and passages are payable invariably in French coin or notes of the Caisse Agricole, which are guaranteed by the authorities.

In conclusion, I would say that in my opinion, a large field is open in these islands for American capital, energy, and enterprise as soon as

steam communication and the cable shorten the distance.

Although no doubt an influx of foreign capital would be looked upon with a jealous eye by French and other industrials, the local government would regard the introduction of capital with a favorable eye, and do its utmost to aid any efforts to animate this so-called "Sleepy Hollow," where nature has done so much and man so little; where all tropical and semi-tropical fruits and products grow in such profusion.

A few years ago, a savant brought to this island a great number of trees, shrubs, and plants, useful and ornamental. These can be found growing to day under great disadvantages in a soil not suited to all of the trees, and not properly planted; yet one and all have thriven, many better even than in the countries whence they were brought. The drawbacks here are lack of suitable labor (which could be imported with the aid of the Government) and of capital, which, if judiciously expended, would without doubt give good return.

#### CLIMATE.

This is one of the finest semi-tropical climates in the world, the sea breeze rendering it comparatively cool in the hot season, which is from November to the end of March.

#### HOTELS, ROADS, ETC.

There is no reason why the passenger traffic should not increase to an enormous extent as soon as proper hotels and accommodations for the traveling public are provided. At present, no suitable establishments exist, at any rate not as Americans understand them. The roads are excellent; much better than those of California. A good cyclist can easily make 60 miles a day.

#### POPULATION.

The native inhabitants are independent, possess good houses, wagons, boats, sewing machines, and bicycles. Poverty among them is unknown. I can not say they are fond of hard work, but they are equal to it when they find it necessary; they work for the foreigner only if it pleases them. The task of obtaining feüs, or mountain plantains, requires great strength and endurance, and is performed once a week.

The actual labor available here consists almost entirely of natives of the Cook Group, and other islands under British protection. An ordinary day laborer receives from \$1.50 to \$2, Chilean coin (63 to 84 cents gold). Domestic servants are difficult to obtain, and wages run from \$25 to \$45, Chilean (\$10.50 to \$18.90 gold), per month, with board.

Harbor is excellent, easy of ingress and egress at all times. The steamer of the Union Steamship Company of New Zealand, plying between this port and New Zealand, frequently enters the port at night, although the lights are by no means bright.

JNO. HART, Vice-Consul.

TAHITI, October 10, 1898.

#### DECLARED EXPORTS, SOCIETY ISLANDS.

Value of exports declared for the United States at Tahiti during the year ended June 30, 1898.
